# GUIDE TO PSYCHOLOGICAL ABSTRACTS INFORMATION SERVICE

This pamphlet describing PAIS will be mailed to all *PA* subscribers in February 1975.

## PAIS provides...

### **Psychological Abstracts**

Contains over 25,000 abstract records of relevant psychological literature. 12 issues plus indexes.

### **Cumulative Subject and Author Index to Psychological Abstracts, 1972-74**

Consolidates information on authors and abstract records that appeared in 36 monthly issues of *PA*.

### **Thesaurus of Psychological Index Terms**

Contains over 4,000 terms representing the primary concepts used in psychology.

### **PASAR (Psychological Abstracts Search and Retrieval)**

Provides the individual researcher with information on a particular topic as published in *PA* since 1967.

### **PATELL (Psychological Abstracts Tape Edition Lease and Licensing)**

Provides computer tapes of all *PA* records since 1967 for the Institutions' use on computer.

### **PADAT (Psychological Abstracts Direct Access Terminal)**

Provides information across many data bases through hook-up with Dialog<sup>®</sup> Information Retrieval Service.

*Psychological Abstracts (PA)* provides nonevaluative summaries of the world's scientific literature in psychology and related disciplines. Over 800 journals, technical reports, monographs, and other scientific documents provide material for coverage in *PA*. About 20% of the records published in *PA* are bibliographic citations or annotations which are used to cover books, articles peripherally relevant to psychology, or articles that can be represented adequately in approximately 30-50 words.

Each monthly issue contains abstracts listed under 17 major classification categories, with some categories having subsections, as shown in the Table of Contents. The abstracts are arranged in alphabetical order by author under the headings and are numbered consecutively in the two volumes produced each year.

Abstracts of articles contained in a single issue of a journal covered by *PA* occasionally may appear in different issues of *PA*. For example, if a journal issue contains 20 articles, abstracts for 17 of these articles may appear in one issue of *PA*, the other three in a later issue.

*PA* records published since 1967 are now on machine readable tapes which provide the basis for automated search and retrieval services known as *Psychological Abstracts Information Services (PAIS)*. For more information on *PAIS* products, uses, and costs write to *PAIS*, American Psychological Association, 1200 Seventeenth Street, N.W., Washington, D.C. 20036.

PUBLISHED MONTHLY BY  
THE AMERICAN PSYCHOLOGICAL ASSOCIATION  
1200 SEVENTEENTH ST., N.W., WASHINGTON, D.C. 20036

Second-class postage paid at Washington, D.C., and at additional mailing offices.

MANAGING EDITOR: Harold P. Van Cott

MANAGER, PUBLICATIONS BUSINESS SERVICE: Mr. Lynn D. Spier

Correspondence on production or editorial matters should be directed to the Executive Editor *Psychological Abstracts*; on copyright matters, to the Managing Editor; on advertising and sales, to the Manager, Publications Business Service; and on subscriptions and address changes, to the Subscription Office. All correspondence should be addressed to the American Psychological Association, 1200 Seventeenth Street, N.W., Washington, D.C. 20036.

Address changes must reach the Subscription Office by the tenth of the month to take effect the following month. Copies undelivered because of address change will not be replaced; subscribers should notify the post office that they will guarantee second-class forwarding postage. Other claims for undelivered copies must be made within 4 months of publication.

*Psychological Abstracts* is published monthly, with two volumes per year. Each volume contains approximately 12,000 records. *Volume Cumulative Indexes* are published under separate cover. Total subscription price per year is \$190 (non-US, \$192).

## KEY TO THE TEXT

The examples of different types of *Psychological Abstracts* records presented here are number coded to provide definition of their elements.

### JOURNAL ARTICLE ABSTRACT

<sup>1</sup>8327. <sup>2</sup>Howard, R. Lee.; Glendenning, Robert L. & Meyer, Donald R. <sup>3</sup>(Ohio State U) <sup>4</sup>Motivational control of retrograde amnesia: Further explorations and effects. <sup>5</sup>*Journal of Comparative & Physiological Psychology*, 1974(Feb). Vol 86(2), 187-192. <sup>6</sup>Reports 5 investigations of variables related to the motivational control of retrograde amnesias for long-term habits, which result from single electroconvulsive shock treatments. Ss were 176 Long-Evans rats. In terms of the paradigms of M.J. Robbins and D.R. Meyer (see PA Vol 44:11961), habits that were 3rd in a series were generally resistant to the treatment and were markedly impaired if the tests for retention were carried out in changed motivational contexts. The latter result is discussed in relation to the view that long-term habits are affected by the treatments if and only if, they operate as punishments. (8) <sup>9</sup>(15 ref) <sup>10</sup>*Journal abstract*.

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Affiliation of first-named author/editor only.
- 4 - Article title, including subtitles: If the original article is in a foreign language, the translated title is given in brackets and the language of the original article is indicated in parentheses.
- 5 - Primary publication title and bibliographic data.
- 6 - Text of abstract.
- 7 - Reference to a previous entry in *Psychological Abstracts*. If an abstract number is unavailable at time of publication, the issue number is given. Consult the Author Index of the PA issue noted in order to determine the record number for the article.
- 8 - Summaries included in the primary publication are listed when in language(s) other than that of the article.
- 9 - Number of references is included when there are 15 or more listed.
- 10 - Abstract source.

### BOOK ANNOTATION

<sup>1</sup>8328. <sup>2</sup>Chase, William G. <sup>3</sup>(Ed). <sup>4</sup>(Carnegie-Mellon U) <sup>5</sup>Visual information processing. <sup>6</sup>New York, NY; <sup>7</sup>Academic, <sup>8</sup>1973. <sup>9</sup>xiv, <sup>10</sup>555 p. <sup>11</sup>\$17.50. <sup>12</sup>Presents a series of readings on visual processes in cognition and linguistic comprehension and on information-processing models.

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Designation of editor.
- 4 - Affiliation of first-named author/editor only.
- 5 - Book title: If the book is in a foreign language, the original title is given followed by a translated title and the language of the book is indicated in parentheses.
- 6 - Place of publication.
- 7 - Publisher.
- 8 - Year of publication.
- 9 - Prepagination.
- 10 - Total pagination.
- 11 - Price.
- 12 - Text of annotation.

### BOOK CHAPTER CITATION

<sup>1</sup>8329. <sup>2</sup>Clark, Herbert H.; Carpenter, Patricia A. & Just, Marcel A. <sup>3</sup>(Stanford U) <sup>4</sup>On the meeting of semantics and perception. <sup>5</sup>In W.G. Chase (Ed), *Visual information processing*, New York, NY: Academic, 1973. xiv, 555 p. \$17.50.

- 1 - Record number.
- 2 - Author(s) of cited chapter. As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Affiliation of first-named author only.
- 4 - Chapter title.
- 5 - Referral to the whole book and its bibliographic data.

## CONTENT CLASSIFICATION

PA has subsections for some of the 17 major classification categories. These are displayed in the Table of Contents and are designed to group all abstracts relevant to a narrower topic than the major categories under a single heading. Abstracts that are relevant to a major category but not to any of the subsections are listed first and followed by abstracts that are relevant both to a major category and also to the subsections. It is expected that this will help readers locate material related to their interests more quickly.

## ABBREVIATIONS

In addition to commonly understood abbreviations\* (including all units of measurement, educational degrees, standard statistical abbreviations, and standard Latin and reference terms), standard abbreviations used in *Psychological Abstracts* records are:

ACTH	= adrenocorticotrophic hormone	NREM	= nonrapid eye movement
DNA	= deoxyribonucleic acid	REM	= rapid eye movement
E	= experimenter	RNA	= ribonucleic acid
EEG	= electroencephalogram or -graph	S	= subject
ESP	= extrasensory perception	TV	= television
Exp	= experiment	US	= United States
IQ	= intelligence quotient	USSR	= Union of Soviet Socialist Republics
LSD	= lysergic acid diethylamide	WAIS	= Wechsler Adult Intelligence Scale
MMPI	= Minnesota Multiphasic Personality Inventory	WISC	= Wechsler Intelligence Scale for Children

Computer languages and computer names will also be used without definition, e.g., ALGOL, COBOL, FORTRAN, IBM 360.

Language abbreviations used after translated titles are:

Afri = Afrikaans	Geor = Georgian	Port = Portuguese
Alba = Albanian	Germ = German	Romn = Romanian
Arab = Arabic	Grek = Greek	Russ = Russian
Bulg = Bulgarian	Hebr = Hebrew	Slov = Slovene
Chin = Chinese	Hung = Hungarian	Slov = Slovak
Czec = Czech	Iran = Iranian	Span = Spanish
Danh = Danish	Ital = Italian	Ser = Serbo-Croatian
Duth = Dutch	Japn = Japanese	Swed = Swedish
Finn = Finnish	Lith = Lithuanian	Turk = Turkish
Flem = Flemish	Norg = Norwegian	Ukrn = Ukrainian
Fren = French	Polh = Polish	Yugo = Yugoslavian

# PSYCHOLOGICAL ABSTRACTS

Volume 53

January 1975

Number 1

## GENERAL

1. ———. **Digests of papers: Fifty-first annual meeting: American Orthopsychiatry Association, San Francisco, California, April 8-12, 1974.** *American Journal of Orthopsychiatry*, 1974(Mar), Vol 44(2), 180-297.—Includes papers on such topics as rape, sterilization, female psychotherapy, drug abuse, therapy with the poor, family therapy, school psychology, day care, crisis intervention in the ghetto, and community mental health.

2. Altman, Fred & Miller, Suzanne P. (National Inst. on Drug Abuse, Rockville, Md.) **A matching-to-sample procedure for the study of visual perception and concept formation in infrahumans: A test in the pigeon.** *Behavior Research Methods & Instrumentation*, 1974(May), Vol. 6(3), 312-316.—Details an apparatus suitable for conducting simultaneous or delayed matching-to-sample experiments with as many as 8 comparison stimuli. Data are presented from an experiment with 4 male Carneaux pigeons which indicate that the Ss were capable of performing such a task. It is concluded that the simultaneous matching-to-sample procedure with more than 2 comparison stimuli is an efficient means of obtaining information about discrimination capacity and that this procedure may be suitable for studying visual perception in infrahuman Ss.—*Journal abstract*.

3. Attneave, Fred. (U Oregon) **How do you know?** *American Psychologist*, 1974(Jul), Vol 29(7), 493-511.—Discusses the problem of how humans acquire knowledge. 2 types of representation of the external world are considered—in digital representations (e.g., language), relations are represented by substitute things (words), whereas in analog representations (e.g., maps), items are represented by their spatial interrelationships. The basis for knowing how can be represented as a stimulus-response-stimulus linkage; it is only by doing things that change one situation into a more favorable one that the organism can affect his chances of survival. It is considered that many human psychological functions entail analog representations, particularly the system for representing physical space. The theoretical advantages of assuming assuming tridimensional analog model of physical space are discussed, and evidence for this model is presented. The question of whether images exist in memory as picturelike forms and/or languagelike descriptions is considered. (21 ref)—*A. Olson*.

4. Braginsky, Benjamin M. & Braginsky, Dorothea D. (Wesleyan U) **Mainstream psychology: A critique.** New York, NY: Holt, Rinehart & Winston, 1974. xv, 206 p.—Analyzes the predominant theories, research, and practice of contemporary American psychology. The roles of the psychologist as technician, moralist, and

scientist; the sociology of psychology; the methods and theory of behaviorism and of humanism; and psychological diagnosis and psychotherapy are examined. (9 p ref)

5. Brown, Phil. **Toward a Marxist psychology.** New York, NY: Harper Colphon, 1974. xix, 186 p. \$2.95.—Proposes that psychiatrists, psychologists, and allied professionals are engaged in subtle forms of brutality, integrally related to the brutalities of capitalism. The theory and practice of revolution is urged as a solution, choosing dialectics over scientism and discussing a medical model of mental illness, the failure of the Marx-Freud synthesis, W. Reich and sexual-political struggle, and the psychology and revolution of F. Fanan. (8 p ref)

6. Carpenter, Finley. (U Michigan) **The Skinner primer: Behind freedom and dignity.** New York, NY: Free Press, 1974. xvi, 224 p. \$7.95(cloth), \$2.45(paper).—Answers critics of Skinner's *Beyond Freedom and Dignity*, examining his position on freedom in clear, nontechnical terms, acknowledging the book's plausible parts, and identifying its shortcomings. The relationship between freedom and education is explored.

7. Carroll, John. (La Trobe U, Bundoora, Vic, Australia) **Break-out from the crystal palace: The anarcho-psychological critique: Stirner, Nietzsche, Dostoevsky.** Boston, MA: Routledge & Kegan Paul, 1974. 188 p. \$15.—Traces the development of the anarcho-psychological critique of economic man, of all codes of ideology or absolute morality, and of scientific thought from its roots in 19th-century philosophy to the works of Stirner, Nietzsche, and Dostoevsky. Their critiques of the other 2 major social philosophies—liberal-utilitarian-rationalist and Marxist-socialist—are discussed, and the roles of technology and the individual in these 3 philosophical traditions are examined. (7 p ref)

8. Chaplin, James P. & Krawiec, T. S. (St Michael's Coll) **Systems and theories of psychology.** (3rd ed). New York, NY: Holt, Rinehart & Winston, 1974. x, 739 p.—Discusses the evolution of the various schools of psychology and details concepts of sensation, perception, learning, thinking and language, motivation, feeling and emotion, behavior, and personality. (37 p ref)

9. deMause, Lloyd (Ed.). **The history of childhood.** New York, NY: Psychohistory Press, 1974. ii, 450 p. \$12.50.—Presents a survey by 10 psychohistorians concerning childhood from the late Roman and early medieval periods to middle-class nineteenth century in Europe and America.

10. Diamond, Solomon. (California State U, Los Angeles) **Four hundred years of instinct controversy.** *Behavior Genetics*, 1974(Sep), Vol 4(3), 237-252.—Although most issues of the instinct controversy were defined in the 17th century, 18th-century French enlightenment vigorously rejected the concept. Natural

theology and Darwinism led to wide acceptance of instinct in the 19th century, but the 20th century witnessed a revival of anti-instinct attitudes. Extraneous influences still impede recognition of scientific evidence for the importance of innately determined behavior. (80 ref)

11. Ebel, Robert L. (Michigan State U, Coll of Education) **And still the dryads linger.** *American Psychologist*, 1974(Jul), Vol 29(7), 485-492.—Ancient ancestors invented dryads, or tree nymphs, to explain what they could not otherwise understand. It is argued that hypothetical constructs serve the same function for some contemporary behavioral scientists. Constructs such as intelligence, motivation, and creativity become modern dryads when used to explain behavior rather than simply to describe it. To be scientifically useful a hypothetical construct must be validated. This means that it must be shown to be functionally related to some behavioral variable(s) other than the one it was invoked to explain. It is concluded that few of the hypothetical constructs in the behavioral sciences have met this test and that those that cannot meet the test should be abandoned. (19 ref)—*Author abstract.*

12. Emiling, John F. (U Dayton) **In the beginning was the response.** *Religious Education*, 1974(Jan), Vol 69(1), 53-71.—Emphasizes J. Piaget's history, and the background of the times in which his genetic epistemology came into being, as a basis for understanding its influence. Piaget's position, enunciated, developed, and appraised, has important implications for the learning process today.—*E. Gavin.*

13. Eriksson, Carl-Gunnar . **On the ecological approach in social science.** *Goteborg Psychological Reports*, 1973, Vol 3(14), 36 p.—Considers that the ecological approach leads to basic consideration of epistemological principles and metatheoretical positions on changing units of analysis. The aggregation bias—the effects of grouping data instead of analysis of individual units—is discussed in bivariate models and briefly in more complex models. It is argued that both theories on the micro- and macrolevels are needed, together with cross-level theories. Fallacies in interpreting findings on different levels are discussed, and suggestions for future ecological studies are given in a discussion of input and output variables. A study of the effects of aggregation is outlined. (9 p ref)—*Journal abstract.*

14. Phaner, Stig & Sjöberg, Lennart. **Measurement in differential psychology: A symposium.** *Göteborg Psychological Reports*, 1973, Vol 3(6), 42 p.—Summarizes papers on (a) latent trait theory, including conditional estimation in the Rasch model and dimensionality in a latent trait model; (b) generalizability of behavioral data, including the construct validity of tests and empirical studies in differential psychology; and (c) measurement of change, including models and estimation methods and path models with latent variables.

15. Frank, Robert . **[Scientific value and the ideological role of psychology.]** (Fren) *Revue de Psychologie et des Sciences de l'Éducation*, 1973, Vol 8(3), 325-353.—Suggests that the unity in the diverse activities of psychology lies in its effort to make the human subject an object of knowledge. It is this epistemological ambiguity that permits psychology to fill its ideological

role, that of relating man to his institutions, and thus achieve a totality.

16. Gomes de Araújo, H. A. **Phenomenological perspectives in existential analysis.** *Foreign Psychiatry*, (Win), Vol 2(4), 22-49.—Distinguishes between "life," which moves forward of itself, and "existence," which implies experiment and decision and is linked to the concept of "essence." Of all organisms, man alone exists and knows that he exists. He also knows that his existence is finite, (i.e., that he will die). He can comprehend biological termination but cannot actually imagine an end to existence, to his internal dialogue with himself. His awareness of being finite drives him into action that would never be taken if he were immortal; human existence is a function of death, which limits man's horizon in time and gives meaning to what it limits. Man has devices to compensate for inescapable and intolerable realities: the drive for self-immortalization, which requires him to plan and follow a "program of existence"; compensatory illusions such as disbelief in his finiteness; neutralization through love; and transcendence, the establishment of links with the outside world. These concepts and their ramifications are expounded in detail.—*I. Davis.*

17. Green, T. R. & Guest, D. J. (MRC Social & Applied Psychology Unit, U Sheffield, England) **An easily-implemented language for computer control of complex experiments.** *International Journal of Man-Machine Studies*, 1974(May), Vol 6(3), 335-359.—Details the main features of GLUE, Generalized Languages for Universal Experimentation, a computer language which allows the implementation to proceed in 3 stages, of which only the 1st requires assembly-code programming. An example demonstrates the programming of an algorithm for parsing with respect to context-free phrase-structure grammars.

18. Greenfield, Jerome . (State U New York, New Paltz) **Wilhelm Reich vs the U.S.A.** New York, NY: W. W. Norton, 1974. 380 p. \$10.—Describes the legal conflict between W. Reich and the Food and Drug Administration (FDA) over Reich's attempt to distribute an experimental device for accumulating orgone energy. A brief review of Reich's theories is included, and the harassment of Reich by the FDA from the preliminary investigation to his appeal to the Supreme Court is described. Legal briefs and reports of FDA investigations of Reich's device are appended.

19. Hall, Elizabeth . **Why we do what we do: A look at psychology.** Boston, MA: Houghton Mifflin, 1973. 184 p. \$5.95.—Discusses modern psychology in terms of what it is, the techniques it uses, and the kinds of knowledge it has added to the understanding of human relationships. These discussions cover general areas of psychology—motivation, emotions, learning, personality, persuasion, and adjustment—and are related to experiences in everyday living.

20. Handy, Rollo & Harwood, E. C. (Behavioral Research Council, Great Barrington, MA) **A current appraisal of the behavioral sciences.** (Rev ed). Great Barrington, MA: Behavioral Research Council, 1973. xi, 148 p.—Presents an analysis of the state of modern scientific inquiry and procedures of research on human behavior in the field of psychology, anthropology,

sociology, political science, economics, law, game and decision theory, and cybernetics. An appendix on scientific naming is included.

21. Hühne, A. & Maurus, M. (Max-Planck-Inst for Psychiatry, Munich, W Germany) **Semiautomatic conversion of behavioral data from film to paper tape for computer analysis.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 317-319.—Describes a device which facilitates, in 1 step, the conversion of behavioral data. Time data is automatically read off the film by forward or backward replay at various speeds and any number of time-overlapping or multiple-occurring parallel behavioral events can be recorded.

22. Humphrey, Robert L. (American Inst for Research, Pittsburgh, PA) **Scientific ethic, dual life value: Theory & ramifications.** San Diego, CA: Grossmont Press, 1974. 64 p.—Presents a synthesis of R. L. Humphrey's philosophy and program for resolving difficult cross-cultural and human relationships: the dual-life-value theory. Such basic principles as man's nature and reason, economic and political equality, freedom and democracy, domestic and international aid, birth control, and the use of killing force and the military are discussed.

23. Illingworth, G. & Terman, M. (Northeastern U) **Phase locked loop: An application in temperature telemetry and a method for its evaluation.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 335-338.—Outlines the application of a phase locked loop (PLL) in the front end circuitry of a temperature telemetry system. Some of the features inherent in PLL operation are discussed which make them more powerful than a Schmitt trigger circuit and applicable to analysis of many types of frequency signals. A simple method is developed whereby PLL behavior can be optimized.

24. Ito, T. & Furuya, M. (JASDF Aeromedical Lab, Tokyo, Japan) **[A study of behavioral analysis of pilot during aircraft controlling: II. In-flight recording equipments and methods of installation for T-34, T-1A (B) and T-33A.]** (Japn) *Reports of Aeromedical Laboratory, JASDF*, 1973(Jun), Vol 14(1), 7-13.—Describes different types of inflight audiovisual recording equipment and methods of installation used to study pilot behavior. Specifications are presented for 8 mm cameras for filming outside scenes, flight instruments, and pilot actions; memo-motion timers for time control and synchronization; audio recorders for pilot oral presentation and air traffic controller responses; and the appropriate remote switch and cable assemblies. —English abstract.

25. Konijn, H. S. (Tel-Aviv U, Israel) **Statistical theory of sample survey design and analysis.** New York, NY: American Elsevier, 1973. xv, 429 p. \$32.50.—Presents a textbook for both students and professionals on procedures of sampling methodology and analysis. Topics include simple random sampling; ratio and related estimators in simple random sampling; stratified sampling; selection of sampling units; cluster sampling; nonsampling errors; and repeated surveys.

26. LeShan, Lawrence. **How to meditate: A guide to self-discovery.** Boston, MA: Little, Brown, 1974. 210 p. \$5.95.—Presents a practical guide to meditation, including specific exercises and programs drawn from the

practices of Zen, Sufi, Yoga, and Christian and Jewish mysticism. Other topics include the psychological and physiological effects of meditation, advice on choosing a teacher for meditation, the role of meditation in psychotherapy, and the social significance of the meditation and self-discovery movements. (4 p ref)

27. Maurer, Adah. (Committee to End Violence Against the Next Generation, Berkeley, CA) **Corporal punishment.** *American Psychologist*, 1974(Aug), Vol 29(8), 614-626.—Presents a 2-part examination of the literature on corporal punishment in which J. M. Johnston's analyses of the laboratory literature (see PA, Vol 50:231) are contrasted with field study literature. It is suggested that laboratory investigators have underemphasized the reality of educational and child-rearing customs while field study investigators have underemphasized the scientific aspects of their efforts. Part 1 presents an historical and psychological view of the development of the word "punishment." Special emphasis is given to the idea that punishment terms carry markedly different meanings depending on the context and the user. Part 2 concentrates on some of the theories of punishment. (151 ref)—M. Pounsel.

28. Mazur, Allan & Robertson, Leon S. (Syracuse U) **Biology and social behavior.** New York, NY: Free Press, 1974. vii, 200 p. \$2.45.—Presents a summary of the literature on the interaction of biological, psychological, and social factors in human behavior. Interspecies comparisons, intraspecies comparisons, and biological manipulations are discussed in the areas of language, genetics, hormone systems, socialization, brain alteration, and drugs. (25 p ref)

29. McMahon, Frank B. (Southern Illinois U, Edwardsville) **Psychology, the hybrid science.** (2nd ed.). Englewood Cliffs, NJ: Prentice-Hall, 1974. xv, 672 p.—Presents the 2nd edition of an introductory psychology textbook for undergraduates, emphasizing the interdisciplinary nature of psychological theory and research. Topics include the beginnings of psychology, the relationship of psychology, biology, and physiology, perception and psychology, measuring intelligence and personality, and the causes and treatment of mental illness. (41 p ref)

30. McNeil, Elton B. (U Michigan) **The psychology of being human.** San Francisco, CA: Canfield, 1974. xvi, 715 p. \$11.95.—Presents an introductory psychology textbook which incorporates a wide range of theoretical viewpoints and includes the work of all schools of psychology: behavioral, developmental, clinical, comparative, physiological, and humanist. Psychological jargon is minimized, and emphasis is placed on such topics as aging and death, sex, styles of living, consciousness, and the "world of work." (24 p ref)

31. Nagaraja, Jaya. **Evolution of psychiatry in India.** *Child Psychiatry Quarterly*, 1973(Jan), Vol 6(1), 18-19.—Traces the evolution of psychiatry from the folk-life of India. There is tangible evidence of its existence years prior to its practice in the West. There was social security and partnership, and milieu-conscious management operated at the communal level on the principles of what was "good" and "bad" for an individual. A rational social system existed, with different established stages and goals, and everyone worked completely within his

boundaries. Each home was itself a community mental health center organized along traditional lines, and there were experts to deal with more severe problems. Mental illness was believed to result from defective human transactions, and treatment was directed toward active socialization in group activities or toward change of environment.—R. S. Albin.

32. Ratner, Stanley C.; Katz, Leo & Denny, M. Ray. (Michigan State U) **Training a surrogate for evaluation of tobacco smoking of humans: Rationale and outcome.** *Psychological Record*, 1974(Sum), Vol 24(3), 365-372.—Argues that problems of statistics, ethics, and convenience interfere with drawing strong conclusions about relations between smoking tobacco and other processes when humans are Ss in the investigations. The present study established and tested a research preparation and procedure to study smoking behavior with a half-grown male weeper capuchin monkey (*Cebus apella*). Long-term habituation procedures to the testing situation and to tobacco smoke were necessary. Smoking then occurred reliably, using a procedure to fade-in smoke with a reward contingency for smoking a preferred substance. After smoking was discontinued for several months, reliable smoking performance was reinstated by reinstating the testing conditions.—*Journal abstract*.

33. Rubin, Zick. (Harvard U) **A new order of things: A case study in the reconstruction of an experimental procedure.** *Representative Research in Social Psychology*, 1974(Jun), Vol 5(2), 81-87.—Presents a case study of the way in which the procedures of a psychological study may be reconstructed in subsequent accounts. The order of events of a well-known social-psychological experiment by E. Walster (see PA, Vol 39:15004) has been reversed—either directly or by implication—in subsequent accounts. The perceptual processes which may underlie such unintentional reconstructions are discussed. It is suggested that the sequence-reversal may be attributable in part to the assimilation of the actual procedure to psychologists' preconceived explanatory frameworks. The reconstruction of events may also be facilitated by the slippage which occurs when information about a study is transmitted from one source to another. Such reconstructions of research procedures are probably not confined to isolated cases nor indulged in only by social psychologists. Although they may illustrate theoretically interesting processes, they are also likely to bias scientific literature. (18 ref)—*Journal abstract*.

34. Sjöberg, Lennart. **On the homogeneity of psychological processes.** *Göteborg Psychological Reports*, 1973, Vol 3(15), 16 p.—Considers that a basic theme in psychological thinking is that of process. Overt behavioral variables are often seen as indicants of psychological processes. The problems arising in generalization from such indicants and from their interpretation across different populations, persons, and situations are discussed. Methods for measuring homogeneity of processes are outlined, and the relationship between similarity and correlation is emphasized as an important type of evidence as to homogeneity. Applications in the fields of attitude change and factorial studies of human intellect are briefly discussed. (34 ref)—*Journal abstract*.

35. Skinner, B. F. (Harvard U) **About behaviorism.** New York, NY: Alfred A. Knopf, 1974. 256 p. \$6.95.—Presents Skinner's explanation of the theories propounded in his book *Beyond Freedom and Dignity* defining, analyzing, and defending his highly controversial views on behaviorism. Among the topics discussed are the causes of behavior; innate, operant, and verbal behavior; thinking and knowing; and emotion and the sense of self.

36. Smith, Noel W. (State University Coll New York, Plattsburgh) **The ancient background to Greek psychology and some implications for today.** *Psychological Record*, 1974(Sum), Vol 24(3), 309-324.—Examines the belief system and psychological concepts of primitives and peoples of ancient civilizations together with the influences of the latter on the Greeks, showing the continuity in naturalistic modes of thought that led to the development of Greek scientific psychology. The psychologies of today that have incorporated dualism and reverted to animism are rooted in this post-Greek supernaturalism. The approach of the Greeks and their predecessors may offer insights toward overcoming contemporary conceptual impediments. (44 ref)

37. Taplin, Paul S. & Reid, John B. (Oregon Research Inst, Eugene) **Effects of instructional set and experimenter influence on observer reliability.** *Child Development*, 1973(Sep), Vol 44(3), 547-554.—Conducted a laboratory analog of naturalistic observation to examine the relationship of observer drift to instructional set and experimenter status. 3 instructional sets (no check, random check, and spot check) and 2 levels of experimenter status were studied with 18 female undergraduates serving as Os. Os were trained to use a behavior coding system to rate a videotape of mother-child interaction. Results indicate a highly significant decrease in O reliability coinciding with the shift from training to data collection. This performance decrement was observed in all 3 instructional set conditions. Within the spot-check condition, reliability on spot-check days was significantly greater than mean reliability immediately before and after spot checks. Further results reveal that Os trained by the high-status E performed less reliably than Os trained by the other 2 Es. Implications for future observational research and suggestions for minimizing observer drift are discussed. (21 ref)—*Journal abstract*.

38. Thompson, Elton N. (California State Coll., San Bernardino) **A plea for replication.** *California Journal of Educational Research*, 1974(Mar), Vol. 25(2), 79-86.—Argues that replication of research studies is a worthwhile activity for the beginning researcher, emphasizing the increased mentions of replications in textbooks dealing with research methodology. The author's own replication of an earlier study on factors affecting problem-solving in elementary school mathematics courses is presented to demonstrate that replications can be very instructive and not mere copywork. Findings which are repeatedly supported through subsequent replications of the original investigation can be used with greater confidence than results of only 1 study "significant at the .001 level." The search for reasons why findings from replications differ can also provide a

valuable learning experience for the investigator. (17 ref)  
—*Journal abstract.*

39. U Göteborg, Dept of Psychology . (Sweden)  
**Annual report: University of Göteborg Psychological Reports.** Göteborg Psychological Reports, 1973, Vol 3(16), 22 p.—Presents summaries of the work carried out by the Department of Psychology, including research in the fields of applied general psychology, psychobiology, and psychological gerontology. Among the works outlined are those in industrial and child psychology, psycholinguistics, psychometrics, and sexual behavior.

40. Wollheim, Richard (Ed.). (University Coll London, England) **Freud: A collection of critical essays.** New York, NY: Doubleday, 1974. xv, 416 p. \$4.95.—Presents 22 readings which interpret Freud's thought from the viewpoint of philosophy. Among the topics discussed are dream interpretation, emotions, the id and the thinking process, rational behavior and psychoanalytic explanation, and the psychology of language. (8 p ref)

## PSYCHOMETRICS AND STATISTICS

41. Campbell, David P.; Crichton, Leslie; Hansen, Jo L. & Webber, Patricia . (Ctr for Creative Leadership, Greensboro, NC) **A new edition of the SVIB: The Strong-Campbell Interest Inventory.** *Measurement & Evaluation in Guidance*, 1974(Jul), Vol 7(2), 92-95.—Made several changes in a new edition of the Strong Vocational Interest Blank to reflect more accurately the changing occupational roles of the sexes. 1 booklet and 1 profile form are used for both sexes, and profile scores are organized into J. L. Holland's theoretical system. All testing and interpretive materials have been screened to eliminate subtle sexism.

42. Fisher, Mary A. (U. Maryland, Baltimore County) **Estimating hypothesis strengths.** *Behavior Research Methods & Instrumentation*, 1974(May), Vol. 6(3), 309-311.—Demonstrates that violation of the exhaustiveness postulate of M. Levine's (1965) hypothesis model produces large errors in the estimation of the proportions of problems mediated by the various hypotheses. In 2 cases, when stat-subject simulations satisfied the postulates, estimates were reasonably close to actual values. One interpretation proposes that negative values of estimates are an indication that the exhaustiveness assumption is violated. An alternative computational method is described.—*Journal abstract.*

43. Harris, David R. & Fenker, Richard . (Texas Christian U) **INDSCAL for a small computer using basic FORTRAN IV.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 129-132.—INDSCAL is a computer program for testing individual differences in multidimensional scaling. The model underlying the procedure assumes that individuals weight differently the several dimensions of a common psychological space and that these weights, as well as stimulus projections on the common axis, can be determined as part of the scaling solution. A discussion of input and output specifications, and of the capabilities, limitations, and availability of the program is provided.—*R. W. Covert.*

44. Koehler, Roger A. (U Nebraska, Teachers Coll) **Overconfidence on probabilistic tests.** *Journal of Educa-*

*tional Measurement*, 1974(Sum), Vol 11(2), 101-108.—Evaluated a potentially useful measure of overconfidence on confidence response multiple-choice tests. The measure of overconfidence is based on probabilistic responses to 7 nonsense items embedded in a 33-item vocabulary test. The test was administered under both confidence response and conventional choice response directions to 208 undergraduate educational psychology students. Measures of vocabulary knowledge based on confidence and choice responses, overconfidence, and risk-taking propensity were obtained. Overconfidence was significantly related in a negative direction to confidence response vocabulary scores and essentially unrelated to choice response vocabulary scores. A moderate correlation was found between overconfidence and risk-taking propensity; however, the scatter plot for these measures showed that this relationship may have been spurious. (15 ref)—*Journal abstract.*

45. McPherson, J. Miller & Huang, Cliff J. (U Nebraska) **Hypothesis testing in path models.** *Social Science Research*, 1974(Jun), Vol 3(2), 127-139.—Demonstrates that the 3 prior criteria for linear recursive causal (path) model evaluation are equivalent to a more general technique. Hotelling's  $T^2$  is introduced as a means of evaluating general hypotheses for the entire model, and the "twice standard error" rule is shown to be misleading. (26 ref)

46. Nowakowska, Maria . (Polish Academy of Sciences, Inst of Praxiology, Warsaw, Poland) **Polish adaptation of the Sixteen Personality Factor Questionnaire (16 PF) of R. B. Cattell, as a source of cross-cultural comparisons.** *Polish Psychological Bulletin*, 1974, Vol 5(1), 25-33.

47. Nyborg, Helmuth & Isaksen, Bo . (U Aarhus, Inst of Psychology, Risskov, Denmark) **A method for analysing performance in the rod-and-frame test: II.** *Scandinavian Journal of Psychology*, 1974, Vol 15(2), 124-126.—Cites the new method of scoring the rod-and-frame test which was proposed by H. Nyborg (see PA, Vol 53:Issue 1). The statistical model behind the new method is introduced, and results of 2 experiments which tested the model with a total of 74 undergraduates are presented.—*Journal abstract.*

48. Nyborg, Helmuth . (U Aarhus, Inst of Psychology, Risskov, Denmark) **A method for analysing performance in the rod-and-frame test: I.** *Scandinavian Journal of Psychology*, 1974, Vol 15(2), 119-123.—Argues that scoring only the unsigned (absolute) errors in the rod-and-frame test (RFT) confounds a number of variables. Another way of scoring the RFT is proposed which differentiates between (a) the S's constant error, (b) the effect of the tilted frame, and (c) the rod starting position effect. The method also allows estimation of the response consistency of the S. The values for each S of the constant error, of the frame tilt effect, and of the rod starting position effect may be tested for significance on the basis of the degree of response consistency observed for that particular S, thus making the new method more person-oriented than the unsigned error method. Results from 3 experiments with a total of 54 university students are presented in support of the proposed method.—*Journal abstract.*

49. Rice, James A. (U Houston) **The psychodiagnostic profile.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 193-203.—Describes a psychodiagnostic profile form which is designed to do explicitly what most psychometricians and diagnosticians do implicitly—compare the results of a battery of tests for a single individual. The profile adjusts graphically the scaled scores of the more widely used psychoeducational instruments, provides for making similar transformations with other tests, and facilitates a readout of percentile ranks. Several case examples are presented.—*Journal abstract.*

50. Skvoretz, J.; Windell, P. & Fararo, T. J. (U Pittsburgh) **Luce's axiom and occupational prestige: Test of a measurement model.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 147-162.—Uses R. D. Luce's (1959) individual choice theory to provide a ratio-level measurement basis for an important sociological variable, occupational prestige. It is shown that earlier measurement procedures to scale this sociological variable are essentially arbitrary, although heuristically useful. Luce's axiom of choice and his ranking postulate were tested on choice sets of occupations where male undergraduate Ss pair-compared or ranked the occupations on the basis of their prestige. The axiom received qualified support, while the ranking postulate was not supported. It is concluded that Luce's choice theory can provide a ratio-level measurement basis for occupational prestige, although a procedure using rankings must be appropriately structured in order to be an adequate instrument of measurement. (27 ref)—*Journal abstract.*

### Test Construction & Validation

51. Baird, John S. (Bloomsburg State Coll) **An updated Rokeach Opinionation Scale.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1321-1322.—10 outdated items from Rokeach's Opinionation Scale were revised and presented with the 30 other items to 122 15-56 yr old males. Reliability and validity correlation coefficients suggest the updating of the instrument is useful.

52. Baumann, U. & Dittrich, A. (U Zurich, Psychiatric Clinic, Switzerland) **[Examination of the German version of a semantic differential designed for assessing emotional states.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1972, Vol 4(1), 335-350.—Administered the German version of H. Heimann's semantic differential to 261 German students (181 boys and 90 girls), and compared the German version with the original French version. Results were factor analyzed by several methods, and the obtained scales were analyzed according to the criteria of the classical theory of tests. The factorial structure of the French version was not confirmed by factor analysis. 3 of the 4 original scales showed relatively high intercorrelations. The 4 original scales satisfied the criteria of the classical theory of tests (clarity, separation, and distribution). (English summary)—*T. Fisher.*

53. Boldt, R. F. (Educational Testing Service, Princeton, NJ) **An approximately reproducing scoring scheme that aligns random response and omission.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 57-61.—One formulation of confidence scoring

requires the examinee to indicate as a number his personal probability of the correctness of each alternative in a multiple-choice test. For this formulation, a linear transformation of the logarithm of the personal probability of the correct response is maximized if the examinee reports accurately his personal probability. To equate the score assigned to omitted items with the score assigned to chance scores, the transformation can be chosen so that the score is zero if the examinee indicates complete uncertainty. If this is done, the scoring function depends on the number of alternatives. One could also align uncertainty and response omission by granting credit for omitting items, though it is felt this might be hard to explain to examinees.—*Journal abstract.*

54. Brandenburg, Dale C. & Forsyth, Robert A. (U Illinois) **Approximating standardized achievement test norms with a theoretical model.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 3-9.—Attempted to answer the question, can standardized achievement test norms be better estimated with a theoretical probability model other than the negative hypergeometric model? 90 norms distributions from 2 standardized achievement test batteries (Iowa Tests of Basic Skills and Iowa Tests of Educational Development) were fitted by 6 models. Results strongly supported the Pearson Type I model (4 moments) as the best-fitting curve. It is concluded that this Type I model could provide a viable alternative to the negative hypergeometric model for use in approximating distributions when moment estimates are obtained from multiple matrix sampling or item sampling procedures.—*Journal abstract.*

55. Carver, Ronald P. (American Inst for Research, Washington, DC) **Two dimensions of tests: Psychometric and edumetric.** *American Psychologist*, 1974(Jul), Vol 29(7), 512-518.—Notes that because of design and development techniques, most tests focus upon either between-individual differences or within-individual gain. These 2 primary dimensions of tests have been called psychometric and edumetric. The psychometric dimension has been focused upon traditionally, so that most of the standardized tests being used to measure gain or growth have not been developed or evaluated from an edumetric standpoint. The danger inherent in this practice is that a treatment effect may appear to be small or insignificant simply because the test was designed to be sensitive to individual differences rather than gain. The differences between psychometric and edumetric dimensions on the Sequential Tests of Educational Progress (Reading) are compared with respect to the purpose of the test, item selection, reliability, validity, and interpretation of scores. (15 ref)—*Author abstract.*

56. Evans, Richard M. & Misfeldt, Kathy. (Morning-side Coll) **Effect of self-scoring procedures on test reliability.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1248.—Describes the use of invisible ink answer sheets which allowed instant feedback on multiple-choice examination questions and enabled examinees to continue trying until a correct choice had been made, with self-scoring on a 3-2-1-0 point basis for a 4-choice question. On 3 tests this procedure produced greater split-half reliability estimates than the same

examination scored by the conventional right-wrong method.

57. Ferguson, Leonard W. (Ohio U) **Spearman-Brown reliability coefficients for Ferguson's 80-item pair-comparisons person-perception scale.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1161-1162.—Reports that with 1 possible exception, there is no relation between experimental condition (warm or cold set, interviewer or interviewee role) and reliability of person-perception score in the Sager-Ferguson person-perception studies which reported a personality assessment based on a warm-cold dimension.

58. Haladyna, Thomas M. (Southern Illinois U) **Effects of different samples on item and test characteristics of criterion-referenced tests.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 93-99.—Explores the possibility that classical procedures are both applicable and appropriate when samples of both mastery and nonmastery examinees are employed. A rationale for using these samples is given, and empirical evidence is presented which supports the practice of combining samples to increase the variance of test scores and thereby permit the proper estimate of reliability and item validities. It is concluded that, from a pedagogical viewpoint, the criterion-referenced (CR) discrimination index may be more conceptually satisfying when communicating the meaning of CR item discrimination; but the combined samples point biserial discrimination index appears to be the most efficient method for obtaining information about the adequacy of the CR test items.—*Journal abstract*.

59. Hebel, Richard . (U Maryland, Medical School, Baltimore) **The number of questions needed for discriminatory power on multiple choice examinations.** *Journal of Medical Education*, 1974(Aug), Vol 49(8), 787-789.—Presents a method of determining sensitivity (i.e., the probability of identifying students with deficient knowledge of the subject matter) and specificity (i.e., the probability that those students who have an acceptable minimum of knowledge will pass the examination) of multiple-choice tests at given passing marks.

60. Lushene, Robert E.; O'Neil, Harold F. & Dunn, Thomas . (VA Hosp, Bay Pines, FL) **Equivalent validity of a completely computerized MMPI.** *Journal of Personality Assessment*, 1974(Aug), Vol 38(4), 353-361.—Within the context of a counterbalanced design, 63 female undergraduates were tested with a computerized Minnesota Multiphasic Personality Inventory (MMPI) and a group booklet mode of administration. The State-Trait Anxiety Inventory was administered before and after each testing session. The computerbased MMPI scale scores correlated as high or higher with the booklet administration scores than correlations reported for comparisons between booklet and card form administrations or booklet-booklet administrations for a college population. When compared to the booklet version, the computer mode initially produced relatively high state anxiety levels. By the end of the test, however, no difference in state anxiety levels between the 2 modes of administration was found. (16 ref)—*Journal abstract*.

61. McGary, Barbara A. & Burns, John A. (Northwestern U) **ATSCALE: An evaluation of unidimensionality and internal consistency of responses to a series of**

**questions.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 177-178.—Describes a program which allows the researcher to test the single-factoredness of a scale as well as its internal consistency. The program computes Guttman's coefficient of reproducibility, chance expectancies of scale types, Green Index of Consistency, Loeringer Index of homogeneity, and other figures. A description of the program's use, limitation, and availability is provided.

62. Millman, Jason & Popham, W. James . (Cornell U) **The issue of item and test variance for criterion-referenced tests: A clarification.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 137-138.—Criticizes M. I. Woodson's paper, contending that the population of observations originally prescribed for criterion-referenced tests is a domain of items and the responses of a single individual to them. Thus, item or score variability is an unnecessary characteristic of criterion-referenced tests as they have been traditionally conceived, i.e., as measures of well-defined classes of examinee behaviors. The defining character of criterion-referenced tests is destroyed when the construction and selection of criterion-referenced test items are tampered with to maximize the test's validity to discriminate between groups, which is the case when variability is required.—*Journal summary*.

63. Ray, John J. (U New South Wales, Kensington, Australia) **Projective tests can be made reliable: Measuring need for achievement.** *Journal of Personality Assessment*, 1974(Aug), Vol 38(4), 303-307.—Suggests that with self-rating (or "Likert") scales, reliability is partly a function of number of items. It is therefore suggested that increasing the number of measurements (items) should also improve projective test reliabilities. Empirical examples of need achievement measurement are presented to support this contention. Evidence is also mentioned which suggests that reliability can further be improved by different scoring systems and stimulus materials. (20 ref)—*Journal abstract*.

64. Sixtl, Friedrich. (Coll. of Social & Economic Sciences, Linz, Austria) **[Statistical foundation for a fully automated examiner.]** (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol. 6(1), 28-38.—Presents 2 kinds of objective attainment tests. One has a fixed number of items for examination in groups. The alpha error can be regulated by the number of items, while the beta error depends on the attainment parameter of the examinee. The other is a sequential test (i.e., the number of items becomes a random variable) so that the beta error can also be regulated. The sequential attainment test can be governed by computer.—*English summary*.

65. Valecha, Gopal K. & Ostrom, Thomas M. (Indian Inst of Management, Bangalore) **An abbreviated measure of internal-external locus of control.** *Journal of Personality Assessment*, 1974(Aug), Vol 38(4), 369-376.—Administered an abbreviated version of Rotter's Internal-External Control Scale (developed by eliminating all filler items and excluding items whose content themes were neither work related nor global in their referents) to a national probability sample of 4,330 16-26 yr old males. Psychometric properties (distributional characteristics, scale reliability, and item-test correla-

tions) of the abbreviated scale were similar to the full 29-item scale. Comparable factor structures were obtained for both black and white Ss. Blacks gave more external responses than whites.—*Journal abstract.*

66. Washington, William N. & Godfrey, R. Richard. (Lackland Air Force Base, Career Evaluation Branch, TX) **The effectiveness of illustrated items.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 121-124.—Examined 2 problems in test development which relate to the use of illustrations: (a) Do illustrated items perform better than written items, and (b) Does item performance vary as a function of the type and size of the illustration? A sample of 63 tests was drawn from all the Air Force Specialty Knowledge Tests containing illustrations. These 63 tests were previously administered to approximately 28,261 airmen under operational conditions. Item statistics between illustrated and written items drawn from the same content areas were compared, using *F* ratios. Illustrated items in general performed slightly better than matched written items. The best-performing illustrated items were tables.—*Journal abstract.*

67. Woodson, M. L. (U California, Inst of Human Learning, Berkeley) **The issue of item and test variance for criterion-referenced tests: A reply.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 139-140.—Replies to criticisms by J. Millman and W. J. Popham (see PA, 53:Issue 1), asserting that it is necessary for items and tests to have variance and discrimination in the range of interest (population of observations) for which they are calibrated and selected. The basis for selection of the calibration sample determines the kind of scale which will be developed. A random sample from a population of individuals leads to a norm-referenced scale, and a sample representative of abilities of a range of characteristics leads to a criterion-referenced scale. The essential problem is that the items be calibrated (and selected) for the type of scale for which they will be used.—*Journal abstract.*

### Mathematical Models & Statistics

68. Aiken, Lewis R. (Guilford Coll) **Procedures for computing scores and correlations on ordered multicategory test items.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 173-176.—Provides a group of procedures for scoring rearrangement tests, and discusses a computer program based on these procedures.

69. Anderson, R. Bruce. (U Texas, Arlington) **A Markov chains model of medical specialty choice.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 259-274.—Employed data from 118 male members of 3 consecutive cohorts of students at a private Southern medical school to develop a discrete-parameter, stationary Markov chains model of the medical specialty choice process. This model was then tested on independent subsamples from the same population, generating a series of predicted specialty choices which did not differ from observed choices by more than chance expectations. Results demonstrate the utility of a simple Markovian model of a choice process. (15 ref)—*Journal abstract.*

70. Barcikowski, Robert S. (Ohio U) **Selecting optimum sample size and number of levels in nested random-effects designs.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 141-144.—Describes a computer program which allows the researcher to select the optimum sample size in nested random-effects designs, given an appropriate level of significance, total sample size, estimate of the population effects, and the effects it is desired to detect. A description of the program and a discussion of its limitations and availability are provided.—*R. W. Covert.*

71. Berry, Kenneth J.; Martin, Thomas W. & Olson, Keith F. (Colorado State U) **A note on fourfold point correlation.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 53-56.—Presents formulas for a modification of Pearson's 4-fold point correlation possessing always-attainable limits of  $+/-1$  and intermediate values operationally interpretable in terms of proportionate reduction in error of estimation.

72. Bolding, James T. & Houston, Samuel R. (U Arkansas) **A FORTRAN computer program for computation of ridge regression coefficients.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 151-152.—Presents a computer program to compute ridge regression. Ridge regression is discussed. A description of the program's use, limitations, and availability is provided.

73. Brown, David L. (U Connecticut) **Computerized rules of thumb for factorial analysis of variance tables.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 145-146.—Presents a computer program to determine the correct formulas for entries in analysis of variance tables. A discussion of the program's use and availability is included.

74. Caldwell, Michel. (U Mississippi) **Within-cell vs over-all correlations in the analysis of factor variance.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1191-1201.—Discusses the advantage of using B. J. Winer's (1962) within-cell correlations in the analysis of factor variance, as well as the conservative bias that theoretically exists in such a procedure. A Monte Carlo study is also described which examined the extent of this bias for 1st, 2nd and 3rd component ratios. Suggestions for dealing with or avoiding the problem of the bias are outlined. (15 ref)—*Journal abstract.*

75. Church, Marjorie; Koslowsky, Meni & Bailit, Howard. (U Connecticut) **A program for determining profile similarity for purposes of classification.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 155-157.—Presents a computer program which compares the profile of an individual with some referent group profile. A chi-square value is calculated as a measure of similarity. A discussion of the program's use, limitation, and availability is provided.

76. Clopton, James R. (VA Hosp, Topeka, KS) **A computer program for MMPI scale development with contrasted groups.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 161-163.—Presents a computer program which tests the differences, using either a chi-square test or the Fisher exact probability test, between comparison and criterion groups. A description of the program's use, limitations, and availability is provided.

77. Conger, Anthony J. (Duke U) **A revised definition for suppressor variables: A guide to their identification and interpretation.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 35-46.

—Shows that in the 2-predictor situation traditional and negative suppressors increase the predictive value of a standard predictor beyond that suggested by the predictor's zero order validity. This effect of suppression is used to provide a revised definition of suppression and completely accounts for traditional and negative suppression. The revised definition, in conjunction with a 2-factor model, is shown to lead to a previously undetected type of suppression (reciprocal suppression) which occurs when predictors with positive zero order validities are negatively correlated with one another. In terms of the definition and parameters of the model, limits are determined in which the types of suppression can occur. It is shown how suppressors can be identified in multiple regression equations and a procedure is given for interpreting whether the variables are contributing directly (by predicting relevant variance in the criterion), or indirectly (by removing irrelevant variance in another predictor), or both.—*Journal abstract*.

78. Cowles, M. P. (York U, Atkinson Coll, Toronto, Ontario, Canada)  **$N = 35$ : A rule of thumb for psychological researchers.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1135-1138.—Discusses 4 aspects of statistical tests—alpha level, strength of relationship, power, and sample size—which must be considered in assessing outcomes. Since specifying any 3 of these parameters determines the 4th and since an alpha level of .05, a strength of relationship equivalent to 10% shared variance, and a power of .50 for common statistical tests are generally-used conventions, the use of  $N = 35$  is suggested as a convenient and economical rule of thumb.—*L. Gorsey*.

79. Cramer, Elliott M. (U North Carolina) **On Browne's solution for oblique Procrustes rotation.** *Psychometrika*, 1974(Jun), Vol 39(2), 159-163.—Discusses M. W. Browne's (see PA, Vol 41:11151) solution to the problem of finding a least squares fit to a specified factor structure. Browne's solution involves eigenvectors and values which lead to an iterative solution. A form of the solution which does not involve solution of an eigenvalue problem but which does require an iteration similar to Browne's is presented. The possible existence of a singularity is suggested, and a simple modification of Browne's computational procedure is proposed which deals with this case. A better starting value for the iteration is also proposed for which convergence is guaranteed using the ordinary Newton iteration.—*Journal abstract*.

80. Doreian, Patrick. (U Pittsburgh) **On the connectivity of social networks.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 245-258.—Presents binary matrix operations for valued graphs in the context of analyzing social structures through the use of graph theory. These operations are demonstrated in the analysis of social network data presented by B. Kapferer (1969). (15 ref)—*Journal abstract*.

81. Everitt, Brian. (Inst of Psychiatry, U London, England) **Cluster analysis.** New York, NY: John Wiley & Sons, 1974. 122 p.—Reviews the literature concerning

cluster-analysis techniques, discusses problems encountered in their application, presents an empirical investigation of some methods of cluster analysis, and details procedures for use with clustering techniques. (11 p ref)

82. Frederiksen, Carl H. (U California, Berkeley) **Models for the analysis of alternative sources of growth in correlated stochastic variables.** *Psychometrika*, 1974(Jun), Vol 39(2), 223-245.—Presents an approach to the analysis of multivariate time series in which linear structural relationships among multiple stochastic variables are investigated. A number of alternative symmetric and asymmetric structural models are considered for the case of 2 stochastic variables. Each model represents a possible hypothesis concerning the relationship of growth in 1 variable to growth in the 2nd. Extensions of 2 of the models to 3 variables are illustrated with a numerical example, and the problem of detecting change in multivariate time series is discussed. (15 ref)—*Journal abstract*.

83. Garlock, Jerry C. (El Camino Coll, CA) **A short multiple correlation program for predicting one dependent variable from six predictive variables.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 153.—Describes a short computer program to calculate all the possible multiple correlations using 6 predictive variables to predict a dependent variable.

84. Goodman, Leo A. & Kruskal, William. (U Chicago) **Empirical evaluation of formal theory.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 187-196.—Criticizes the index of D. K. Hildebrand et al (see PA, Vol 53:Issue 1) which measures the adequacy of a theory that asserts or predicts emptiness of some cells in a 2-way cross-classification. Some proposed major defects of this index (e.g., its connection with the notion of statistical independence and the parochialism and simplism of its motivation) are cited.

85. Goodman, Leo A. & Kruskal, William. (U Chicago) **More about empirical evaluation of formal theory.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 211-213.—Continues the authors' criticism of the paradigm of Hildebrand et al (see PA, Vol 53:Issue 1) for the evaluation of a class of propositions predicting specific relations between quantitative variables. It is argued that the prediction method is not appropriate in the theory-evaluation context.

86. Gordon, Robert A. & Gleser, Leon J. (Johns Hopkins U) **The estimation of the prevalence of delinquency: Two approaches and a correction of the literature.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 275-291.—Proposes that the index "the proportion of a cohort that have become delinquent by a given age," here called the prevalence of delinquency, is an important social indicator. Methods by which this index can be estimated from data are indicated, and errors in previous sex- and race-specific prevalence estimates published by T. P. Monahan (1960) for the city of Philadelphia are corrected. The differences between the sexes and between the races shown by these corrected prevalence estimates are of sufficient magnitude to render suspect any comparisons of prevalences of delinquency among cohorts which do not take account of the sex and race compositions of the cohorts to be compared.—*Journal abstract*.

87. Gray, Louis N. & von Broembsen, Maximilian H. (Washington State U) **On simple stochastic diffusion models.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 231-244.—Expands G. Funkhouser and M. McComb's information models (1972) to include situations involving simple interaction processes and more complicated situations involving both mass-mediated messages and interactively-mediated messages. Discrete time models of information diffusion are developed. (19 ref)
88. Gross, Alan L.; Costa, Norman D. & Steckler, Jane F. (City U New York) **A FORTRAN program for hypothesis testing in the general linear model.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 133-135.—Describes a program which allows the researcher to test a wide class of statistical hypotheses in terms of the full rank regression model. A brief description of the model is provided along with a description of its use, limitations, and availability.
89. Guilford, J. P. (U Southern California) **Rotation problems in factor analysis.** *Psychological Bulletin*, 1974(Aug), Vol 81(8), 498-501.—Replies to criticisms by J. L. Horn and J. R. Knapp (see PA, Vol 51:1085) regarding the methods of factor-analytic rotations that were used in deriving the empirical basis for development of the structure-of-intellect model and for testing its validity. Their arguments were not convincing because (a) they selected 3 biased cases out of more than 30 for their illustration, (b) the gaps between hits and errors in rotating to random hypotheses vs structure-of-intellect hypotheses were quite large, and (c) they failed to extend their test to include aims at invariance in terms of fit to a general theory. (15 ref)—*Journal abstract*.
90. Harris, David R. & Woodward, J. Arthur. (Texas Christian U) **Kaiser's Little Jiffy, Mark IV for a small computer using basic FORTRAN IV.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 119-120.—Presents a computer program to do exploratory factor analysis, using the Little Jiffy Mark IV method. A description of the program's limitations and availability is provided.
91. Havlicek, Larry L. & Peterson, Nancy L. (U Kansas) **Robustness of the *t* test: A guide for researchers on effect of violations of assumptions.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1095-1114.—Attempted to determine empirically the effects of quantified violations of assumptions underlying the *t* test. Using computer simulations, the effects of heterogeneity of variance, non-normality, and nonlinear transformations of scales were studied separately and in all combinations. Monte Carlo procedures were used to generate populations of scores for which distributions were normal, positively skewed, negatively skewed, and leptokurtic. Samples of varying sizes were then randomly selected from specific populations and *t* tests were run to identify where discrepancies between obtained and expected *t* distributions would occur. Results indicate that certain violations or combinations produced little distortion in resulting *t* distributions, while other violations produced significant discrepancies. Specific guidelines and reference tables, developed to assist the researcher in assessing the severity of certain violations or degrees of violation, are presented. (27 ref)—*Journal abstract*.
92. Henschke, C. I. & Chen, M. M. (Georgetown U) **Variable selection technique for classification problems.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 11-18.—Illustrates the usefulness of a variable selection technique when the linear discriminant function is used to develop a classification rule. A stepwise technique is given together with an illustration of how the expected loss can be reduced using fewer variables.
93. Hildebrand, David K.; Laing, James D. & Rosenthal, Howard. (U Pennsylvania) **Prediction logic and quasi-independence in empirical evaluation of formal theory.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 197-209.—Refutes L. A. Goodman and W. Kruskal's (see PA, Vol 53:Issue 1) criticism of the authors' proposed paradigm for an interpretable model that yields a distinct measure of prediction success for each logically distinct, a priori scientific proposition stated in the prediction logic. It is argued that Goodman and Kruskal's alternative procedures based on quasi-independence are not viable solutions to the problem. (15 ref)
94. Hildebrand, David K.; Laing, James D. & Rosenthal, Howard L. (U Pennsylvania) **Prediction logic: A method for empirical evaluation of formal theory.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 163-185.—Proposes an approach to data analysis that assists the investigator in discriminating among specific relations corresponding to alternative scientific predictions about qualitative variates. (31 ref)
95. Horn, John L. & Knapp, John R. (U Denver) **Thirty wrongs do not make a right: Reply to Guilford.** *Psychological Bulletin*, 1974(Aug), Vol 81(8), 502-504.—Considers that J. P. Guilford's (see PA, Vol 53:Issue 1) reply to the authors' criticisms of his factor analysis of his structure-of-intellect model has failed to come to grips with evidence indicating that if the number of targeted variables for each factor is 3 or fewer, Procrustes factoring provides no better evidence for structure-of-intellect theory than for any of an infinity of other arbitrarily determined theories. Under these conditions factors can be rotated in such a way as to suggest support for almost any desired solution, and one such solution can be that labeled a replication. Hence the factorial invariance claimed under such conditions can indicate only consistency in the researcher and his methods, not in the phenomena studied. (16 ref)—*Journal abstract*.
96. Horrell, James F. & Lessig, V. Parker. (Washington State U, Coll of Economics & Business) **A note on a nonparametric test of independence between two vectors.** *Journal of Marketing Research*, 1974(Feb), Vol 11(1), 106-108.—Describes a nonparametric technique for examining the dependence structure between 2 multivariate sets of measurements. An application of the procedure to consumer attitudes is described, possible modifications of the technique for more than 2 tests of measurements are noted, and differences between this technique and canonical analysis are discussed.
97. Kaiser, Henry F. & Rice, John. (U California, Berkeley) **Little Jiffy, Mark IV.** *Educational & Psychologi-*

*cal Measurement*, 1974(Spr), Vol 34(1), 111-117.—Describes 3 changes and 1 new development for the 2nd generation Little Jiffy method of exploratory factor analysis. A computer algorithm based on the addition and revision is presented.

98. Kruskal, Joseph B. & Shepard, Roger N. **A nonmetric variety of linear factor analysis.** *Psychometrika*, 1974(Jun), Vol 39(2), 123-157.—Presents a model in which the numbers in each column of an  $n \times m$  matrix of multivariate data are interpreted as giving the measured values of all  $n$  of the objects studied on one of  $m$  different variables. The rank order of the numbers in such a column is determined by a linear rule of combination of latent quantities characterizing each row object with respect to a small number of underlying factors. An approximation to the linear structure assumed to underlie the ordinal properties of the data is obtained by iterative adjustment to minimize an index of overall departure from monotonicity. The method is nonmetric in that the obtained structure is invariant under monotone transformations of the data within each column. Tests show (a) that, when the assumed monotone relationships are strictly linear, the recovered structure closely approximates that obtained by standard (metric) factor analysis but (b) that, when these relationships are severely nonlinear, the nonmetric method avoids the inherent tendency of the metric method to yield additional, spurious factors. (34 ref)—*Journal abstract*.

99. Lewis-Beck, Michael S. (U Michigan) **Determining the importance of an independent variable: A path analytic solution.** *Social Science Research*, 1974(Jun), Vol 3(2), 95-107.—Suggests that the analysis of direct and indirect effects in a recursive causal model can provide a more satisfactory evaluation than the ordinary correlation and regression techniques commonly used in evaluating the importance of an independent variable. The interpretation of an independent variable's impact derived from a path model is generally more adequate, because it is able to take into account the operation of indirect effects and spuriousness. (18 ref)

100. Lienert, G. A. **[Configuration frequency analysis: IV. The association structure of clinical scales and symptoms.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1972, Vol 20(3), 231-248.—In Part 4 of a series of articles explaining the theory and methods of configuration frequency analysis, association structure analysis is presented as a technique to determine the complexity of the relations between binary variables by using the hierarchic version of the configuration frequency analysis. The method of finding configurational types is described and illustrated by graphs. Analysis of more specific and complex associations leads to a more differentiated examination and consideration of syndromes than would be possible by a correlation analysis of simple associations. 5 aphasia-specific test scales applied to the syndromes of 162 aphasics demonstrated the appearance of a higher order association between median-dichotomized scales in addition to first-order associations. (English summary)—*T. Fisher*.

101. Lingoes, James C. (U Michigan) **A FORTRAN IV program generalizing the Schönemann-Carroll matrix fitting algorithm to monotone and linear fitting of**

**configurations.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 121-124.—Presents a general computer program that allows the researcher to "test" the similarity of pairs of matrices, using both monotonic and linear fitting criteria. The procedure is based on a generalization of the Schönemann-Carroll Matrix Fitting Algorithm. The capacity and availability of the program are discussed.

102. Lord, Frederic M. (Educational Testing Service, Princeton, NJ) **Estimation of latent ability and item parameters when there are omitted responses.** *Psychometrika*, 1974(Jun), Vol 39(2), 247-264.—Considers that omitted items cannot properly be treated as wrong when estimating ability and item parameters. The item characteristic curve model is discussed, and a convenient method for utilizing the information provided by omissions is presented. Theoretical justifications and empirical data (using samples of 2,926, 994, and 2,946 examinees, respectively) are used for the estimates obtained by the new method. (18 ref)—*Journal abstract*.

103. Lutz, J. Gary. (Lehigh U, Div of Measurements & Research) **On the rejection of Hotelling's single sample T.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 19-23.—Multivariate hypotheses regarding the centroid of a single population can be tested using Hotelling's  $T^2$ . Upon rejection of such a hypothesis, there seems to be no available technique by which the relative contribution of each variable to the rejection can be gauged. An examination of the derivation of the  $T^2$  statistic, however, shows that while  $T^2$  is the only nonzero eigenvalue of the matrix, the elements of its associated eigenvector define the weighting scheme used in combining the original variables for the purposes of the test. When adjusted to provide dimensionless numbers, these elements reflect the relative contribution of each variable to the rejection of the original hypothesis.—*Journal abstract*.

104. MacCallum, Robert C. (Ohio State U) **Relations between factor analysis and multidimensional scaling.** *Psychological Bulletin*, 1974(Aug), Vol 81(8), 505-516.—Describes the fundamental relations between multidimensional scaling and factor analysis. Metric and nonmetric versions of both models are described in terms of type of data analyzed, assumptions made, objectives, computational procedures, geometric representations of data and solutions, and psychological meaning of results. What is commonly taken to be a fundamental identity between the metric versions of the 2 models is shown to be merely the employment of the same theorems. The strongest relations between the techniques lie in the realm of individual differences models for multidimensional scaling. Several such models are presented and are shown to represent the application of the logic of factor analysis to the substance of multidimensional scaling. (17 ref)—*Journal abstract*.

105. Martin, Warren S. (U. Georgia) **The effects of scaling on the correlation coefficient: A test of validity.** *Journal of Marketing Research*, 1973(Aug), Vol. 10(3), 316-318.—Studied the consequences of varying the number of scaling intervals on the validity of the correlation coefficient, using the formula for a bivariate normal distribution. Data show that the correlation coefficient decreased as the number of response categor-

ies grew smaller and suggest that the correlation coefficient may not be as robust as is generally assumed.

106. McCall, Robert B. & Appelbaum, Mark I. (Fels Research Inst, Yellow Springs, OH) **Bias in the analysis of repeated-measures designs: Some alternative approaches.** *Child Development*, 1973(Sep); Vol 44(3), 401-415.—Considers that the conventional analysis of variance applied to designs in which each S is measured repeatedly requires stringent assumptions regarding the variance-covariance (i.e., correlations among repeated measures) structure of the data. Violation of these assumptions results in too many rejections of the null hypothesis for the stated significance level. Several alternatives when heterogeneity of covariance exists, including nonparametric tests, randomization and matching procedures, Box and Greenhouse-Geisser corrections, and multivariate analysis, are described from an applied rather than theoretical standpoint. Multivariate techniques that make no covariance assumptions and provide exact probability statements represent the most versatile solution. (37 ref)—*Journal abstract*.

107. McDonald, R. P. (Ontario Inst for Studies in Education, Toronto, Canada) **Testing pattern hypotheses for covariance matrices.** *Psychometrika*, 1974(Jun), Vol 39(2), 189-201.—Presents an asymptotic likelihood-ratio test and maximum likelihood estimates of the free parameters for the hypothesis that 1 or more elements of a covariance matrix are zero, and/or that 2 or more of its elements are equal. The theory applies immediately to a transformation of the covariance matrix by a known nonsingular matrix. Estimation is by Newton's method, starting conveniently from a closed-form least-squares solution. Numerical illustrations include a test for equality of diagonal blocks of a covariance matrix, and estimation of quasisimplex structures.—*Journal abstract*.

108. McDonald, Roderick P. (Ontario Inst for Studies in Education, Toronto, Canada) **The measurement of factor indeterminacy.** *Psychometrika*, 1974(Jun), Vol 39(2), 203-222.—Argues that common factors must be thought of as unobservable and as uniquely defined but numerically indeterminate. It follows that L. Guttman's (1955) measure of indeterminacy is inconsistent with the foundations of the factor model in probability theory, and that the traditional measures of factor indeterminacy used by earlier writers should be reinstated. (21 ref)

109. Overall, John E. & Free, Spencer M. (U Texas, Medical Branch, Galveston) **Subset scaling (SUBSCL): Multidimensional scaling based on a subset of objects or variables.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 125-127.—Describes a program designed to accomplish multidimensional scaling of objects in terms of similarities on 1 set of measurements, and then to project into the resulting scale model a 2nd set of measurement vectors to provide meaning for directions in the reduced space. A description of the model is included along with input and output specifications.

110. Ramsey, Philip H.; Schmid, Bruce C. & Sorgie, Charles D. (Hofstra U) **A FORTRAN IV program for the Welch-Aspin solution of the Behrens-Fisher problem.** *Educational & Psychological Measurement*, 1974(Spr), Vol

34(1), 147-149.—Presents a program to calculate an unpooled error term and subsequently determined statistical significance in testing the difference between the means of 2 or more groups. A description of the program's use, limitations, and availability is provided.

111. Särndal, Carl E. (U British Columbia, Vancouver, Canada) **A comparative study of association measures.** *Psychometrika*, 1974(Jun), Vol 39(2), 165-187.—Discusses the general problem of measuring the association between an independent nominal-scaled variable  $X$  and a dependent variable  $Y$  whose scale of measurement may be interval, ordinal, or nominal. The theoretical foundations of a wide range of asymmetric association measures are discussed, and new measures are suggested. 15 of these association measures are singled out for a computer-assisted numerical study in which the value actually taken by each measure under a wide variety of conditions is computed. (28 ref)—*Journal abstract*.

112. Sheehan, Daniel S. & Hambleton, Ronald K. (U Massachusetts, Amherst) **A general FORTRAN IV test scoring program.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 169-171.—Presents a computer program which scores nearly all items of the single-response type. These include differential weighting schemes, selection of items to particular subscales, individual response patterns, correction for guessing, and formation of additional scores based on subscales. A description of the program's use, restrictions, and availability is provided.

113. Shine, Lester C. (U Dayton) **An extension of the Shine Combined Analysis of Variance.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 47-52.—Extends the basic ideas for the Shine Combined Analysis of Variance to the case where some factors do not have repeated measures. Schematic calculation procedures are presented for the 2-way case with repeated measures on 1 experimental factor. Some useful modifications of the basic Shine-Bower error term, which is used to test subject sources of variation, are presented.—*Journal abstract*.

114. Smith, Robert A.; James, Mark & Michael, William B. (U Southern California) **FORTRAN IV program to compute post hoc comparisons for multi-level chi square tests.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 159-160.—Presents a computer program which allows the researcher to test the difference between several response groups on various sets of items. A description of the program's use, limitation, and availability is provided.

115. Spence, Ian . (U Western Ontario, London, Canada) **On random rankings studies in nonmetric scaling.** *Psychometrika*, 1974(Jun), Vol 39(2), 267-268.—Disputes the conclusions of P. Arabie (1973) which suggest that the use of D. Klahr's and of H. H. Stenson and R. L. Knoll's (both 1969) results is not sensible. It is argued, however, that although there may be some justification for suspecting that a few of Klahr's and of Stenson and Knoll's values have been slightly inflated due to the presence of suboptimal solutions, there are reasons to believe that this is not the case in general. These reasons are briefly discussed, and F. Tschudi's

(1972) approach is suggested as a viable alternative.—*B. McLean.*

116. Werts, C. E.; Linn, R. L. & Jöreskog, K. G. **Intraclass reliability estimates: Testing structural assumptions.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 25-33.—Intraclass correlation reliability estimates are based on the assumption that the various measures are equivalent. A general model by Jöreskog for the analysis of covariance structures can be used to test the validity of this assumption.

117. Wike, Edward L. (U Kansas) **Some nonparametric multiple-comparison tests.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1055-1058.—Describes some nonparametric multiple-comparison tests for making both pairwise comparisons and a limited number of comparisons with  $k$  independent and  $k$  matched groups when the data consist of "bad" numbers and ranks or frequencies. The usefulness of T. A. Ryan's test for multiple comparisons of proportions and variances and the Dunn test of multiple comparisons using rank sums is noted.—*Journal abstract.*

## PERCEPTION AND MOTOR PERFORMANCE

118. Biersner, R. J.; Edwards, D. & Bailey, L. W. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **Effects of N<sub>2</sub> O on responses of divers to personality tests.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1091-1097.—Studied 30 20-50 yr old Navy divers in a repeated measures design to assess the effects on Hand Test performance of breathing N<sub>2</sub> O or air to approximately 210 ft below sea level. The number of interpersonal responses made while breathing N<sub>2</sub> O was initially high and remained stable. Concern about the environment decreased during N<sub>2</sub> O conditions. Response latency on N<sub>2</sub> O was significantly greater than that on air. Occupational implications are discussed. (20 ref)—*Journal abstract.*

119. Cohen, Malcolm M. **Changes in auditory localization following prismatic exposure under continuous and terminal visual feedback.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1202.—Because data from 16 right-handed male Ss show intermanual transfer of prism aftereffects was obtained with unseen auditory targets following exposure under terminal visual feedback, it is suggested that the transfer is not due to a change in the sensed position of the eyes, but rather to a change in the sensed position of the head relative to the trunk, since head position, and not eye position, subserves auditory localization.

120. Felfoldy, Gary L. (Yale U) **Repetition effects in choice reaction time to multidimensional stimuli.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 453-459.—4 paid adults classified as quickly as possible stimuli back-projected one at a time on a small screen by pressing 1 of 2 levers in response to stimuli—rectangles varying in height alone, in width alone, or in both dimensions, in either a correlated or an orthogonal fashion. Stimuli followed responses by a fixed interval of 82, 580, or 1,080 msec. Response time was longer when both dimensions varied orthogonally, indicating that Ss were unable to avoid perceiving the figures as wholes.

Repeated stimuli were responded to more quickly than stimuli which were different from the immediately preceding stimulus in all conditions. With orthogonally combined dimensions, response time to stimulus repetitions was lowest, increased when the stimulus changed while the response was repeated, and increased still further when both stimulus and response changed. Increasing the time interval between stimuli decreased response time for nonrepetitions, while response time for repetitions was relatively unaffected. Results are discussed in terms of 2 models of serial choice reaction time. (17 ref)—*Journal abstract.*

121. Green, David M. & Swets, John A. (U California, San Diego) **Signal detection theory and psychophysics.** Huntington, NY: Robert E. Krieger, 1974. xiii, 479 p.—Presents a reprint of the 1966 edition, containing introductions to probability theory, statistical decision theory, and waveform analysis and reviewing the basic experiments which support the application of detection theory to psychophysics and to a variety of substantive psychological problems. (11 p ref)

122. Harley, J. P.; Kalish, D. I. & Silverman, A. J. (U Wisconsin Hosp, Neuropsychology Lab, Madison) **Eye movements and sex differences in field articulation.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 615-622.—Examined the eye movements of 10 male and 10 female undergraduates during the rod-and-frame (RFT) and size-estimation tests. Males were significantly more field-independent than females on the RFT. No sex differences were observed on size-estimation, embedded-figures test, or in the number of vertical and horizontal eye movements recorded during the 2 tasks. Eye movements did not correlate with performance on either test. The latter finding questions the utilization of size-estimation to infer visual scanning. (27 ref)—*Journal abstract.*

123. Huddleston, Jo H. (Royal Aircraft Establishment, Human Factors Group, Farnborough, England) **Personality and apparent operator capacity.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1189-1190.—24 young adults performed a pursuit tracking task and were given the opportunity to accept a concurrent 2nd one as soon as they felt themselves capable of doing so. Personality tests (Eysenck Personality Inventory and Raven's Advanced Progressive Matrices) showed that the more anxious individuals delayed acceptance of this secondary task. No relationships were found between personality and tracking skill.

124. McCutcheon, Lynn E. (Catholic U of America) **Personality and speed of handwriting.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1154.—Administered the 16 Personality Factor Questionnaire (16 PF) to 63 undergraduates and obtained 2 measures of their handwriting speed. There were no significant correlations between handwriting speed and 16 PF scores ( $p < .01$ ).

125. Montgomery, Henry & Eisler, Hannes. (U Göteborg, Sweden) **Is an equal interval scale an equal discriminability scale?** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 441-448.—Used S. S. Stevens and E. H. Galanter's (see PA, Vol 33:2792) iterative procedure for minimizing bias in category scaling for the scaling of loudness of white noise, using 130 undergraduates.

ates as Ss. The spacing obtained deviated systematically from a spacing constructed in accordance with an equal discriminability scale from H. Eisler and H. Montgomery's (see PA, Vol 51:4100) study. For the stimulus spacing yielding a "pure" category scale, a magnitude scale was constructed. Since the category scale could be predicted accurately by Fechnerian integration of this magnitude scale, it is concluded that the pure category scale is a pure discrimination scale. The discrepancy between the equal discriminability scale and the pure category scale is interpreted as a bias in the former scale due to greater recognizability of stimuli located at the extremes of the stimulus range. (23 ref)—*Journal abstract*.

126. Ono, Horoshi & Angus, Robert G. (York U, Downsview, Ontario, Canada) **Adaptation to sensory-motor conflict produced by the visual direction of the hand specified from the cyclopean eye.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 1-9. —The experiment on which H. V. Helmholtz based his argument against R. Hering's principle of cyclopean projection was repeated with slight modification. The hypothesis tested was that the role of the cyclopean eye can be demonstrated by measuring sensorimotor adaptation. In 2 experiments with a total of 36 college students, each S aligned his finger to 1 of his eyes and a fixation stimulus on the median plane. In Exp I, results show a change of felt position toward the median plane. In Exp II, results show a shift of apparent visual straight ahead toward the location of the finger and a change in felt position. Results indicate that Helmholtz's argument is unjustified.—*Journal abstract*.

127. Peterson, John M. & Lansky, Leonard M. (U Cincinnati) **Left-handedness among architects: Some facts and speculation.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 547-550. —Conducted 2 studies of left-handedness among 487 male architecture students and 17 male architecture faculty members. Results show that (a) both groups tended to be more left-handed than would be normally expected; (b) all the left-handed students followed complex directions about drawing a spatial maze perfectly, whereas over 50% of right-handed students erred. Findings are discussed in relation to recent speculations about right-hemisphere dominance being associated with both left-handedness and greater spatial competence.—*Journal abstract*.

128. Radeau, Monique. (Free U Brussels, Lab of Experimental Psychology, Belgium) **[Differences in visual and auditory adaptation to prismatic displacement.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 23-33. —Studied adaptation after a pointing task where the target was defined simultaneously by a light whose true position was displaced 15% laterally by prisms, and by a nondisplaced sound. In 1 condition, the S was asked to point to the position of the target as indicated by the visual cues, in the other to its position as indicated by the auditory cues. After this task, eye-hand coordination shifted in the direction of adaptation to the prismatic deviation, and ear-hand coordination shifted in the opposite direction. The modality of the pointing task affected the size of the auditory aftereffect. An interpretation is proposed which combines the "cue-discrepancy" hypothesis and the nature of spatial information

needed for performance of the "exposure" task.—G. Rubin-Rabson.

129. Wilson, Roger V. (U Aircraft Establishment, Human Factors Group, Farnborough, England) **Display collimation under whole-body vibration.** *Human Factors*, 1974(Apr), Vol 16(2), 186-195. —Evaluated the presence and absence of a collimating lens over a display face at 2-, 4-, 6-, 8-, and 10-Hz whole-body vibration with a compensatory tracking task. The collimating lens significantly improved tracking performance of the 8 Ss at 4 and 6 Hz. Results are discussed in terms of body resonance phenomena and compensatory eye movements. (25 ref)

### Perceptual Processes

130. Adams, R. C. (California State U, Fresno) **Perceptual correlates of the Rod-and-Frame Test: A critical response.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1044-1046. —Critiques the use of factor analysis by G. Adevai et al (see PA, Vol 42:18160) in their bifactorial explanation of field independence-dependence. A more traditional and conservative use of the statistic supports the original definition and suggests mirror-tracing speed as an additional assessment tool.

131. Aitken, P. P. (U Strathclyde, Glasgow, Scotland) **Judgments of pleasingness and interestingness as functions of visual complexity.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 240-244. —30 17-50 yr olds ranked random polygons in terms of complexity, pleasingness, and interestingness. Group judgments of pleasingness and interestingness increased with complexity, with the former reaching an asymptote at a lower level than the latter. However, most of the individual pleasingness functions were unimodal—some decreased with complexity, some increased, and others increased to a peak and then decreased. Although most of the interestingness functions increased to peaks over the higher levels of complexity, Ss who judged the low-middle levels as most interesting tended to judge the higher levels as progressively less interesting. There was also a positive correlation between the levels of complexity found most pleasing and the levels found most interesting. Results are discussed with reference to theories of preference behavior proposed by W. N. Dember and R. W. Earl and by D. E. Berlyne. (19 ref) —*Journal abstract*.

132. Auerbach, Stephen M. (Virginia Commonwealth U) **Anxiety and time estimation: A failure to replicate Felix.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 187-196. —Used M. Felix's (see PA, Vol 40:4869) procedure to induce different levels of state-anxiety (A-State), and the A-State scale of the State-Trait Anxiety Inventory to measure actual degree of A-State arousal in 60 male undergraduates. Findings do not confirm Felix's assumption that Orienting Instructions would interact with Feedback Conditions to produce a specified continuum of arousal for his 6 experimental conditions. Felix's finding of a U-shaped relationship between conditions as he ordered them and time estimation was also not confirmed. No significant relationship was found between A-State and time estimates. Time estimation data suggest that perhaps time estimation is a function of individual constitutional or learning factors

and is relatively insensitive to immediate environmental fluctuations. (25 ref)—*Journal abstract*.

133. Bartol, Curt R. & Martin, Randall B. (Castleton State Coll) **Preference of complexity as a function of neuroticism, extraversion, and amplitude of orienting response.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1155-1160.—80 undergraduates scoring 1 standard deviation above and below the mean on the Neuroticism and Extraversion scales of the Eysenck Personality Inventory (EPI) were asked to rank order their preferences for 12 randomly generated polygons differing in complexity. Skin conductance response to a 7.5 watt orange light was used as a measure of S's orienting response. Extraverts preferred more complexity than introverts, and there was a trend for low orienters to prefer more complexity than high orienters. Neuroticism was not a significant factor.—*L. Gorsey*.

134. Bartoshuk, Linda M. (John B. Pierce Foundation Lab, New Haven, CT) **NaCl thresholds in man: Thresholds for water taste or NaCl taste?** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 310-325.—Notes that water is not tasteless to humans, but rather can produce any of the 4 basic taste qualities if it is preceded by adaptation to an appropriate substance. After adaptation to the NaCl in saliva, water tastes predominantly bitter. Results of detection threshold experiments with 9 male undergraduates and the author as Ss demonstrate that this bitter water taste can be confused with solute tastes so that some detection thresholds for NaCl may actually represent water thresholds instead. Water also appears to have a taste after adaptation to saliva in the rat. Just as with humans, some apparently low thresholds for NaCl detection in rat may be water-taste thresholds. The apparently high preference threshold for NaCl in rat may be a true NaCl threshold based on adaptation to saliva. (116 ref)—*Journal abstract*.

135. Berry, Gene A.; Prather, Dirk C. & Bermudez, John M. (US Air Force Academy) **Differential effects of verbal mediation on learning and transfer of a complex perceptual skill.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1239-1242.—Gave a range estimation task to 4 groups of 60 male undergraduates. One group learned the task by trial-and-error methods using performance feedback, and a 2nd group learned by trial-and-error but were required to verbalize their perceptions of target size. A 3rd group was given a strong prompt on training trials but no feedback, and a 4th group were given the prompt and required to verbalize their perceptions of target size. Verbalization caused a significant decrement in performance on transfer of the skill. The trial-and-error group's performance was significantly better than that of the other 3 groups.—*Journal abstract*.

136. Berthoud, Miriam & Morenza, Liliana. (U Paris V—René Descartes, Lab of Experimental & Comparative Psychology, France) **[Acquisition of the spatial concept and its use in two types of tasks: Reproduction and perceptive differentiation.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 67-78.—Compared the way in which children 4 and 5 yrs old reproduce the order in which several wooden dolls are arranged on a boat, and how they differentiate 2 boats carrying the same dolls

arranged in different order. These 2 performances develop together. Several reproductions were symmetrically organized. In the task of localization, perceptive analysis evolves genetically toward a multiplication and enlargement of references, together with their coordination.—*G. Rubin-Rabson*.

137. Bowd, Alan D. (U Manitoba, Winnipeg, Canada) **Factorial independence of perceptual egocentrism.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 453-454.—Factorial analysis of several measures of perceptual egocentrism and field dependence together with age, sex, socioeconomic status, and inductive reasoning indicated the comparative independence of perceptual egocentrism with regard to the other variables for 53 kindergarten children.—*Journal abstract*.

138. Chaves, John F. & Barber, Theodore X. (Medfield Foundation, MA) **Cognitive strategies, experimenter modeling, and expectation in the attenuation of pain.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 356-363.—Obtained verbal reports of pain from 120 female undergraduates during a base-level pretest and also during a posttest conducted under 1 of several experimental treatments. The pain stimulus was a heavy weight applied to a finger for 2 min. During the posttest, Ss who had been asked to utilize cognitive strategies for reducing pain (i.e., to imagine pleasant events or to imagine the finger as insensitive) showed a reduction in pain as compared to uninstructed control Ss. Ss led to expect a reduction in pain, but not provided with cognitive strategies, also showed reduced pain during the posttest compared to controls, but the reduction was smaller than for Ss using cognitive strategies. An E modeling procedure, used with half of the Ss under each experimental treatment, was effective in reducing verbal reports of pain only for Ss with high pretest levels who were asked to imagine pleasant events. (29 ref)—*Journal abstract*.

139. Clark, W. Crawford & Goodman, Janet S. (American Telephone & Telegraph Co, New York, NY) **Effects of suggestion on  $d'$  and  $C$ , for pain detection and pain tolerance.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 364-372.—Results of a study with 20 male and 20 female college students demonstrated that suggestion directed toward eliciting fewer reports of detection of minimal pain and suggestion directed toward greater pain tolerance (fewer withdrawals) altered the response probabilities in the expected direction and in addition raised both the pain detection and pain tolerance thresholds to thermal stimulation. However, sensory decision theory analysis of the same response data revealed that the sole effect of the suggestions was to raise the detection criterion for very faint pain and the withdrawal criterion for pain tolerance. Suggestion was absolutely without effect on the S's ability to discriminate noxious stimulation ( $d'$ ), indicating that suggestion had failed to produce an analgesic effect. Males set a higher criterion than females, but  $d'$  did not differ. It is concluded that many of the pain threshold changes produced by "cognitive control," hypnosis, counter-irritant stimulation, etc., are not due to decreased pain sensitivity but merely reflect changes in the criterion for reporting pain. (25 ref)—*Journal abstract*.

140. Davidson, Philip W.; Abbott, Sally & Gershenfeld, Jean . (U North Carolina, Chapel Hill) **Influence of exploration time on haptic and visual matching of complex shape.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 539-543.—2 experiments varied the time in which a total of 113 undergraduate Ss were allowed to explore stimuli during intra- and cross-model equivalence matching involving vision and touch. Increasing time to explore either each standard, each comparison, or both standard and comparison from 4 to 16 sec significantly improved haptic intramodel matching. However, cross-modal matching, from either vision to touch or touch to vision, improved significantly only when time to explore each standard was increased. Videotape recordings of Ss' hand movements revealed use of a greater variety of haptic scanning strategies by Ss in groups where increased exploration time enhanced accuracy. The difference in effects of exploration time on intra- compared to cross-model shape matching is discussed in terms of possible differences in requirements between the 2 tasks. (19 ref)—*Journal abstract*.
141. Devane, J. R. (State University Coll New York, Cortland) **Word characteristics and judged duration for two response sequences.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 525-526.—Followed up a previous study in which Ss read each of a series of 24 tachistoscopically presented words, wrote each down, and then judged the duration; judgments were apparently related to word length and word frequency. The present study employed 2 groups of 24 undergraduates each. Group Word-Time first wrote the word and then judged its duration, while Group Time-Word judged the duration first and then wrote the word. Word length did not significantly affect the judgments. Words of higher frequency produced significantly greater judgments of duration than did lower; however, the frequency effect was significantly larger for Group Word-Time than for Group Time-Word, indicating that judged duration occurred at least partly as a response to the act of writing the word.—*Journal abstract*.
142. Ehri, Linnea C. & Muzio, Irene M. (U California, Davis) **Cognitive style and reasoning about speed.** *Journal of Educational Psychology*, 1974(Aug), Vol 66(4), 569-571.—Administered a test for field dependence to undergraduates who were then asked to reason about the relative speeds of horses turning on a merry-go-round platform. Results reveal that unlike field-independent Ss who reasoned correctly from the outset, field-dependent Ss failed to think analytically.
143. Hayes, R. W. & Venables, P. H. (North East London Polytechnic, England) **Sex differences in undershoot with extended exposure time in the Rod-and-Frame Test.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 543-546.—Administered the rod-and-frame test (RFT) to 11 male and 11 female undergraduates. Increased exposure time gave a significant impairment in performance, as measured in absolute mean error ( $p < .001$ ), establishing that the exposure-time effect reported by the same authors in 26 female Ss also applies to males. When sign of error was taken into account, undershoot in the long exposure time condition was significantly greater than overshoot ( $p < .001$ ) and a significant interaction between sex and undershoot-overshoot was demonstrated ( $p < .05$ ). Use of long exposures may give a more sensitive measure of sex differences in premature reporting of upright in the RFT.—*Journal abstract*.
144. Honorton, C. ; Tierney, L. & Torres, D. (Maimonides Medical Ctr) **The role of mental imagery in psi-mediation.** *Journal of the American Society for Psychical Research*, 1974, Vol 68(4), 385-394.—Examined the function of mental imagery in mediating ESP information into consciousness in a clairvoyance card-guessing experiment involving 50 Ss. Each S completed 3 runs with instructions to respond to visual images of the target symbols and 3 runs with instructions to guess "the first thing that comes to mind." Ss were instructed to make confidence calls on trials they felt most likely to be correct. Individual differences in mental imagery were assessed by Sheehan's short form of the Betts Vividness of Imagery Scale. "Strong" imagers obtained consistent overall psi-hitting ( $p < .005$ ) and "weak" imagers obtained equally consistent overall psi-missing ( $p < .004$ ). The difference between "strong" and "weak" imagers was also significant ( $p < .004$ ). The difference between imagery and guessing conditions was not significant, suggesting that Ss employed consistent response strategies across conditions. Ss who were "strong" imagers obtained significantly more correct confidence calls than "weak" imagers ( $p < .05$ ). These findings support the hypothesis that internal cues to ESP targets are available and may be utilized to advantage in making psi responses.—*Journal abstract*.
145. Kreidler, Hans & Kreidler, Shulamith . (Tel-Aviv U, Israel) **Implications of ESP experiments for anthropological ESP research.** *Parapsychology Review*, 1974(May), Vol 5(3), 1-3.—Discusses perceptual experiments in which Ss were unknowingly influenced by a sender transmitting information extrasensorily. An effect was produced when extrasensory information was in contrast to that coming from normal channels and the sender actively tried to transmit his message instead of merely thinking about it. Information from ESP is viewed as a weak signal which is only detectable against a background of low input or noise from sensory channels, and in a situation which does not depend on guessing. It is suggested that anthropologists seeking to understand ESP should study cultures differing in their emphasis on cognitive functioning rather than those differing in relative primitiveness.—P. F. Grim.
146. Leon, Barry N. (Smith Coll) **Pain perception and extraversion.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 510.—Examined the relationships between extraversion and the initial perception of pain and between sex and the initial perception of pain, using a series of discrete electric shocks as the pain-inducing stimulus. Ss were 20 male and 20 female undergraduates. No systematic relationship was found between extraversion and pain perception, but sex and pain perception were significantly related. Females interpreted lower levels of stimulation as more painful than did male Ss.—*Author abstract*.
147. Melnick, Murray . (Fairfield U) **Need achievement, need affiliation, and perception of laterality in other people.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 467-470.—Proposes a new variable, strategies in

judging laterality of others. 50 female undergraduates who visualized their own body turns ("rotators") in judging which hand was elevated by the facing E scored higher on Edwards Personal Preference Schedule need Achievement than females using an "opposite-hand" strategy ( $n = 65$ ). Rotator's relative ego-centeredness was suggested. Need affiliation was associated with insignificant results but in the predicted direction. Time metaphor and color preferences, although related to need Achievement in the literature, were unrelated to perception of laterality. The responses of 83 males showed no significant differences on any of the measures.—*Journal abstract*.

148. Mikaelian, H. H. (U. Georgia) **Adaptation to displaced hearing: A nonproprioceptive change.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 326-330.—Measured changes in ear-hand and eye-hand coordination following 2 conditions of exposure to sensory rearrangement: (a) auditory rearrangement with pseudophones and (b) visual rearrangement with wedge prisms. A total of 27 undergraduate and graduate students participated in 2 experiments. Results show that listening through pseudophones that rotated the interaural axis by  $30^\circ$  produced systematic changes only in ear-hand coordination. Following visual rearrangement that displaced the field laterally by  $10^\circ$ , both eye-hand and ear-hand coordination manifested response alterations. Results are discussed in arguing against the generality of the proprioceptive change hypothesis of adaptation to sensorimotor rearrangement.—*Journal abstract*.

149. Mo, Suchoon S. (Southern Colorado State Coll) **Comparative judgment of temporal duration in conjunction with contextual variability: A test of a memory-storage model of temporal judgment.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1031-1036.—Conducted 2 experiments with a total of 40 undergraduates to determine applicability of a memory-storage model of temporal judgment to the discrimination of durations. A single dark dot was tachistoscopically presented twice in each trial for judging whether the 2nd duration was longer or shorter than the 1st duration. The tendency to judge the 2nd duration to be longer than the 1st increased as a function of the interval separating the durations only when the interval varied from trial to trial. The overall proportion of "longer" responses was not appreciably greater than the proportion of "shorter" responses.—*Journal abstract*.

150. Moskowitz, Howard R.; Dravnieks, Andrew & Gerbers, Clifford. (U.S. Army Natick Lab., Pioneering Research Lab., Mass.) **Odor intensity and pleasantness of butanol.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 216-223.—A total of 33 students and technicians scaled the odor intensity and the odor pleasantness (or unpleasantness) of *n*-butyl alcohol (butanol) diluted by air in vapor phase. Results were fitted by power functions when the estimates were obtained from ratio scaling procedures. The results of category scaling, from the same Ss, were fitted by logarithmic functions. Although pleasantness and intensity appeared to grow approximately equally rapidly (but in opposite directions) with concentration, the inverse relation held only for the group data, not for the

individual functions. The pleasantness functions were also subject to severe curvature, in contrast to the intensity functions. A level of 300-ppm butanol appears to be hedonically neutral to Ss, being judged neither pleasant nor unpleasant according to the functions obtained from the average estimates. (15 ref)—*Journal abstract*.

151. Murakami, Takashi. (Tokyo U Education, Japan) **[Sensory scaling of weight and the psychophysical function based on ordinal information.]** (Japn) *Japanese Journal of Psychology*, 1974(Apr), Vol 45(1), 1-8.—Determined whether psychophysical confusion, ratio, and partition scales can be considered as a single common scale and, if so, the nature of the appropriate psychophysical function. 3 scales of weight, based on confusion probabilities, direct ratio estimates, and interval estimates were constructed using ordinal information. Data were obtained from a weight-lifting experiment with 42 students and research staff members. Ratio estimates and interval estimates were obtained from 6 Ss for 13 pairs of stimuli. All 42 Ss made paired comparisons for 49 stimuli to obtain confusion probabilities. Results show that all scales could be combined into a single scale through transformation, and that the form of the psychophysical function was a modified power function with one parameter reflecting the time order error. (24 ref)—*English abstract*.

152. Nadelman, M. S. (Albert Einstein Coll of Medicine, Yeshiva U) **On the possible preconscious awareness of impending death.** *Bulletin of the Menninger Clinic*, 1974(May), Vol 38(3), 250-256.—Cites instances when individuals seem to have foretold their impending death. A dynamic interpretation is attempted which compares dreams generated by physical stimuli disturbing sleep with the disease process which disturbs life.

153. Nealls, Perry M. (U Wisconsin, Madison) **Reversal of Stroop test: Interference in word reading.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 379-382.—Since previous research indicates that a component of verbal reaction time, response-choice latency, exists for encoded words as well as color, it was hypothesized that color stimuli could exert a disruptive influence on the processes of this latency to encoded word stimuli, in contrast to the reverse effect which has often been found in the standard Stroop test. 10 undergraduates served as Ss. Stroop-like interference in word reading was produced by pre-exposure of color names printed in colored ink, followed by the presentation of a 2nd stimulus which reinforced the color information of the 1st stimulus. The experimental results do not appear to be an artifact of mere distraction of attention.—*Journal abstract*.

154. Noble, William G. & Lundie, Robert E. (U New England, Armidale, NSW, Australia) **Temporal discrimination of short intervals of dreamless sleep.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 445-446.—Wakened 6 male Ss prior to dream on 3 successive nights and obtained their estimates of sleep duration. Intervals were 60, 30, and 90 min after sleep onset on the 1st, 2nd, and 3rd nights respectively. While daytime estimation was considerably more accurate, Ss showed systematic differences in sleep time estimation. This suggests that temporal discrimination is still possible even in the absence of stored mentation.—*Journal abstract*.

155. O'Donnell, Sean . (Holy Cross Coll, Hamilton, Scotland) **The theory of repressed pre-call: A new approach to personal time.** *Parapsychology Review*, 1974(May), Vol 5(3), 5-8.—Reasons that memory operates in both a forward and backward direction; i.e., future events can be recalled as well as past events but training from infancy causes those in the future to be repressed. Experiments are discussed which show that with considerable training precall accuracy can be developed to a highly significant degree. Initial practice requires 10 hrs or 1,000 single attempts at precall using binary choices. Thereafter, improvement follows at the rate of .5%/hr of practice. In a precall study using 3-digit numbers, after some 20,000 practice attempts competence reached a level where 2 digits out of 3 could be precalled with over 90% consistency. Final *p*-values for all described experiments were in excess of 10<sup>-6</sup>. It is noted that the slightest change in psychological or environmental conditions causes a sharp drop in performance, as do fatigue and stress. Reinstating competence after a loss, however, does not take as much training as was necessary initially.—*P. F. Grim*.

156. Pratt, J. G.; Martin, D. R. & Stribic, F. P. (U Virginia) **Computer studies of the ESP process in card guessing: III. Displacement effects in the C. J. records from the Colorado series.** *Journal of the American Society for Psychical Research*, 1974, Vol 68(4), 357-384.—Examined the comprehensive report by Martin and Stribic (1940) on an extensive series of ESP tests at the University of Colorado, and selected C. J., 1 S of those tests, for further study. In a variety of conditions, with the cards screened from C. J., he averaged 6.8 correct responses on 3,659 runs where 5 would be expected by chance. Using a computerized method of analysis, C. J.'s records were examined for displacement, or hits on targets directly before and after the actual target. Significant displacement effects were found, but their pattern differed from series to series.—*R. A. White*.

157. Schiffman, H. R. & Bobko, Douglas J. (Rutgers State U, New Brunswick) **Effects of stimulus complexity on the perception of brief temporal intervals.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 156-159.—Investigated the influence of stimulus complexity on the perception of brief time intervals with 63 college students as Ss. The stimuli were 6 brief time intervals, ranging in duration from 3 to 23 sec. Each stimulus interval was presented by a display panel of lights whose pattern of lighting varied along 3 levels of complexity: low, intermediate, and high. Results indicate that for all intervals the level of complexity, as defined by the lighting pattern, directly and positively affected time estimations—the greater the level of stimulus complexity within a given time interval, the longer the estimation of the time interval.—*Journal abstract*.

158. Schroth, Marvin L. & Cook, Joseph A. (U Santa Clara) **The influence of type of coin on perception of area, value, and numerosity.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 139-143.—Compared the stability of the 3 perceptual constancies of area, value, and numerosity, using 90 undergraduates as Ss. Different groupings of quarters, dimes, and nickels served as the comparison stimuli in each constancy task. A group of pennies was the standard, and a counterbalanced design

was used. The area and value constancies were significantly affected by the type of coin used in comparison groups, and results were insignificant for numerosity. Overall results support the "new-look" school of perception.—*Journal abstract*.

159. Shiffman, Susan S. (Duke U, Center for the Study of Aging & Human Development) **Physicochemical correlates of olfactory quality.** *Science*, 1974(Jul), Vol 185(4146), 112-117.—Describes a multidimensional scaling procedure which, when extended to a wide range of stimuli, can be used to predict olfactory quality from physicochemical parameters. Recent psychophysical studies which used multidimensional scaling techniques are reviewed to show that a 2-dimensional space adequately describes the relationships among a wide variety of olfactory stimuli. Attempts to determine which psychological and physicochemical parameters describe these spaces are reported, including examination of smell qualities, the molecular formulas of olfactory stimuli, relationships among the functional groups of various compounds, and the characteristics of the Raman spectra of the molecules. Equations for the procedure are presented, and its application to 39 stimuli suggests that the methodology may be of considerable use in finding appropriate physicochemical variables for olfaction since it strictly relates quantitative measures of olfactory quality with quantitative physicochemical measures. (24 ref)—*L. Gorsey*.

160. Smith, Gudmund J. & Sjöholm, Lena . **Can our theory of reality influence our perception of it?** *Psychological Research Bulletin, Lund University*, 1974, Mono Series No 1, 27 p.—Reviews the literature on the situational characteristics of visual afterimage perception and how they are modified by the nature of S's self-other perceptual system. Data from 5 recent experiments by the authors which assessed afterimage perceptual processes in children, normal adults, and psychiatric inpatients are detailed in terms of Piaget's developmental stages, the effects of defense mechanisms (e.g., projection) on marginal perceptual experiences, and aesthetic experience. (18 ref)

161. Spanos, Nicholas P. & Barber, Theodore X. (Medfield State Hosp, MA) **Toward a convergence in hypnosis research.** *American Psychologist*, 1974(Jul), Vol 29(7), 500-511.—Theory construction and research in the area of hypnosis centers around 2 alternative paradigms. One paradigm employs hypothetical constructs such as "hypnotic state" and "trance" to organize the data, while the alternative paradigm rejects these constructs and employs others more closely tied to contemporary social psychology. Recent theoretical formulations proffered by major proponents of both paradigms are reviewed. It is concluded that the 2 paradigms appear to be moving toward a rapprochement on 2 broad generalizations: (a) A willingness to cooperate with the hypnotist constitutes an important but not sufficient condition for hypnotic performance. (b) Ss respond overtly and experientially to hypnotic suggestions when they become involved in suggestion-related imaginings. The empirical evidence supporting both generalizations is summarized, and future research directions are indicated. (96 ref)—*Author abstract*.

162. Stanford, Rex . (St John's U) **An experimentally testable model for spontaneous psi events: II. Psychokinetic events.** *Journal of the American Society for Psychical Research*, 1974, Vol 68(4), 321-356.—Extends the psi-mediated instrumental response (PMIR) model to include PK as a response mode for PMIR. Both laboratory and nonlaboratory observations are reviewed to develop testable assumptions about the psychology and parapsychology of PK function. It is concluded that PK phenomena subserve the organism's needs and are generally nonintentional or unconscious events implicitly guided by ESP. Specific proposals are made as to psychological conditions which facilitate or inhibit PK both as nonintentional PMIR and in intentional or self-conscious contexts. The concept "telepathy" is analyzed, and it is proposed that this term has been used to label 2 distinct classes of events: (a) active ESP scanning by 1 organism of the internal states of another organism, and (b) mental or behavioral influence of an agent upon a target person via PK. 2 distinct constructs are thus required to subsume "telepathic events." Evidence is discussed which supports this schema and empirically testable consequences are considered in detail along with certain methodological requirements.—*Journal abstract.*

163. Starker, Steven . (VA Hosp, West Haven, CT) **Two modes of visual imagery.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 649-650.—Examined, in terms of the vividness factor, the relationship between active thought imagery and a passive, spontaneous mode of mental imagery. Data were derived from a sample of 36 college-age females. Results show a significant consistency within the 2 modes but the relationship between modes remains unclear. Distinction between modes may be important in the design of research on imagery.—*Journal abstract.*

164. Tyler, Dolores M. & Halcomb, Charles G. (Texas Tech U) **Monitoring performance with a time-shared encoding task.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 383-386.—Required 52 college students to perform a task calling for the detection of a critical signal and subsequent differential serial recall. The effects of auditory vs visual mode and independent vs time-shared presentation were investigated. Detection was significantly enhanced under the time-shared presentation mode while serial recall was unaffected. For detection, visual presentation yielded significantly better performance. Effects of time-sharing seem differentially related to the characteristics of the task.—*Journal abstract.*

165. Ward, Lawrence M. (Rutgers State U) **Power functions for category judgments of duration and line length.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1182.—Demonstrates that category judgments of duration and line length are well fit by power functions of the form  $R = aS^n$ . The exponents of the best-fitting power functions ( $n$ ) are .66 for duration and .69 for line length, both smaller than the corresponding average exponents for magnitude estimations (about 1.1 for both continua).

166. Williams, William N.; LaPointe, Leonard L. & Riski, John E. (U Florida) **Lingual discrimination of angular changes of a grooved line by normal subjects.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 579-582.

—Explored the perceptual characteristics of the oral region by requiring 20 17-32 yr old male and female Ss to trace lingually a groove scored in a plastic disc and report its horizontal or vertical orientation. Performance was significantly better in perceiving orientation around the horizontal plane than around the vertical. An angular deviation of 30° was required before all Ss could detect that the groove was not in the horizontal or vertical plane. No significant difference was found in performance by males and females.—*Journal abstract.*

### Auditory Preception

167. Aiken, Edwin G.; Shennum, William A. & Thomas, Gary S. (US Navy Personnel Research & Development Ctr, San Diego, CA) **Memory processes in the identification of pitch.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 449-452.—Conducted a pitch identification study with 30 undergraduates, using 3 interstimulus intervals, a pretest, 3 drills, and a posttest. Results include (a) superior performance on stimuli requiring only a simple discrimination judgment, (b) inferior performance at longer interstimulus intervals, (c) a greater tendency to repeat correct rather than incorrect responses to adjacent tones at the same pitch level, and (d) a modest and reliable improvement in pitch identification accuracy from the pre- to the posttest. Relevance of the results for an interpretation of pitch identification as dependent on memory processes is discussed.—*Journal abstract.*

168. Atal, B. S. (Bell Lab, Murray Hill, NJ) **Effectiveness of linear prediction characteristics of the speech wave for automatic speaker identification and verification.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1304-1312.—Determined 12 predictor coefficients approximately once every 50 msec from the speech of 10 female speakers sampled at 10 kHz. The predictor coefficients and impulse, response, autocorrelation, area, and cepstrum functions were used as input to an automatic speaker-recognition system. The identification decision was based on the distance of the test-sample vector from the reference vector; the speaker corresponding to the reference vector with the smallest distance was judged to be the unknown speaker. In verification, the speaker was verified if the distance between the test sample vector and the reference vector for the claimed speaker was less than a fixed threshold. Among all the parameters investigated, the cepstrum was the most effective. In a separate study to determine the feasibility of text-independent speaker identification, accuracy of 93% was achieved for speech 2 sec in duration even though the texts of the test and reference samples were different. (17 ref)—*Journal abstract.*

169. Bever, Thomas G. & Chiarello, Robert J. (Columbia U) **Cerebral dominance in musicians and nonmusicians.** *Science*, 1974(Aug), Vol 185(4150), 537-539.—14 musically naive and 22 musically experienced right-handed 15-30 yr old Ss performed a 2-note excerpt recognition task to determine whether they could analyze the internal structure of a melody. Musically experienced Ss discriminated the presence of the 2-note excerpts in both ears. No significant differences occurred according to whether the sequence was melodic or rearranged. Musically naive Ss did not discriminate the

excerpts in either ear. All Ss could discriminate instances when a sequence was a repetition from instances when it was not; however this discrimination was better in the right ear for experienced listeners and better in the left ear for inexperienced listeners. These differences were consistent for both melodic and rearranged sequences. In contrast to previous reports, music perception supports the hypothesis that the left hemisphere is dominant for analytic processing and the right for holistic processing.—*L. Gorsey.*

170. Brown, W. S. & Brandt, John F. (U Florida) **The effect of masking on vocal intensity during vocal and whispered speech.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 157-161.—Investigated the ability of normal speakers to control their speech utterances in the absence of acoustic cues. 5 normal Ss were asked to read 10 short colloquial sentences into a tape recorder 5 times in quiet, 5 times under binaural masking at 87 db sound pressure level (SPL), and 5 times at 107 db SPL. In the 1st session they were given no instructions except to read the sentences. Increase in vocal output in even the higher noise ("Lombard Reflex") was only 4.2 db. During a 2nd session Ss were instructed to ignore the noise and read the sentences as before in exactly the same manner each time. The Lombard Reflex was only 2.9 db at maximum. During a 3rd session Ss were instructed to ignore the noise but to whisper the sentence in the same manner each time. Here again, with no acoustic feedback available, vocal output was increased only slightly. Vocal output as measured in SPL and in intra-oral pressure was highly correlated. It is concluded that speakers are able to maintain good control over their vocal intensity during the absence of acoustic feedback, but the present data do not distinguish between 2 possible physiological mechanisms discussed.—*Journal summary.*

171. Chamberlain, Philip J. (Wayne State U) **Pitch and duration in recognition of music-like structures.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 419-428.—Attempted to determine whether patterning of pitch or duration contributes most to the recognition of melodic structures. Tone sequences resembling musical patterns or melodies were used in a recognition memory task performed by 90 male and female undergraduates. 9 categories of pattern complexity were produced by using 3 different levels of average information per tone in each of the 2 dimensions. These categories of tone sequences were presented to groups of Ss and their recognition performance measured. Only patterning of pitch was a significant factor in recognition. Performance was better with larger values of average information per tone, but behavior at maximum values of pitch information suggested that the relationship between performance and pattern information is nonmonotonic.—*Journal abstract.*

172. Cooper, William E. & Blumstein, Sheila E. (Massachusetts Inst of Technology) **A "labial" feature analyzer in speech perception.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 591-600.—Conducted a selective adaptation experiment with 8 paid Ss to determine the ability of various adapting stimuli to alter the perception of a series of 13 synthetic speech syllables. Results indicate that perception of place distinctions among the stop consonants can be altered even by

repetitive listening to certain speech sounds not belonging to the stop-consonant class. (29 ref)

173. Dooling, D. James. (Kent State U) **Rhythm and syntax in sentence perception.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol 13(3), 255-264.—Conducted 2 experiments with a total of 176 undergraduate Ss in which they were required to perceive sentences in noise. A set was induced by presenting a series of sentences that had the same syntax and rhythm. On a final test sentence, either the rhythm alone or rhythm plus surface structure was changed. Changes in rhythm led to major disruptions in performance, while the effect of syntax alone was not significant. Results point out the fundamental importance of rhythm in speech perception and suggest caution in attributing speech perception effects to syntax without controlling for rhythm.—*Journal abstract.*

174. Efron, Robert & Yund, E. William. (VA Hosp, Neurophysiology-Biophysics Research Lab, Martinez, CA) **Dichotic competition of simultaneous tone bursts of different frequency: I. Dissociation of pitch from lateralization and loudness.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 249-256.—Presented 5 right-handed Ss with 2 50-msec tone bursts of 1,500 Hz and 1,900 Hz separated by 1 sec. One ear received the 1,500-1,900 sequence at 1 intensity level while the other ear simultaneously received the reversed (1,900-1,500 Hz) sequence at another intensity level. Ss, who were experienced in psychoacoustic research, were required to report which sequence they heard and its lateralization. A strong ear dominance effect was demonstrated in all 5 Ss for pitch information. A similar dominance for loudness and lateralization was absent. The existence of an ear dominance for pitch but not for lateralization and loudness indicates a striking dissociation in the neural processing of these 2 types of acoustic information. (French & German summaries)—*Journal abstract.*

175. Harbert, Fred; Paris, Deanne & Wenner, Claude. (Thomas Jefferson U., Medical Coll.) **Factors affecting the loudness discrimination of suprathreshold signals increasing or decreasing in intensity.** *Journal of Auditory Research*, 1972(Apr), Vol. 12(2), 149-153.—Employed a monaural suprathreshold test, utilizing steadily increasing or decreasing stimuli, to measure loudness discrimination ( $\Delta I$ ) in 8 normal-hearing Ss. Pure tones of .8-10 sec duration and 1, 2, 4, and 8 db/sec attenuation rates were presented at fixed, increasing, or decreasing intensity levels. Judgments were made for test tones of .25, .5, 1, 2, and 4 kHz presented at 80 and 100 db sound pressure level. The smallest  $\Delta I$ s occurred at the slowest attenuation rate, at the highest frequency, and for the increasing signal direction.—*Journal summary.*

176. Hartley, L. R. & Carpenter, A. (Medical Research Council, Applied Psychology Unit, Cambridge, England) **Comparison of performance with headphone and free-field noise.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 377-380.—Previous studies have found that continuous loud noise presented in the free field causes impairment in a variety of tasks. In the present study with 2 housewives and 14 US Navy enlisted men, performance on the 5-choice serial reaction test in continuous loud noise presented over headphones and in the free field was compared. Sound pressure level

Acc. No.....

was the same in both conditions. Impairment of performance occurred in both noise conditions. The obtained 3-way interaction indicates a tendency for headphone noise to have a larger effect on gaps and for free-field noise to have a larger effect on errors. Differences between the 2 modes of presentation may be related to perceptual deprivation and to annoyance effects of noise.—*Journal abstract*.

177. Henning, G. Bruce . (U Oxford, England) **Lateralization and the binaural masking-level difference.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1259-1262.—Conducted 2 experiments in which 3 Os could readily detect interaural delays in certain complex waveforms even when the energy in the waveform was confined to high-frequency regions. However, the detectability of such complex waveforms was not measurably dependent on interaural phase—there was no masking-level difference with high-frequency signals in spite of the fact that interaural phase effects were readily observed as changes in the apparent location of the source of the signal. (15 ref)—*Journal abstract*.

178. Hines, David & Satz, Paul . **Cross-modal asymmetries in perception related to asymmetry in cerebral function.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 239-247.—Obtained cross-modal correlations between left-right asymmetry on the dichotic listening (DL) test and a visual half-field (VHF) test for 3 groups of 30 undergraduates: right-handed Ss with no family history of left-handedness, right-handed Ss with a positive family history of left-handedness, and left-handed Ss. Both groups of right-handed Ss demonstrated significant cross-modal correlations between DL (auditory) asymmetry and VHF (visual) asymmetry. The left-handed Ss displayed no correlation between DL and VHF asymmetries. This suggests a dissociation between auditory and visual laterality in left-handers. Differences between this finding and 2 previous studies which found no cross-modal asymmetry for right- or left-handers are discussed. The VHF test utilized in this experiment controlled fixation by presenting digits sequentially at fixation, while simultaneously presenting other digits to either the right or left VHF. This procedure minimized the effect of directional scanning on VHF asymmetry. The reliability of the DL and VHF asymmetries was also computed. The DL asymmetry proved to be highly reliable ( $r = .86$ ), while the VHF asymmetry was somewhat less reliable. The asymmetry on both tests is attributed to asymmetry of cerebral function. (French & German summaries)—*Journal abstract*.

179. Jesteadt, Walt & Bilger, Robert C. (Harvard U) **Intensity and frequency discrimination in one- and two-interval paradigms.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1266-1276.—Collected intensity- and frequency-discrimination data for the same 4 undergraduate Ss, using several psychophysical paradigms. No differences were observed that would indicate that frequency discrimination involves fundamentally different decision-making processes than intensity discrimination. Performance in a 2-interval forced-choice task exceeded performance in a yes-no task by a factor greater than that generally predicted. Consistent individual differences were observed in frequency

discrimination but not in intensity discrimination. (34 ref)—*Journal abstract*.

180. Lackner, James R. (Massachusetts Inst of Technology) **Influence of visual rearrangement and visual motion on sound localization.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 291-293.—In an experiment with 12 human Ss, abnormal changes in sound localization occurred during rearrangement of the visual environment and during exposure to optokinetic stimulation. In both of these situations the errors of auditory localization resulted from nonveridical changes in the registration of body posture. (French & German summaries) (19 ref)

181. Lewis, Frederick C. & Kelly, Lynn . (East Carolina U) **Oral stereognosis and auditory discrimination by adults: Summary.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1218.—Studied whether normally articulating adults, who perform inadequately on a standardized auditory discrimination test of sounds removed by place of articulation, also experience difficulty on a standardized measure of oral stereognosis. Data show a significant but relatively low correlation of .39 between errors on the auditory discrimination task and the oral stereognostic measure.

182. Liebman, Jerome . (State U. New York, Albany) **Lateralization of BC sound as studied with EEA techniques: Preliminary note.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 121-123.—Investigated lateralization of bone-conducted sound using electroencephalic averaging audiometry (EEA). A 1-sec tone pulse at 1 kHz was transmitted at 30 db sensation level through a bone conduction transducer centered on the forehead in 6 normal Ss. 4 Ss reported no lateralization, 1 S reported lateralization to the left and 1 S to the right. Amplitudes of evoked potentials (EP) measured at right and left paravertex were larger for Ss reporting lateralization to the contralateral ear. These data are consistent with earlier reports showing maximal representation of auditory EPs contralateral to the stimulated ear. It is suggested that the Weber test may be usefully applied to EEA evaluation.—*M. B. Meikle*.

183. Mitchell, Lilian M. & Singh, Sadanand . (Ohio U) **Perceptual structure of 16 prevocalic English consonants sententially embedded.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1355-1357.—Investigated the use of distinctive features in judging phonemic similarity in connected speech in varying noise and quiet conditions. 16 initial consonants were presented to 5 paid students in monosyllables embedded within a declarative sentence in a position of relative unstress. Ss judged 1680 triads in +6 db, +12 db, and no-noise conditions each. The features stop-fricative, sibilance, voicing, back-front, and velarity were retrieved in the quiet condition, and stop-fricative, sibilance, voicing, and velarity were retrieved in the +12 db and +6 db conditions. When masking interfered, the weighting of the features changed: sibilance and voicing became more prominent in noise while front-back place disappeared. 3 Ss weighted dimensions stop-fricative, sibilant, back-front, voicing, and velarity in descending order, while 1 of the remaining 2 subjects weighted voicing maximally and the other weighted velar place maximally. It is concluded that (a) initial consonants, in sentential

10.3.81  
J 751

contexts judged for similarity, produced results similar to those found from initial consonants in the context of nonsense syllables and (b) the pattern of variance accounted for by similar dimensions varied with signal-to-noise ratio.—*Journal abstract.*

184. Molino, John A. (National Bureau of Standards, Inst for Basic Standards, Washington, DC) **Equal aversion levels for pure tones and 1/3-octave bands of noise.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1285-1289.—14 paid college students tapped rapidly on a telegraph key to reduce the intensity of a continuous acoustic stimulus presented through earphones. Failure to respond resulted in an intensity increase of 1 db every 4 sec. Ss responded during 10-min sessions to 8 pure tones and 8 1/3-octave bands of noise at octave frequencies from 63 Hz to 8 kHz. The average sound-pressure level maintained by the Ss became stable after about 5 min. Different asymptotic levels observed from 5-10 min were taken as a measure of equal aversion levels for the stimuli. Equal aversion levels were compared with other subjective weighting contours and were closest to a weighted sound level of 80-85 db. (17 ref)—*Journal abstract.*

185. Penner, M. J.; Leshowitz, B.; Cudahy, E. & Richard, G. (Bell Telephone Lab, Holmdel, NJ) **Intensity discrimination for pulsed sinusoids of various frequencies.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 568-570.—Results of a study of pulsed sinusoids ranging in frequency from .15 to 12 kHz, employing as Ss 4 paid university students and 1 of the Es, show that, for each tone in this region, Weber's law failed. Theoretical implications of the results are discussed.

186. Perrott, David R. & Baars, Bernard J. (California State U, Los Angeles) **Detection of interaural onset and offset disparities.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1290-1292.—Examined interaural time difference thresholds for transient differences in signal onset and offset in 4 normal, experienced listeners. Lateralization of the acoustic image to either onset or offset transients was observed with signal pulse 1 and 10 msec in duration but not with longer pulses. Interaural difference thresholds for signal onset were observed with smaller time disparities than those obtained with signal offset transients. Both onset and offset transient thresholds were inversely related to signal duration and directly related to signal correlation.—*Journal abstract.*

187. Pohlmann, Lawrence D. & Sorkin, Robert D. (Purdue U) **Binaural masking level differences for pulse train signals of differing interaural correlation.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1293-1298.—Measured binaural masking level differences for 3 normal female undergraduates in a task in which the noise level was controlled by a computer program. The signal in 1 channel was a random polarity train composed of 60 100-μsec pulses with an interpulse period of 2 msec. Signal correlation was varied by (a) randomly inverting some of the pulses, (b) randomly deleting some of the pulses, (c) deleting or inverting some of the pulses contingent on their polarity, or (d) delaying the pulses by an integral number of pulse periods. Data were compared to predictions generated from E. Osman's (see PA, Vol 48:4118) correlation model. Perform-

ance was accurately predicted by the model for conditions (a), (b), and (d). Differences between the model and the data for condition (c) are explained in terms of changes in the monaural detectability of the contralateral signal. (15 ref)—*Journal abstract.*

188. Russell, G. & Noble, W. G. (Macquarie U, North Ryde, NSW, Australia) **Effect of signal frequency on auditory autokinesis.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 173-174.—Reports a study in which the magnitude of auditory autokinetic movement varied systematically with change in signal frequency from .5 to 10 kHz. Other response measures showed no such systematic trend. Data explain the phenomenon more in terms of interaural differences in adaptation than in terms of minimum audible angle.

189. Ryder, Paul; Pike, Ray & Dalglish, Len. (U Queensland, St Lucia, Australia) **What is the signal in signal detection?** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 479-482.—Examined the nature of the stimulus represented along the decision axis in the yes-no auditory detection task. 2 contrasting interpretations, absolute and difference representation of the stimulus, were tested in 2 experiments with 3 and 5 paid Os, respectively, by raising the carrier tone embedded within the background noise to the level of the signal on occasional "catch" trials. Results indicate that difference detection may be the preferred mode of operation when a carrier tone is present and the task is a difficult one. Implications for the theory of signal detectability model are discussed in terms of the relative efficiency of the 2 detection mechanisms.—*Journal abstract.*

190. Stark, Earl W. & Hagness, Don E. (U Illinois, Hearing Clinic) **The Modified Rhyme Test as a test of speech discrimination.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 154-156.—Investigated use of the Modified Rhyme Test (MRT) for assessing speech discrimination. Commercially-available tapes of 3 MRTs of E. J. Kreul et al (see PA, Vol 45:3365) and a W-22 record (List 4) from the Central Institution for the Deaf (CID) were compared in 10 normal-hearing young adults at 10, 20, 30, 40, and 50 db sensation level (SL) for speech reception threshold. MRT Tests B, F, and D were used representing 1 male talker, with noise added designed to yield discrimination scores (DS) of 96, 83, and 75% respectively. DS differences between test-retest means for all 4 tests were negligible (commonly less than 2%), and Pearson test-retest  $r$ 's were all high (.90 or better for MRT lists). Maximum DS was achieved for all tests at about 40 db SL. It is concluded that the MRT tests are equivalent to the CID W-22 tests and have format advantages for many clinic populations.—*Journal summary.*

191. Tolkmitt, Frank J. (U. Melbourne, Parkville, Victoria, Australia) **Latency of sound localization as a function of azimuth and frequency.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 310-316.—Conducted 2 experiments to investigate by means of backward auditory masking the individual localization times of 8 loudspeakers arranged equidistantly on a horizontal azimuth around S. In Exp I 10 20-25 yr olds with balanced hearing had to localize a 20-msec tone of 1,000 Hz, followed by a 500-msec mask of white noise at 1 of 10 delay intervals. Localization accuracy improved

with increasing delay. The notion of differential processing time was supported by the finding that rate of improvement depended on speaker position. To meet the argument that these results could have been caused by the tonal quality of individual speakers, the study was repeated with 18 undergraduates who were rotated by 90°. Frequency of tone was varied so that binaural time differences as well as intensity differences were mediating the localization decision. Despite rotation of S, the same effects as in Exp I were obtained. In addition, localization patterns differed with mediating binaural cues.—*Journal abstract.*

192. Tracy, Russel L. & Tracy, Linda N. (Johns Hopkins U) **Reports of mental activity from sleep stages 2 and 4.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 647-648.—Sought data regarding possible differences in preawakening mentation in sleep Stages 2-4 by comparing reports at the extremes of this range. Ss were 11 males and 10 females, each of whom spent 3 nonconsecutive nights in the laboratory. Stage 2 vs 4 differences in recall, length, and dreamlike quality were not significant; only 1 content comparison was significant. Preliminary data suggest that time in Stage 4 may be negatively associated with intensity of mentation. Findings question the view that intensity of nocturnal mentation is a simple, monotonic increasing function of EEG-defined arousal as reflected in conventional stages of sleep.—*Journal abstract.*

193. Warren, Richard M. (U Wisconsin, Milwaukee) **Auditory pattern recognition by untrained listeners.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 495-500.—Earlier work with unpracticed Ss has indicated that identification (naming) of the temporal order of components within repeated sequences consisting of 3 or 4 unrelated sounds cannot be accomplished when the item durations are 200 msec or less. In the present experiment, 12 groups of 30 unpracticed undergraduates each were required to tell whether alternated sequences, consisting of reiterated presentations of the same 3 or 4 successive items, were in identical or permuted order. Accuracy of same-different judgments was significantly better than chance when all items lasted 200 msec. Changing the duration of each item in 1 of the 2 sequences above or below 200 msec made the task more difficult. Results suggest that (a) identification of order and recognition of auditory temporal patterns may represent fundamentally different processes and (b) recognition may involve matching of "temporal templates."—*Journal abstract.*

194. Wood, Charles C. (Walter Reed Army Inst of Research, Washington, DC) **Parallel processing of auditory and phonetic information in speech discrimination.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 501-508.—Conducted an experiment with 5 adults and the E as Ss to distinguish between 2 models of auditory and phonetic processing: (a) a strict serial model in which auditory information would be processed at one level, followed by the processing of phonetic information at a subsequent level; and (b) a parallel model in which auditory and phonetic processing could proceed simultaneously. Ss identified either an auditory (fundamental frequency) or a phonetic dimension (place of articulation of the consonant) of synthetic consonant-vowel syllables.

When the 2 dimensions varied in a correlated manner, reaction times were significantly shorter than when either dimension varied alone. This "redundancy gain" could not be attributed to speed-accuracy trades, selective serial processing, or differential transfer between conditions. Results allow rejection of a completely serial model, suggesting instead that at least some portion of auditory and phonetic processing can occur in parallel. (50 ref)—*Journal abstract.*

195. Yost, William A. (U Florida, Communication Sciences Lab) **Discriminations of interaural phase differences.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1299-1303.—Asked 3 Os to discriminate between 2 pulsed sinusoids, one presented with an interaural phase delay  $\theta$  and the other presented with a longer delay  $\theta + \Delta\theta$ . Frequency of the sinusoids ranged from 250 to 4000 Hz. The difference threshold for  $\Delta\theta$  increased as  $\theta$  increased from zero degrees to  $\frac{1}{2}$  of the period of the sinusoid, then decreased as  $\theta$  was further increased to a full period of the sinusoid. As  $\theta$  was increased to  $\frac{1}{2}$  of the period of the sinusoid, the lateral image appeared to shift away from midline toward the ear leading in time; but as  $\theta$  was increased beyond  $\frac{1}{2}$  of a period of the sinusoid, the lateral image appeared to shift toward the midline from the ear lagging in time. Results imply that (a) for frequencies less than 2000 Hz, lateral discriminations based on interaural phase differences were more acute toward midline than at either side and (b) for frequencies greater than 2000 Hz, changes in interaural phase were unable to shift the lateral image.—*Journal abstract.*

196. Yost, William A.; Turner, Robert & Bergert, Byron. (U Florida) **Comparison among four psychophysical procedures used in lateralization.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 483-487.—Obtained psychometric functions from 2 normally hearing female university students in 4 lateralization procedures in which Os made discriminations of interaural temporal differences of a 250-Hz tone. The 4 tasks were a single-interval yes-no task, a single-interval left-right task, a 2-alternative forced-choice task, and a 2-interval same-different task. The theory of signal detection provides predictions relating the performances obtained in these 4 procedures. These predictions could not be verified in this experiment when it was assumed that the Os were listening to changes in lateral position produced by the interaural temporal difference. The data are consistent, however, with the assumption that Os used lateral motion as a cue for detection in 2-interval tasks and lateral position as a cue in single-interval tasks.—*Journal abstract.*

197. Young, I. M. (Thomas Jefferson U, Medical Coll) **Descending Bekesy threshold for frequency modulated tones.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 173-178.—Investigated the role of various modulation rates and frequency deviations in threshold determinations, using frequency-modulated (FM) tones. 5 trained Ss listened to a 1,000-Hz fundamental tone modulated so as to produce frequency deviations of  $\pm 10$ -250 Hz. Modulation rate was varied from 1 to 25/sec. Responses were recorded using Békésy audiometric methods. Parametric evaluation of the 2 modulation variables of interest indicated that, for

a given modulation rate, threshold improved with increasing frequency deviation. For a given frequency deviation, as modulation rate increased the threshold became worse. The modulation index (ratio of frequency deviation to modulation rate) was calculated and proved to be directly, but not linearly, proportional to acuity.—*M. B. Meikle.*

### Visual Perception

198. Alexander, Kenneth R. (Illinois Coll of Optometry, Chicago) **Sensitization by annular surroundings: Sensitization and the contrast-flash effect.** *Vision Research*, 1974(Aug), Vol 14, 623-631.—Notes that, in spatial sensitization, the onset of a sensitizing annulus lowers the threshold for a test probe presented concentric with a continuously illuminated disk which fills the center of the annulus. In the contrast-flash effect, the onset of an annulus elevates the threshold for a test stimulus which fills the center of the annulus. In a series of 6 experiments with 2 experienced Ss, stimulus parameters which differ between the 2 paradigms were systematically altered in order to converge on a stimulus configuration in which the annulus would either elevate or lower the threshold for a test stimulus with a change in only 1 or 2 of the stimulus values. Results show that the variables critical in determining the effect of an annulus on the threshold were the presence or absence of a steady disk at the center of the annulus, and for 1 S the size of the test stimulus. (French, German, & Russian summaries) (17 ref)—*Journal abstract.*

199. Allan, Lorraine G. & Kristofferson, A. B. (McMaster U, Hamilton, Ontario, Canada) **Judgments about the duration of brief stimuli.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 434-440.—Presents visual duration discrimination data for 5 Os for stimulus durations between 70 and 1,020 msec. A model for duration discrimination proposed by L. G. Allan et al (see PA, Vol 47:55) is elaborated, and the data are discussed in terms of the model. Data are in agreement with the basic assumptions of the model. Differences between the present data and duration discrimination data presented by others are discussed.—*Journal abstract.*

200. Allen, Jerry C. (U Georgia) **Relationships between visual perception and oral language production of young children.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1319-1327.—Examined the role of visual perception in the oral language production of young children to identify and specify the extent of relationships between certain visual perceptual processes and selected oral language skills. 48 4-8 yr olds were given the Marianne Frostig Developmental Test of Visual Perception. Raw scores on each of the 5 subtests served as measures of the visual perception processes. Measures of selected skills of oral language (syntactical, morphological, and associative skills) were dependent variables. Step-wise regression techniques showed that the visual perceptual processes contributed significantly to explaining the variance of some skills in all aspects of language sampled. Spatial relationships contributed consistently to the morphological and associative skills while constancy of shape contributed to the syntactical skills. (17 ref)—*Journal abstract.*

201. Ambler, Bruce A. (U Texas, Arlington) **Hue discrimination in peripheral vision under conditions of dark and light adaptation.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 586-590.—Results of an experiment with 3 paid undergraduates show that light adaptation lowered peripheral chromatic thresholds, interpreted as due to the lowering of rod sensitivity. It was also found that light in the photochromatic interval appeared blue, indicating that rods may add a blue component to peripheral color vision. (17 ref)

202. Antes, James R. (U North Dakota) **The time course of picture viewing.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 62-70.—Recorded the eye movements of 20 undergraduates as they viewed each of 10 pictures for 20 sec. The informativeness of regions within the pictures was determined independently by subjective ratings from 20 different Ss. Mean informativeness of locations fixated decreased over time and reached an asymptote after about 10 sec of viewing time. Mean duration of fixation showed a steady increase and mean extent of saccadic eye movements showed a steady decrease as viewing time progressed. A pattern of visual exploration was found in which Ss initially made many long saccades to fixate informative elements for short fixations; this behavior gradually evolved to fixating informative features less frequently and with longer examination of less informative details.—*Journal abstract.*

203. Blake, Randolph & Fox, Robert. (Baylor Coll of Medicine, Houston; TX) **Binocular rivalry suppression: Insensitive to spatial frequency and orientation change.** *Vision Research*, 1974(Aug), Vol 14(8), 687-692.—Measured the selectivity of rivalry suppression—defined as sensitivity to new information presented during suppression—by determining the detectability of changes in the suppressed-rivalry stimulus presented to 3 experienced and 2 inexperienced Ss. The stimulus was a vertical grating whose spatial frequency or orientation could be changed without altering contrast or mean luminance. Large changes in frequency and orientation were not detectable. Increments in contrast were detectable, but not decrements. It is concluded that suppression is fundamentally nonselective, remaining insensitive to all classes of stimulus change except those constituting an energy increment. (French, German, & Russian summaries)—*Journal abstract.*

204. Braddick, Oliver. (U Cambridge, Psychological Lab, England) **A short-range process in apparent motion.** *Vision Research*, 1974(Jul), Vol 14(7), 519-527.—Conducted experiments with experienced Os in which a region in an alternated pair of random-dot patterns was uniformly displaced. It was perceived as a segregated, coherently moving shape only if the displacement was small. The limit on the displacement was its absolute size rather than the number of elements' widths. Segregation due to apparent motion did not occur if the 2 patterns were exposed to different eyes. It is suggested that perceptual segregation may be due to the activity of low-level motion detectors of limited spatial range, while classical apparent motion with larger displacements involves a different process. The problem of selection among alternative possible interactions of stimulus elements in apparent motion is discussed. (French,

German, & Russian summaries) (25 ref)—*Journal abstract*.

205. Brigner, Willard L. & Gallagher, M. Brooks. (Appalachian State U) **Subjective contour: Apparent depth or simultaneous brightness contrast?** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1047-1053. —Conducted 3 experiments with a total of 45 undergraduates to test the notion that simultaneous brightness contrast is the basis for subjective contour and that the size of inducing area affects the perceptibility of subjective contour. Data from Ss' rankings of stimuli with the most vivid and readily seen sectors show that the most perceptible sector was the one with the largest inducing area and that the most perceptible subjective contour (sector) occurred when the angle between the radii of a circular figure was 45°; the least perceptible sector occurred at 135°, and there was intermediate perceptibility at 90°. Data from Exp III show that a stimulus configuration lacking differences in brightness was less successful in evoking the perception of subjective contour than a stimulus containing differences in brightness. Depth cues failed to sustain the perception of subjective contour with a reduction in simultaneous brightness contrast. (15 ref)—*L. Gorsey*.

206. Ciardullo, Robert C. & Gallon, Robert L. (Vassar Coll) **Magnitude estimations of brightness for lights of different wavelengths.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 21-27. —Employed a magnitude estimation procedure to obtain brightness estimations for 16 college students with normal color vision, using lights of different wavelengths. Color filters were combined to produce wavelength bands of 460-470, 520-540, 590-610, and 680-700 nm. Light intensity was varied over a wide range by neutral density filters. The results were 4 power functions whose exponents decreased monotonically from .37 for the short wavelength band to .28 for the long wavelength band. These exponents were compared to the exponent of .33 typically obtained for white light. Treating the exponents as linearly related to wavelength yielded an equation predicting the exponent for any wavelength within the range tested.—*Journal abstract*.

207. Collins, James F.; Newman, Patrick A. & Hutson, Stanley P. (U Missouri, Kansas City) **Personality correlates of visual perceptual responses.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1183-1187. —Measured 28 undergraduates' responses to word recognition tasks as a function of certain personality characteristics assessed by Rotter's Internal-External Control Scale and the Paranoia, Social Introversion, and Lie scales of the MMPI. 14 Ss saw a list of 20 neutral words and 14 saw a list with 4 taboo words interspersed. Recognition accuracy was independent of personality characteristics; however, the recognition confidence ratings of Ss differed significantly as a function of each of the personality variables. It is concluded that personality should be considered in assessing responses in certain types of perceptual experimentation. (15 ref)—*Journal abstract*.

208. de Weert, Ch. M. & Levelt, W. J. (U Nijmegen, Netherlands) **Binocular brightness combinations: Additive and nonadditive aspects.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 551-562. —Used a conjoint

measurement procedure with 2 trained male Ss to measure binocular brightness as a function of left and right luminance inputs. For nonzero stimulation, the data confirm earlier findings: the system can be described as additive with a scale exponent of 1. If zero stimulation was included, however, no additive solution was found (due to Fechner's paradox). A model is proposed which takes account of Fechner's paradox, and incorporates "realistic" exponents without requiring a multistage processing mechanism where different levels are characterized by different sensory scales. The model makes the weighting coefficients for the 2 eyes dependent in a continuous way on the strength of stimulation in the 2 eyes, especially on the amount of contrast of the monocular stimuli. For zero background stimulation, contrast can be expressed in terms of luminance of the stimulus. In this way, the model is reduced to a simple testable form. (24 ref)—*Journal abstract*.

209. Dember, William N.; Steffl, Mary & Kao, Kathy C. (U Cincinnati) **Backward masking of gratings varying in spatial frequency.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 439-441. —In a previous study using disk-shaped targets with varying numbers of internal pie-shaped segments, some targets were unmaskable and the detectability of others was enhanced by the masking stimulus. The present study with college students, using disks with gratings varying in spatial frequency, replicated previous findings except that there was little backward enhancement. (18 ref)

210. Engel, F. L. (Inst for Perception Research, Eindhoven, Netherlands) **Visual conspicuity and selective background interference in eccentric vision.** *Vision Research*, 1974(Jul), Vol 14(7), 459-471. —Describes experiments on the influence of test-object background factors on the size of the retinal field in which the relevant object can be discovered from its background during a brief presentation. There was size- and luminance-selective interference by background stimuli on the perceptibility of the test stimulus in eccentric vision. The size of the conspicuity area was a summation of the separate influences of diameter and luminance contrast relative to the background. (French, German, & Russian summaries) (46 ref)

211. Erwin, Donald E. & Hershenson, Maurice. (Brandeis U.) **Functional characteristics of visual persistence predicted by a two-factor theory of backward masking.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 249-254. —Conducted 2 experiments with a total of 13 psychology graduate students. In Exp I backward masking was obtained for 50-msec targets of 7 consonants using a visual noise mask. Masking was equally effective in monoptic, dichoptic, and binocular viewing of target and mask separated by interstimulus intervals of 0, 50, or 100 msec but not at 150 msec. In Exp II postoffset persistence was measured for a blank field, a dark field, and a field containing 7 letters using a subtractive reaction time (RT) procedure. When only RT was required, persistences were the same for the 3 fields; when report of the contents of the visual representation was required in addition to the motor response, the persistence of the field containing the letters was about 35 msec longer. Results are discussed

within the framework of a 2-factor theory of backward masking.—*Journal abstract.*

212. Findlay, J. M. (U Durham, England) **Direction perception and human fixation eye movements.** *Vision Research*, 1974(Aug), Vol 14(8), 703-711.—Investigated involuntary movements of the eye during fixation which give rise to a problem concerning location in visual space. A psychophysical task was used in Exp I in which 3 normally seeing Ss judged the relative positions of 2 stimuli briefly flashed on a screen and separated by a temporal interval. S's ability to compare 2 directions in space decreased with time in a manner which suggests that the judgment was achieved on the basis of retinal position only and that correspondence with external direction changed as the eye drifted. Microsaccadic eye movements made by 4 Ss in Exp II were recorded while the same task was carried out. When S made a microsaccade, errors in location showed that a shift in perceived direction occurred toward the direction of the microsaccade. A model to explain the results based on a form of corollary discharge is postulated. (French, German, & Russian summaries) (27 ref)—*Journal abstract.*

213. Franken, R. E. & Rowland, G. L. (U Calgary, Alberta, Canada) **Visual memory: Accuracy of decisions of familiar-novel for tachistoscopically presented stimuli.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1039-1043.—Showed 150 novel and familiar color slides successively for 5 sec each to 92 undergraduates. A recognition test was then given consisting of 15 new and 15 previously-shown slides. 8 conditions of exposure were used in recognition: 20, 200, 350, 500, 750, 1,000, 2,500, and 5,000 msec; each S had only a single duration of exposure for each test stimuli. Results show that as the duration of exposure increased, the accuracy of recognition rapidly increased, becoming asymptotic before 500 msec. Decisions of novelty were more accurate than decisions of familiarity at all durations of exposure. Lower overall accuracies for familiar decisions resulted from the high error rates for certain familiar stimuli.—*L. Gorsev.*

214. Glezer, V. D.; Leushina, L. I.; Nevskaya, A. A. & Prazdnikova, N. V. (USSR Academy of Sciences, I. P. Pavlov Inst of Physiology, Leningrad) **Studies on visual pattern recognition in man and animals.** *Vision Research*, 1974(Jul), Vol 14(7), 555-583.—Discusses 3 types of recognition performance, using data from experiments with both animal and human Ss. The 1st and 3rd recognition types are characterized by independence of the amount of information received about the time of its processing; the 2nd type involves the linear relationship between these quantities. It has been demonstrated in regions of the animal cortex that mechanisms responsible for different types of recognition have different sites in the cortex. Visual images in man are invariant under size transformation and rotation around the vertical axis. Invariant recognition of visual images in man is determined by the existence of separate channels to process the information concerning the shape of an object and its spatial characteristics. Progressive development of the capability of invariant recognition of visual images in the course of evolution has been demonstrated.

(French, German, & Russian summaries) (77 ref)—*Journal abstract.*

215. Hagen, Margaret A. (Boston U) **Picture perception: Toward a theoretical model.** *Psychological Bulletin*, 1974(Aug), Vol 81(8), 471-497.—Describes J. J. Gibson's new theory of picture perception and a program of research within his framework. An analysis of pictorial information is proposed in which a systematic investigation of the structural components of pictures and their varying effects on perception is seen as preliminary to the postulation of hypothetical pick-up mechanisms. The basic components of pictures are described, and literature is reviewed in the problem areas of distorted and impoverished information, observation from the wrong station point, coexisting flatness and depth information, and the ambiguity of the source of a single projection. The feasibility of the Gibsonian enterprise is demonstrated, and further avenues for research into a structural analysis of pictorial information are noted. (48 ref)—*Journal abstract.*

216. Harris, Lauren J.; Ellen, Ellen A. & Marshall, Suzanne P. (Michigan State U) **What is the "front" of a simple geometric form?** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 571-580.—Tested a total of 670 undergraduate Ss in 3 studies in an attempt to define a set of cues that minimally specify perceived "frontness" and "backness" of objects. In Exp I Ss were instructed to identify the "front" and "back" of printed squares to which no, 1, or 2 circles were attached. In Exp II different Ss made the same kind of judgment to a wider range of geometric forms. In Exp III different Ss judged the direction of "imagined" movement of forms from Exp I. Results indicate that the "front" and "back" are asymmetric opposite sides, with "front" the side most different from the rest and the side toward which the form is imagined to be moving.—*Journal abstract.*

217. Harvey, Lewis O. & Michon, John A. (U. Colorado) **Detectability of relative motion as a function of exposure duration, angular separation, and background.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 317-325.—Used a signal detection design to measure detection thresholds for the motion of 1 spot of light relative to a stationary spot. Ss were 30 college students. Angular separations from 7.5 sec to 2°, exposure durations from .5 to 4 sec, and inward and outward motion were used with and without a textured background. An increase in angular separation lowered thresholds measured in minutes of arc/sec. Increases in exposure duration lowered motion thresholds, but raised the total angular distance moved during exposure. Textured background had no effect. Results are related to previous findings and to following another automobile at night. (26 ref)—*Journal abstract.*

218. Hirsch, Joy; Schneider, Bruce & Vitiello, Michael. (Columbia U) **The effects of adaptation to square-wave gratings as a function of grating orientation.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 475-478.—Used an adaptation technique to measure the selectivity or tuning for grating orientation in the visual system for different orientations of the inspection stimulus. Duration thresholds for grating patterns of constant luminance were determined for 13 test gratings oriented from  $\pm 5$  to  $90^\circ$  away from each of 5

adaptation gratings: 0, 22, 45, 67, and 90°. Threshold data for the Os (2 of the authors) obtained for test gratings without prior adaptation indicated higher sensitivity for gratings oriented along the horizontal and vertical axes than along the oblique axis. After adaptation, thresholds increased for gratings having similar orientations as the test gratings. However, the functions relating sensitivity reduction to degree of angular disparity between test and adaptation grating did not vary across the 5 inspection orientations.—*Journal abstract*.

219. Holmgren, John E. (U Maryland) **The effect of a visual indicator on rate of visual search: Evidence for processing control.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 544-550.—Conducted 2 experiments with a total of 18 paid university students in which search rates were estimated from response latencies in a visual search task of the type used by R. C. Atkinson et al (see PA, Vol 44:4392) in which an S searches a small set of letters to determine the presence or absence of a predesignated target. Half of the visual displays contained a marker above one of the letters. The marked letter was the only one that had to be checked to determine whether or not the display contained the target. The presence of a marker in a display significantly increased the estimated rate of search, but the data indicate that Ss did not restrict processing to the marked item. Results demonstrate that Ss are able to exercise some degree of control over the search process in this type of task.—*Journal abstract*.

220. Holt-Hansen, Kristian. (Copenhagen U, Psychological Lab, Denmark) **Experienced rings around the intersection point in the Hering illusion.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 639-646.—Exposed 19 Ss, most of them university students, to the Hering illusion. Besides oscillation of the parallel lines, Ss experienced different kinds of rings around the intersection point of the rays. These rings were most frequently a number of circles and less frequently ellipses. The colors of the rings contrasted with the colors of the Hering illusion. The fact that straight lines may condition the experience of rings (circles or ellipses) is juxtaposed with the results of another experiment, which demonstrated that a circle as stimulus conditioned the experience of straight lines as radii in the circle.—*Journal abstract*.

221. Isseroff, Ami; Carmon, Amiram & Nachshon, Israel. (Hadassah-Hebrew U, Medical School, Aranne's Lab of Human Psychophysiology, Jerusalem, Israel) **Dissociation of hemifield reaction time differences from verbal stimulus directionality.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 145-149.—Examined 2 hypotheses explaining visual hemifield reaction time (RT) differences in 2 experiments with a total of 16 right-handed college students. The RTs to normally oriented and to mirror-image English words were compared in the right and left fields in order to decide whether cerebral dominance or scanning tendencies account for field superiority. Both types of words yielded faster verbal and manual RTs in the right visual field. This finding, as well as a supplementary finding of more accurate recognition for mirror-image words in the right visual field, support the cerebral dominance hypothesis. (19 ref)—*Journal abstract*.

222. Johnson, Richard M. & Uhlarik, John J. (Kansas State U) **Fragmentation and identifiability of repeatedly presented brief visual stimuli.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 533-538.—Gave 60 undergraduates repeated brief presentations of geometric forms and required them to draw what they thought they saw. Stimulus patterns were presented tachistoscopically for as many repetitions as necessary for correct identification. The nature and sequential properties of pattern fragments reported prior to correct identification were examined. The 1st fragments to be reported were generally straight line elements of the stimulus patterns. With repeated presentations, more features were reported until the complete figure was correctly identified. The pattern of construction appeared similar to patterns of fragmentation found in research on stabilized retinal images, prolonged afterimages, and conditions of steady fixation. Implications for theories of pattern information processing are discussed. (17 ref)—*Journal abstract*.

223. Kelly, D. H. (Stanford Research Inst., Menlo Park, Calif.) **Spatio-temporal frequency characteristics of color-vision mechanisms.** *Journal of the Optical Society of America*, 1974(Jul), Vol. 64(7), 983-990.—Inferred spatio-temporal sine-wave response functions for the red-, green-, and blue-sensitive receptor mechanisms of the visual process, by selective chromatic-adaptation experiments with 3 Os and by Weber-law calculations. The complete spatio-temporal threshold surface for each cone mechanism was abbreviated to 4 critical profiles: 2 contrast-sensitivity curves measured at the temporal frequencies of minimum and maximum sensitivity and 2 flicker-sensitivity curves measured at the spatial frequencies of minimum and maximum sensitivity. Throughout most of the spatio-temporal frequency domain, the green sensitivity was greatest, the red less, and the blue least of all. The curve shapes can be qualitatively explained in terms of antagonistic interactions in the early visual pathways. (20 ref)—*Journal abstract*.

224. Kjellberg, Anders. (U Uppsala, Psychological Inst, Sweden) **Effects of sleep deprivation on voluntarily controlled reversal rate of ambiguous figures.** *Scandinavian Journal of Psychology*, 1974, Vol 15(2), 149-153.—Studied the effects of sleep deprivation (SD) on the reversal rate of the Necker cube and Rubin's vase-faces figure with instructions to 16 paid undergraduate Ss both to maximize and to minimize the rate. 3 viewing conditions were used: free eye movements, eyes on a fixation point, and reversals of an afterimage of the figure. SD increased the rate under minimizing instructions and decreased the rate under maximizing instructions. Results are interpreted in terms of an accelerated satiation process and an impairment of attentional control. (17 ref)—*Journal abstract*.

225. Koenderink, J. J. & Van Doorn, A. J. (State U Groningen, Biological Ctr, Netherlands) **Detectability of two-dimensional band limited noise.** *Vision Research*, 1974(Jul), Vol 14(7), 515-518.—Compares measurements of limited 2-dimensional gaussian noise with measurements of the thresholds for detection of spatial sine waves. At low spatial frequencies the sensitivity of the visual system for sine waves increases with frequency, while that for the noise bands decreases with spatial

frequency. (French, German, & Russian summaries) (21 ref)

226. Lackner, James R. (Brandeis U) **Adaptation to displaced vision: Role of proprioception.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1251-1256. —Conducted 2 experiments with a total of 24 undergraduates to determine (a) whether Ss could adapt to visual rearrangement if they were permitted tactile and proprioceptive feedback, but not visual feedback, from their pointing movements toward visual targets; and (b) whether veridical proprioceptive feedback about the visual target location has to be available if adaptation is to occur when S cannot see his hand during the exposure to the visual rearrangement. It is concluded that adaptation to visual rearrangement requires neither the sight of the moving hand during exposure or visual error information about the discrepancy between the seen locations of the hand and another object in the visual field to which S has attempted to point, and that visual-proprioceptive discordance is a necessary as well as a sufficient condition for adaptation to occur. (17 ref)—L. Gorsey.

227. Lajoy, Ronald J. & Seethoff, Patrick M. (U Connecticut) **Effects of familiarity, verbal response, and practice on a visual search task.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1311-1314. —Studied the effects of familiarity, type of verbal response by the E (positive or negative), and practice on a visual search task by randomly assigning 42 undergraduates to bivariate conditions in a discrete search task of 20 trials. Search time for familiar English letters was significantly faster than for unfamiliar Greek letters; there was a significant decrease in search time over trials; and type of verbal response, as well as interactions, produced no significant effects.—*Journal abstract*.

228. Levy-Schoen, Ariane. (U Paris V—René Descartes, Lab of Experimental & Comparative Psychology, France) **[The field of visual fixation: Experimental data.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 43-65. —Conducted a series of experiments to determine which of several equivalent objects appearing at different places in the visual field would attract the eye first. The "attraction value" of a visual target depended on its location relative to the previous fixation point. The attraction lessened as the target was more off center, and was lowest in the bottom part of the field. There was a strong tendency to fixate the closest objects first. It was easier to induce the eyes to respond first to targets appearing in a certain direction in the field than to those appearing at a certain distance from the center. These rules were apparently related to the field of activity rather than to the field of stimulation: the left-right balance of the effect remained when the stimulated hemi-retinas were dissociated and the strength of nearby stimuli was only partly related to the higher intensity of the retinal excitation. These data are consistent with the idea of a basic regulation of ocular exploration such that foveal vision complements the gathering of information already located and partially organized by peripheral vision.—G. Rubin-Rabson.

229. Locher, Paul J. (Montclair State Coll) **Eye-movement parameters and total figure complexity of simple geometric shapes.** *Perceptual & Motor Skills*,

1974(Apr), Vol 38(2), 485-486. —Describes an experiment with 12 undergraduates which provides support for the value of the measure, total figure complexity, of the model of perception of simple geometric figures developed by P. C. Vitz and T. C. Todd in predicting eye-movement parameters of Ss performing a learning task.

230. Loiseau, Lucien. **[Experimental study of H. Jasper's method for determining visual dominance.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 35-42. —In Jasper's experiment, the S looks at the farther or nearer of 2 lights which go on and off alternately. The fixation point was adjusted to appear exactly in the center between the double images of the other light. The speed of alternation was modified until a phi phenomenon appeared. Ss were classified according to the type of dominance indicated by their response. Exp I indicated the presence of experimental artifacts (incorrect adjustments) and in Exp II no consistency was demonstrated when the S passed from one adjustment to another. It is concluded that Jasper's method cannot be used to determine dominance.—G. Rubin-Rabson.

231. Magnussen, Svein & Torjussen, Tore. (U Oslo, Inst of Psychology, Norway) **Sustained visual afterimages.** *Vision Research*, 1974(Aug), Vol 14(8), 743-744. —Investigated the mechanism of prolonged afterimages induced by brief, high-intensity flashes presented to 2 Ss against intermittent background illumination. Results show that duration and visibility of the afterimages increased steadily as background frequency was reduced from 8 to .5 Hz. It is suggested that neural adaptation of border and contrast subserving mechanisms, as well as regeneration of bleached pigments, are involved in the final decay of the afterimage.

232. Marks, Lawrence E. & Bornstein, Marc H. (Yale U) **Spectral sensitivity of the modulation-sensitive mechanism of vision.** *Vision Research*, 1974(Aug), Vol 14(8), 665-669. —Employed a procedure of critical flicker threshold to measure the spectral sensitivities of 2 Ss (the authors). The shape of the spectral sensitivity curve depended systematically on the frequency and percentage of temporal modulation. The variations in spectral sensitivity were consistent with 2 different sets of deLange characteristics. (French, German, & Russian summaries)

233. McCarthy, S. Viterbo. (Regis Coll) **Visual serial search for letters, Roman and Arabic numbers.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1077-1078. —Data from visual search performances for letters and Roman and Arabic numbers of 30 female undergraduates and 21 secondary school teachers show that across 30-sec trials with a 30-sec rest interval between target displays, visual serial search for Arabic numbers was significantly superior to search for letters and search for letters was significantly superior to search for Roman numerals.

234. McGlynn, F. Dudley; Hofius, David & Watulak, Gary. (Bryce Hosp, Tuscaloosa, AL) **Further evaluation of image latency and reported clarity as functions of image-complexity.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 559-565. —Conducted 2 experiments, each with 20 undergraduates, in which Ss imagined single common animals, animal pairs, and animal triads on separate trials. As the number of to-be-imagined animals

was increased, Ss took longer to form the image and rated the image as less clear. Results support the view that imaginal behavior is a proper domain of psychological study.—*Journal abstract.*

235. Metzger, Kurt R.; Warm, Joel S. & Senter, Roderick J. (U Cincinnati) **Effects of background event rate and critical signal amplitude on vigilance performance.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1175-1181.—80 undergraduates monitored a display consisting of the repetitive presentation of pairs of movements of a bar of light. A neutral background event, for which no overt response was required, was a double deflection of 24 mm. The critical signal for detection was a longer deflection in the 2nd movement within an event. Detection probability was greater for incremental excursions of 33% relative to 8.3% of the base movement. This effect was doubled when the event rate in which the signals were embedded was 21 as compared to 6 events/min. Results are considered in terms of the elicited observing rate hypothesis proposed by H. J. Jerison (1970).—*Journal abstract.*

236. Metzger, Erica & Rosenberg, Steven. (Bernard W. Schlesinger Foundation, New York, NY) **Right and left orientation in pictures.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 471-478.—In Exp I, 13 male and 13 female undergraduates rendered aesthetic preferences for left vs right views of each of 12 pictures which offered a prediction of preference for 6 views toward the left, 6 toward the right. The criterion of view preference was within-picture unification. 2 predictions were confirmed, while no differences in the nonpredicted direction reached significance. Exp II used the same stimulus materials with 8 male and 9 female Ss, each of whom received minimal training in left-right discrimination. 3 predictions were confirmed, with no differences at all in the nonpredicted direction. Training in Exp II, though not completely ineffective, was not perceived to have a significant effect. The correlation between the performances of the naive and trained groups on the 12 pictures was significant. Results justify further exploration.—*Journal abstract.*

237. Moorhouse, C. E. (Ed.). (U Melbourne, Vic, Australia) **Visual education.** Carlton, Australia: Pitman Australia, 1974. 187 p.—Presents a collection of 12 descriptive and discussion papers on the theory and function of visual language and perceptual processes. Topics include the human information processing of visual images, visual language in the fine arts, technology and science, engineering, and everyday life, and education and visual experience. (9 p ref)

238. Norren, Dirk V. & Padmos, Pieter. (Inst for Perception TNO, Soesterberg, Netherlands) **Dark adaptation of separate cone systems studied with psychophysics and electroretinography.** *Vision Research*, 1974(Aug), Vol 14 (8), 677-686.—Measured dark-adaptation curves using psychophysical and electroretinographic (ERG) methods with 3 human Ss and the ERG method with 2 rhesus monkeys. The time constant for the blue-cone system dark-adaptation curve was measured on a strong yellow background to suppress the red- and green-sensitive systems. Dark adaptation developed more slowly in the fovea than in the periphery. The time constant of the foveal red-green system dark adaptation

was 90 sec and that of the blue system was 140 sec. A good correspondence was noted between the human psychophysical and ERG data, and between human and monkey ERG data. It is hypothesized that the simultaneous regeneration of the red and green cones explains the slow blue-cone dark adaptation. (French, German, & Russian summaries) (26 ref)—*Journal abstract.*

239. Ornitz, E. M.; Brown, M. B.; Mason, Anne & Putnam, N. H. (U California, Medical School, Los Angeles) **The effect of visual input on post-rotatory nystagmus in normal children.** *Acta Oto-Laryngologica*, 1974(Jun), Vol 77(6), 418-425.—Measured the duration, total number of beats, and frequency of postrotatory nystagmus in 25 normal 3-7 yr olds under different conditions of visual input. After rotation in darkness, the effects of fixation without light, fixation in light, and light without fixation on the nystagmus evoked by an abrupt braking deceleration were studied. The postrotatory nystagmus duration and the total number of beats were significantly reduced both by fixation without light and by light without fixation. Findings are discussed in relation to mechanisms by which vestibular nystagmus may be suppressed. (German summary)—*Journal abstract.*

240. Posey, Thomas B. & Runyon, John C. (Murray State U) **Intercorrelations of numerosity recognition, IQ, and anxiety in college students.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1054.—Administered a visual numerosity recognition task, the Institute for Personality and Ability Testing Anxiety Scale Questionnaire, and the Quick Word Test to 100 undergraduates. Data show (a) no significant correlations between IQ and 2 out of the 3 numerosity scores, (b) a significant negative correlation between IQ and anxiety, and (c) small significant negative correlations between IQ and the 3 numerosity scores.

241. Pressey, A. W. & Wilson, A. E. (U Manitoba, Winnipeg, Canada) **The Poggendorff illusion in imagination.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 447-449.—Tested undergraduates on the Poggendorff illusion with the angle of the oblique line varying from 20 to 30°. Ss were asked to project either an objective oblique line or an imagined oblique. Imagining the oblique line did not produce a smaller illusion, contradicting theories that distortions are retinal in origin and supporting judgmental theories.

242. Remole, Arnulf. (U Waterloo, Optometry School, Ontario, Canada) **Luminance thresholds for perceived movement in a flickering field.** *Journal of the Optical Society of America*, 1974(Aug), Vol 64(8), 1133-1135.—In a test with 7 humans with normal vision, a uniform flickering field was perceived as containing spatial and temporal articulations quite unlike the stimulus. Among these was an apparent oscillatory rotation of perceived patterns. The stimulus luminance required for the perception of such movement was determined for various stimulus frequencies. This threshold lay consistently higher than the luminance threshold for 1 broad category of perceived patterns—those exhibiting geometrical features. It is concluded that the oscillatory movement depends on such patterns exposed at a certain luminance increment above their threshold.—*Journal abstract.*

243. Richards, Whitman & Dichgans, Johannes. (Massachusetts Inst of Technology) **Effect of directional-flow patterns upon motion thresholds.** *Journal of the Optical Society of America*, 1974(Aug), Vol 64(8), 1148-1149.—Results of a demonstration of directional motion selectivity in 7 human Ss indicate a selective inhibitory interaction between background and target motion only if the 2 were moving in the same direction and were seen in the same depth plane.
244. Rogers, Robert A. & Sanders, Raymond E. (U Minnesota, Minneapolis) **Effects of order presentation and length of viewing time on size estimation.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 511-517.—Describes an experiment, based on the interpretation by R. W. Gardner et al, of the leveling-sharpening dimension, which manipulated the order of presentation and length of viewing time on a size-estimation task presented to 48 undergraduate Ss. Contrary to expectation, neither variable significantly affected performance, and 4 different subject-estimation patterns were isolated rather than the 2 patterns (leveling and sharpening) expected. Both magnitude and directional properties of the 4 estimation patterns are explained by a modified version of A. Parducci's range-frequency model.—*Journal abstract.*
245. Schindler, Robert M.; Well, Arnold D. & Pollatsek, Alexander. (U Massachusetts, Amherst) **Effects of segmentation and expectancy on matching time for words and nonwords.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 107-111.—Previous studies indicate that Ss can perceive words more rapidly than nonwords. It may be, however, that this word superiority effect (WSE) is considerably reduced when Ss are not expecting wordlike stimuli, as reported by D. Aderman and E. E. Smith (1971). The present study used segmentation (the insertion of spaces after the 2nd and 4th letters of 6-letter strings) to assess the effect of a configurational change on matching times for words and nonwords under different expectancy conditions. Ss were 94 undergraduates. When Ss expected both words and nonwords, segmentation lengthened the matching latencies equally for words and nonwords. However, when instructions led Ss to expect only nonwords, the segmentation manipulation resulted in a reduced WSE. Data suggest that although segmentation lengthens matching time, it affects the WSE through its influence on expectancies rather than by more direct perceptual influence. Results are discussed in terms of K. T. Spoehr and E. E. Smith's 1973 model of word perception.—*Journal abstract.*
246. Seaman, Anna C. (Texas A&M U) **Responses of lower- and middle-class 5-yr.-old children to achromatic and chromatic color and form stimuli.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1257-1258.—Reports that form and color sorting by 80 5-yr-olds was unaffected by sex or race, but middle-class children showed a significant preference for form and lower-class children for color, regardless of whether stimuli were chromatic or achromatic.
247. Sherman, Julia A. (Women's Research Inst of Wisconsin, Wisconsin Psychiatric Inst, Madison) **Field articulation, sex, spatial visualization, dependency, practice, laterality of the brain and birth order.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1223-1235.—Among 25 female and 25 male undergraduates, 3 measures of field articulation (rod-and-frame test—RFT, Group Embedded Figures Test, and the Draw-A-Person Test) were correlated with a measure of spatial visualization (Space Relations subtest of the Differential Aptitude Test), but not consistently with each other or with a measure of dependency (the Succorance scale of the Edwards Personal Preference Schedule). Practice significantly affected RFT performance for both sexes, but no sex differences were found on the other field articulation and dependency measures. Males had significantly higher mean spatial visualization scores and were more confident than females on RFT performance although they were no more accurate. Among Ss who were the oldest of their siblings, females were less field articulated, and males were more. Males had more RFT errors when the frame top was tilted to the left of S, but females had more errors when it was tilted to the right, a finding which is consistent with the hypothesis that, for females, control of spatial function is located in the left hemisphere of the brain more frequently than it is in males. (38 ref)—*Journal abstract.*
248. Somers, William W. & Fry, Glenn A. (Ohio State U., Coll. of Optometry) **Relation of macular pigment and photoreceptor distribution to the perception of a brightness difference.** *American Journal of Optometry & Physiological Optics*, 1974(Apr), Vol. 51(4), 241-251.—Studied the effects of using the criterion of minimum border and brightness equality in making matches between white and monochromatic half-disks. 4 males with normal acuity and color vision served as Ss. As long as the S fixated a point at the center of the bipartite pattern and the effects of blur and overlap or separation were reduced to a minimum, the 2 criteria yielded essentially the same results. Differences in matching could be found when bipartite fields of different size were used. These appear to be attributable to macular pigment and the distribution of photoreceptors.—*Journal abstract.*
249. Stabell, Ulf & Stabell, Bjorn. (U Oslo, Psychological Inst, Norway) **Scotopic contrast hues displaced toward blue.** *Scandinavian Journal of Psychology*, 1974, Vol 15(2), 146-148.—Prestimulation with a neutral white light in a dark-adapted state produced a disposition in 2 human Ss for a scotopic hue of violet of about 463 nm. The observation may be explained on the basis of H. Helmholtz's 1896 theory of complementary negative afterimages, providing that certain qualifying assumptions are made. (15 ref)
250. Thomas, James P. & Shimamura, Keiko K. (U California, Los Angeles) **Perception of size at the detection threshold: Its accuracy and possible mechanisms.** *Vision Research*, 1974(Jul), Vol 14(7), 535-543.—Conducted 3 experiments in which 5 experienced Os judged the sizes of foveal stimuli, 10-50 min of arc diameter, presented at luminances bracketing the detection threshold. Each stimulus was perceived as having a definite size which covaried with physical size. If the diameters of 2 stimuli differed by more than a factor of 2, the Os discriminated the 2 stimuli from each other better than they discriminated either from random fluctuations in the background. 3 possible models of

such size perception were evaluated using uniformly illuminated disks, clusters of small dots, and annuli as stimuli. Results support the multiple, size-tuned channel model. (French, German, & Russian summaries) —*Journal abstract.*

251. **Thorn, Frank & Boynton, Robert M.** (Pacific U, Coll of Optometry) **Human binocular summation at absolute threshold.** *Vision Research*, 1974(Jul), Vol 14(7), 445-458.—Demonstrates that the neural inputs of 2 stimuli presented simultaneously to corresponding retinal areas summate physiologically to lower the binocular absolute threshold. A model allowing one to calculate the minimum amount of physiological summation or inhibition that occurs under different conditions is presented. (French, German, & Russian summaries) (67 ref)

252. **Tomie, Arthur & Thomas, David R.** (U Colorado) **Adaptation level as a factor in human wavelength generalization.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 29-36.—According to an adaptation level interpretation, central tendency effects in stimulus generalization should occur within but not across conceptual categories. This interpretation was examined in 2 experiments with a total of 120 female undergraduates. In Exp I, 2 groups of Ss viewed a 505-nm (green) light and were tested for generalization with only shorter (bluer) or only longer (greener) wavelengths. Only the latter groups showed a central tendency shift. Additional groups indicated that a test series that is nominally symmetrical at about 505 nm may be functionally asymmetrical, yielding a central tendency shift toward longer (greener) values. In Exp II, 2 groups of Ss viewed a 495-nm light and were tested with values of 465-505 nm in 5-nm steps. For 1 group, for which E labeled the training stimulus *blue*, a central tendency shift toward shorter wavelengths was observed. The 2nd group, given a *green* label, showed no such shift. —*Journal abstract.*

253. **Tyler, C. William.** (U. Bristol, England) **Induced stereomovement.** *Vision Research*, 1974(Aug), Vol 14(8), 609-613.—Investigated temporal limitations of 3-dimensional shape constancy in 2 Ss by measurement of the perception of movement in an oscillating random-dot stereogram. The departure from shape constancy produced by this stimulus induced apparent movement in the stereoscopic figure. This induced stereomovement was best perceived at low oscillation frequencies. Perception of induced stereomovement differed from perception of monocular movement or previously observed types of stereomovement. (French, German, & Russian summaries) —*Journal abstract.*

254. **Umiltà, C., et al.** (U Bologna, Inst of Psychology, Italy) **Hemispheric differences in the discrimination of line orientation.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 165-174.—Reports results of 3 experiments with a total of 42 normal right-handed male college students. Ss who were trained to discriminate between rectangles oriented with their major axis along the vertical, the horizontal, and the 2 intermediate directions, and presented to the right or left side of a fixation point, exhibited faster discriminative reactions (pressing of a key) to stimuli appearing in the right visual field. In contrast, 2 other groups of Ss performing a similar reaction-time task with

stimuli oriented along other directions (30 and 45° from the vertical to the right and the left; 15, 30, 45, and 60° from the vertical) were faster in discriminating stimuli presented in the left visual field. These differences in performance for the 2 halves of the visual field are attributed to hemispheric differences in the discrimination of line orientation. The opposite hemispheric superiorities found with the different discriminations are attributed to the use of verbal mediators in the discrimination preferred by the left hemisphere, and by the use of a nonverbal strategy in the discriminations preferred by the right hemisphere. (French & German summaries) (30 ref) —*Journal abstract.*

255. **von Hofsten, Claes.** (U Uppsala, Sweden) **Proximal velocity change as a determinant of space perception.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 488-494.—Investigated how and to what degree proximal velocity change determines perceived translatory motion in depth. 2 experiments with a total of 33 Ss used a stimulus consisting of a single dot, moving in a straight horizontal path in a frontoparallel plane. Its motion corresponded to distal depth motion with constant speed. Ss reported verbally what they perceived. Results show that proximal velocity changes of this kind were utilized by the visual system for the perception of the translatory motion in depth. The limits were determined by the absolute rate of change in proximal velocity. Further, it was found that the perceived motion track was usually bent, although all stimuli simulated depth motions along straight paths. —*Journal abstract.*

256. **Vurpillot, Eliane & Taranne, Pierre.** (U Paris V—René Descartes, Lab of Experimental & Comparative Psychology, France) **Judging the identity or nonidentity of drawings, and oculomotor exploration in children 5-7 yrs old.** (Fren) *Année Psychologique*, 1974, Vol 74(1), 79-100.—Recorded in scanpaths children's oculomotor activity in judging the similarity of 2 drawings of houses. When the houses were identical, groups of Ss did not differ and 2/3 of the eye movements were horizontal. When houses differed, the proportion of horizontal movements was significantly lower in the 2nd group. Visual scanning and rules of judgment seem to be related; however, no strategy of paired comparisons (eye movements relating corresponding windows on both houses) appeared in either group. The interaction of several factors is discussed: dominance of the horizontal axis, direction of comparison, arrangement of windows along orthogonal axes, distribution of identical contents between homologous and nonhomologous windows, and rules of judgment.—*G. Rubin-Rabson.*

257. **Wallace, Benjamin & Anstadt, Scott P.** (Western Illinois U) **Target location aftereffects for various age groups.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 175-177.—Reports a study in which no significant difference was found in visual adaptation of prismatic viewing as a function of Ss' age (6-, 11-, and 18 yrs). However, magnitude of adaptation for peripherally located targets during prism exposure was significantly greater compared to more centrally located targets.

258. **Whittle, Paul & Swanston, M. T.** (Psychological Lab, Cambridge, England) **Luminance discrimination of separated flashes: The effect of background luminance and the shapes of T.V.I. curves.** *Vision Research*,

1974(Aug), Vol 14(8), 713-723.—Measured luminance difference thresholds between 2 simultaneous spatially separated monocular 40-msec flashes presented to 2 Ss both in the dark and on a bright background. Weber's Law held approximately from detection threshold to the highest luminances used. The difference threshold was almost unaffected (in fact, slightly lowered) by the background, showing that Weber's Law applied to the incremental luminance, not to the total luminance of flash plus background. It is argued that the shapes of threshold vs intensity curves for detection of a stimulus transient and for discrimination between 2 transients are systematically different. (French, German, & Russian summaries) (19 ref)—*Journal abstract*.

259. Willemssen, Eleanor W. (U Santa Clara) **Judgment of the vertical as a function of stimulus characteristics, age, and sex.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1344.—Presented 5 stimulus displays, which varied in the degree to which straight-line characteristics were present and inconsistent with the correct representation of the vertical, to 24 1st and 24 3rd graders. Most Ss were able to represent the vertical accurately; there were no significant effects due to sex, age, or stimulus characteristics.

260. Woo, G. C. (U Waterloo, School of Optometry, Ontario, Canada) **Temporal tolerance of the foveal size of Panum's area.** *Vision Research*, 1974(Aug), Vol 14(8), 633-636.—Determined that the critical delay time between 2 stimuli of 10-msec exposure time without affecting the size of Panum's area was between 30 and 40 msec for 1 S. It is suggested that the reduction in size beyond the critical delay time may be due to the detection of a misalignment of the test targets based on temporal factors, and that it may indicate a temporal, as well as spatial, tolerance. (French, German, & Russian summaries)

261. Young, Rockefeller S.; Cole, Robert E. & Diamond, A. Leonard. (U Hawaii) **Effects of steady inducer and test duration on threshold.** *Journal of the Optical Society of America*, 1974(Aug), Vol 64(8), 1145-1147.—Determined the threshold energy of 3 experienced adults for a test flash in the presence of an adjacent steady inducer. The effects of different test durations on the inducer's ability to raise threshold was investigated. Changes of test duration from 12.5 to 1,000 msec accounted for a 60% increase of inducer effectiveness at the closest test-inducer separation (8.6'). Increases of separation to 190' produced decrements of this test-duration effect. Results are discussed in terms of test duration as a variable of perceived contrast and possible underlying mechanisms. (21 ref)—*Journal abstract*.

### Motor Processes & Performance

262. Appelle, Stuart & Oswald, Lawrence E. (State University Coll New York, Brockport) **Simple reaction time as a function of alertness and prior mental activity.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1263-1268.—Measured simple reaction time to light onset before and after 20-min periods of differing mental activity. The Ss, who were 30 undergraduates (15 of whom were experienced in transcendental meditation), either "rested" during this period, sorted 9-digit printed

figures into numerical order, or practiced a previously learned meditation technique. Mean reaction times were significantly different following the rest condition and sorting task, but meditators showed no change in reaction time after meditation. However, their scores were significantly faster than those of the other groups, and within-S variance decreased significantly after meditation. Results are discussed in terms of the relationship between reaction time and alertness. (17 ref)—*Journal abstract*.

263. Ariel, Gideon. (U Massachusetts, School of Physical Education, Amherst) **Method for biomechanical analysis of human performance.** *Research Quarterly*, 1974(Mar), Vol 45(1), 72-79.—Describes a quantitative method of analyzing human motion through the use of slow-motion cinematography, special tracing equipment to convert the data, and a high-speed computer. Programing results in a segmental breakdown of information about the whole motion including total body center of gravity, segment velocities and accelerations, horizontal, vertical, and resultant forces, moments of force, and the timing between body segments.

264. Babkoff, Harvey; Bergman, Yehuda & Brandeis, Rachel. (Bar-Ilan U, Ramat-Gan, Israel) **Response probability and response latency to threshold electrocutaneous stimuli.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 417-424.—Conducted 2 experiments to compare 2 measures of somatosensory sensitivity, response probability and reaction time (RT) to electrocutaneous constant current pulses of 350-microsec duration. The psychometric functions were steeper than those obtained for other sensory modalities. Similarly, the RT-intensity functions were also steeper than those obtained in other modalities (i.e., larger decreases in RT as a function of small increases in stimulus intensity). 6 Ss exposed to a broad stimulus range, including high intensities, yielded psychometric and RT functions displaced into a higher intensity region than when they were exposed to a narrow low-intensity range of stimuli. Data are discussed in terms of a decision-theory model of RT. (32 ref)—*Journal abstract*.

265. Berent, Stanley. (U Virginia, Medical Ctr, Perceptual Studies Lab) **Field-dependence and performance on a writing task.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 651-658.—Obtained timed writing samples from 50 female psychiatric inpatients. Patients were assigned, on the basis of their scores on the rod-and-frame test, to extreme field-dependent and field-independent groups. Field-dependent Ss took significantly longer than field-independent Ss to complete the writing task, the field-dependent writing was judged by 3 independent writers to be less legible, less well oriented on the page, less neat, and generally poorer in overall quality than the field-independent writing. Findings are discussed in terms of possible dominant (left) cerebral hemisphere involvement in field-dependence.—*Journal abstract*.

266. Foster, Larry E. & Ellis, Michael J. (Howard U) **Strategies of children during performance of a self-paced activity.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1211-1217.—Studied whether children, when performing self-paced work, would stop to rest rather than slow the work rate, as has been demonstrated in

adults. 6 9-10 yr old boys were tested individually for 4 testing periods during a self-paced bicycle ergometer ride. 8 characteristics of self-paced activity were computed and analyzed for each testing period to determine the stability of their strategies for accomplishing a fixed quality of work. Results show that the total ride time and rate were held relatively constant with an increase or decrease in the number of stops and/or the total stopping time.—*Journal abstract.*

267. Gutin, Bernard; Fogle, R. Keith; Meyer, James & Jaeger, Margaret. (Teachers Coll, Columbia U) **Steadiness as a function of prior exercise.** *Journal of Motor Behavior*, 1974(Jun), Vol 6(2), 69-76.—Studied the effect of exercise on arm and hand steadiness in 2 experiments with male college students. Steadiness was markedly affected by preliminary exercise which raised the activation level, with unsteadiness being greatest at the highest levels of activation.

268. Hines, Dwight; Martindale, Colin & Schulze, Sharon. (U Maine) **Lateral body sensitivity and lateral eye-movements.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1293-1294.—Data from 22 male undergraduates show that lateral eye movements elicited by reflective questions were correlated with a paper-and-pencil measure of lateral body sensitivity and that induced heightened awareness of one side of the body was associated with more eye movements toward that side.

269. Howard, Ian P. & Anstis, Tania. (York U, Toronto, Ontario, Canada) **Muscular and joint-receptor components in postural persistence.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 167-170.—Notes that if a blindfolded person maintains a limb in an asymmetrical posture for some time, he typically misplaces it in the direction of previous asymmetry when he attempts to restore it to a symmetrical position. This effect has been called "postural persistence," and may be due to adaptation in joint receptors or to muscular factors such as those involved in postcontraction. Previous attempts to resolve this issue are considered to be inadequate. In the present study with 12 undergraduates, the aftereffects of holding the head to 1 side were compared with the aftereffects of holding it straight while straining against a torque. Aftereffects in the felt position of the head were evident in only the former condition and were reduced when the head was in the opposite direction to that in which it was adapted. It is concluded that postural persistence is a function of adaptation in joint receptors, at least for moderate loads.—*Journal abstract.*

270. Kantowitz, Barry H. & Knight, James L. (Purdue U.) **Testing tapping time-sharing.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 331-336.—Combined a Fitts's law tapping-task with a serial digit-naming task having 4 levels of stimulus-response complexity in a study with 14 undergraduates. Baseline data were also established for tapping and naming tasks performed singly. In simultaneous-task performance, an increase from 3.9 to 10 bits/sec required by the tapping task was accompanied by a decrease in performance on the naming task. When single- and simultaneous-task performance were both analyzed, an interaction between tapping and naming was obtained, supporting a limited-

capacity channel. However, when only simultaneous-task performance was evaluated, effects of tapping and naming were additive, supporting a stage model of information processing. Results stress the processing demands of a response execution and control stage. (19 ref)—*Journal abstract.*

271. Monty, Richard A. **An interdisciplinary directory of scientists engaged in the study of eye movements.** *US Army Human Engineering Laboratory Report*, 1974(May), 13 p.—Includes names, addresses, phone numbers, educational background, and interests of approximately 100 scientists involved or interested in the study of eye movements and related processes. Entries were made on a voluntary basis, and a form is enclosed for those who wish to be included in subsequent editions.

272. Newell, K. M. & Wade, M. G. (U Illinois, Children's Research Ctr, Motor Performance & Play Research Lab) **Stabilometer trial length as a function of performance.** *Research Quarterly*, 1974(Mar), Vol 45(1), 16-20.—Reduced the response strategies available for stabilometer performance by modifying the trial length to a direct function of S's (each of 24 undergraduates) time in balance. Trials consisted of the amount of time that S could maintain the board in a state of balance; 60 trials were performed by each S. Results show that all Ss improved their performance up to about the 45th trial and there were no significant sex differences in performance. It is concluded that the stabilometer, with trial length as a function of performance, has useful applications to the study of gross motor learning.—*L. Gorsey.*

273. Paulus, Paul B. & Cornelius, William L. (U Texas, Arlington) **An analysis of gymnastic performance under conditions of practice and spectator observation.** *Research Quarterly*, 1974(Mar), Vol 45(1), 56-63.—After initially practicing a gymnastic routine in the presence of 17 coactors and casual spectators, 45 students in a gymnastic class were asked to perform the routine either alone or in the presence of 17 spectators from another class. One group of Ss who performed in front of spectators was given a prior warning of the impending spectator observation, while another group was given no warning. Although Ss in all 3 conditions tended to perform more poorly during the 2nd session, in the 2 spectator conditions the more highly skilled Ss showed greater decrements in performance than the relatively less skilled Ss. This effect was greater in the warning condition than in the no-warning condition. (16 ref)—*Journal abstract.*

274. Rummel, Rose M. (Madison Coll) **Electromyographic analysis of patterns used to reproduce muscular tension.** *Research Quarterly*, 1974(Mar), Vol 45(1), 64-71.—Determined whether individuals who are more accurate in muscular force reproduction have certain electromyographic pattern characteristics which would distinguish them from individuals who are less accurate reproducers. Ss were 90 17-34 yr old males. Pattern characteristics measured included rate of muscle action potential production, variability in rate of muscle action potential production, and amount of intertrial muscle action potential activity. Results show that (a) more accurate individuals produce a significantly lower rate of muscle action potential production; (b) more accurate

individuals are significantly more variable in rate of muscle action potential production; (c) the degree of relaxation between trials is not related to success in reproducing the standard task; and (d) as accuracy increases, muscle action potential characteristics of rate and variability in rate of production follow different trends.—*Journal abstract.*

275. Walters, Clarence P. & Walk, Richard D. (George Mason U) **Visual placing by human infants.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 34-40.—Prior research has not agreed that extension of the arms by the human infant on approach to a surface is a visual response. In this research, 15 8-11 mo old infants extended their arms on approach to a patterned surface covered with glass. The arms did not extend to a patterned surface 14 in below the glass. Thus, the response was a visual, not a vestibular, proprioceptive one. Ambiguity of the visual stimulus that elicits the response is shown by the finding that the infants also extended their arms almost as much to a gray surface just beneath the glass as they did to the patterned one. (25 ref)—*Journal abstract.*

276. Weiten, Wayne & Etaugh, Claire. (Lincoln Land Community Coll) **Lateral eye-movement as a function of cognitive mode, question sequence, and sex of subject.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 439-444.—Verbal and numerical questions elicited significantly more lateral eye-movements to the right than did spatial and musical questions for 48 college students. These results are consistent with the hypothesis that lateral eye-movement is related to the functional organization of the cerebral hemispheres. Contrary to expectations, asking the questions in homogeneous sets as opposed to a mixed list did not produce more eye-movements in the predicted direction for each cognitive mode. Males tended to make more right-movements than females on all 4 types of questions. (15 ref)—*Journal abstract.*

277. Zenhausern, Robert; Pompo, Claude & Cialola, Michael. (St John's U, Jamaica, NY) **Simple and complex reaction time as a function of subliminal and supraliminal accessory stimulation.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 417-418.—Tested simple and complex reaction time to visual stimuli of 24 Ss under 7 levels of accessory stimulation (white noise). Only the highest level of stimulation (70 db above threshold) lowered reaction time. The other levels had no effect.—*Journal abstract.*

## COGNITIVE PROCESSES AND MOTIVATION

278. Anderson, Eugene D. (East Tennessee State U) **The differential use of suggestions with children: A comparative analysis.** *Journal of the American Institute of Hypnosis*, 1973(Jul), Vol 14(4), 169-171, 182.—Investigated the differential affects of positive suggestions (e.g., "do stay in the yard") and counternegative suggestions which stimulate the receiver to react in an inappropriate manner (e.g., "don't leave the yard"), with 27 2nd graders as Ss. All Ss closed their eyes and heard 4 nonaction-oriented suggestions (e.g., "think of an elephant") and 6 action-oriented suggestions (e.g., "spill the

milk"). Each suggestion was prefaced by the word "don't" for experimental Ss and by the word "do" for controls. Ss then drew the visual image evoked by the nonaction-oriented suggestions and pointed to pictures representing the behavior in the action-oriented suggestions. Results reveal that in 5 of the 10 suggestions Ss reflected the key concept or behavior regardless of whether the suggestion was preceded by "do" or "don't," partially supporting the hypothesis that the counternegative suggestion of "don't" may have the same effect as "do" to a child. Implications for hypnotic research and child therapy are briefly discussed.—*A. Olson.*

279. Fitch, Stanley K. (El Camino Coll) **Insights into human behavior.** (2nd ed). Boston, MA: Holbrook, 1974. xvi, 528 p.—Stresses the importance of the unconscious in human behavior and the correlation between the behavior of lower animals and that of man. Discussions on perception, alternate marriage styles, the family of the future, and deviant behavior have been added to the material in the 1st edition.

280. Glass, Arnold L.; Holyoak, Keith J. & O'Dell, Carla. (Stanford U) **Production frequency and the verification of quantified statements.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol 13(3), 237-254.—In Exp I 50 undergraduates were required to generate nouns and adjectives which formed true completions of sentences of the form (Quantifier) S are . . . . The quantifiers used were *All, Many, Some, Few,* and *No*. 3 further experiments with an additional 50 Ss examined the effect of production frequency of the predicate on verification reaction time (RT) for quantified statements. True sentences lower-class category (Exp II) or property (Exp III and IV) predicates were verified more quickly than those with low-frequency predicates when the quantifier was *All, Many, Some,* or *Few*; this difference reversed for *No*-statements. False RT Corps fastest in all cases when the false sentence was semantically anomalous; but in Exp IV, when degree of relatedness of subject and predicate words was varied within false but meaningful sentences, statements with high-related predicates were rejected more quickly. In general, the effect of semantic relatedness reversed for negative (*Few* and *No*) as opposed to positive quantifiers. An ordered attribute-search model is proposed to account for Ss' performance during both predicate production and sentence verification. (22 ref)—*Journal abstract.*

281. Hintzman, Douglas L. (U Oregon) **Theoretical implications of the spacing effect.** In R. L. Solso (Ed). *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Discusses various theories of the spacing effect (i.e., the spacing of learning trials or repetitions facilitates performance), including consolidation, rehearsal, voluntary attention, habituation, and encoding variability hypotheses. The habituation hypothesis appears to be most promising and is in need of further study, although modifications of the other theories also should be investigated. (50 ref)

282. Kinsbourne, Marcel. (Duke U) **Direction of gaze and distribution of cerebral thought processes.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 279-281.—A review of the literature indicates that during verbal thought Ss look

to the right, and during spatial thought they look up and to the left. This effect is weakened or abolished if Ss are asked to hold central fixation, if they are confronted by an E or by the sound of his voice, or if they are set to respond other than straight ahead. If precautions are taken in these respects, the phenomenon is a useful index of cerebral lateralization of cognitive function. (French & German summaries) (33 ref)—*Journal abstract*.

283. **Leuner, Hanscarl**. (U Gottingen, Psychiatric Clinic, W Germany) [**Creativity and "modification of the consciousness."**] (Germ) *Confinia Psychiatrica*, 1973, Vol 16(3-4), 141-158.—Proposes that methods which modify the state of consciousness (e.g., hypnagogic, meditative, or psychotoxic methods) in order to encourage creativity have shown promise. In certain phases of the creative process, stimulation through artificial alteration of consciousness is possible. Broad systematic research is considered essential to confirm and clarify the data. It is suggested that the creative process in the plastic arts occupies a special place. The phenomena of regression, which make it possible to draw upon the vast reservoir of the unconscious, precede very closely the work of artistic-stylistic and epicritic elaboration which characterizes the communication phase of the creative act. States of altered consciousness, therefore, can do no more than facilitate the gathering of new material.—*Journal abstract*.

284. **Masters, Robert**. (Foundation for Mind Research, Pomona, NY) **Consciousness and extra-ordinary phenomena**. *Journal of Altered States of Consciousness*, 1974(Spr), Vol 1(2), 153-167.—Describes 2 cases in which extra-ordinary phenomena appear to have been elicited within the context of altered states of consciousness (trance) in a laboratory setting. In the 1st case, the S was given prolonged and elaborate training as a trance S, including experiencing of trances of several days' duration. The S then was able to repeatedly demonstrate telepathic functioning, as have a few other Ss who were participants in a similar training program. In the 2nd case the S, over a period of more than 6 mo, experienced herself as receiving training in "magic" from an Egyptian deity, the goddess Sekhmet. Her experiences related in terms of the possible activation of an archetype, and it is suggested that those experiences are analogous to ones described by such historical visionary mystics as Swedenborg and Ibn 'Arabi.—*Journal abstract*.

285. **Metzler, Jacqueline & Shepard, Roger N.** (Harvard U) **Transformational studies of the internal representation of three-dimensional objects**. In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Presents a report of 2 experiments, a review of the literature, and a discussion of the theoretical implications of the theory of mental rotation. Data from graduate students who determined whether 2 perspective drawings had the same 3-dimensional shape indicate that the time required to complete the mental rotation process (a) increases linearly with the angle of rotation, (b) is bimodally distributed for angles over 180°, and (c) can be completed in advance of the presentation of the 2nd stimulus, assuming that S already knows the axis and direction of the required rotation. (65 ref)

286. **Nosal, Czeslaw S.** (Technical U, Wroclaw, Poland) **Dynamics of problem solving and cognitive abilities**. *Polish Psychological Bulletin*, 1974, Vol. 5(1), 11-15.—Attempted to demonstrate the interdependence of problem-solving dynamics and cognitive abilities. 70 18-28 yr old Ss were administered tasks assessing the cognitive dimensions of flexibility of perceptual set, speed of coding, and formation of classes, and measuring perceptual, symbolic, and semantic problem-solving abilities. Results show that (a) the perceptual problem-solving rate depended on efficiency in information manipulation (i.e., speed of coding) and information reduction, suggesting that the reduction of information caused the manipulation efficiency to decrease, and that there was a critical rate at which reduction was feasible; (b) only efficiency in information reduction (i.e., formation of classes) was significantly correlated with the rate of symbolic problem solving; and (c) semantic problem solving required a greater flexibility of set rather than a speed of information manipulation.—*L. Gorsev*.

287. **Nystedt, Lars**. (U Stockholm, Psychological Lab, Sweden) **Consensus among judges as a function of amount of information**. *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 91-101.—Attempted to determine whether the amount and kind of information available affect the consensus among judges. 2 experiments were performed, where the consensus was analyzed by the lens model equation, which has been related to the noncriterion situation by Naylor and Schenck (1966). The amount of information available (2, 4, and 6 tests) affected the consensus, but the type of information available (access to the validities of the tests and their intercorrelations) did not have a significant effect. Results imply that consensus among pairs of judges decreases when the number of tests increases. However, in one experiment the difference between 4 and 6 tests was not significant. The change in consensus as the number of tests increased was mainly a function of a decreased matching between a pair of judges with respect to the linear aspects of their judgment processes. Further analysis of the linear aspects of the judges' judgment processes indicated that policy similarity contributed more to consensus than policy consistency. The contribution of the nonlinear aspects of the judgment process to consensus was negligible.—*Journal abstract*.

288. **Richard, Jean F.** (U Paris VIII, Lab of Psychology, France) [**Mediation phenomena and mediational interpretations: I. Problems under discussion**]. (Fren) *Année Psychologique*, 1974, Vol 74(1), 239-268.—Offers 2 interpretations of the term "mediation": (a) a class of phenomena characterized by experimental designs in which an element, stimulus, or response has an intermediary position and can be considered responsible for the transfer of a reaction from 1 stimulus to another; and (b) a certain type of interpretation of these phenomena. Mediation in the learning process assumes 2 relationships: one between the stimulus and the mediator, one between the mediator and the response. A number of problems currently under discussion are reviewed. These include questions as to the conditions favorable to the appearance of mediation phenomena, the factors influencing the phenomena, at what phases of

learning and experiment does the mediation effect intervene, the influence of associative relationships and semantic similarity on mediation, and the role of the mediating response in the equivalence schema. (96 ref)—G. Rubin-Rabson.

289. Savin, Harris B. (U Pennsylvania) **Meanings and concepts: A review of Jerold J. Katz's semantic theory.** *Cognition*, 1973, Vol 2(2), 213-238.—Examines the relationship between the semantics of J. J. Katz and cognitive psychology. The area of semantic concern, semantic theory, selection restrictions and syncategorematicity, semantic theory and language usage, meaning and reference, psychological verbs and the reification of meaning, and meaning and concepts are discussed. While the incompleteness of Katz's theory is acknowledged, it is suggested that it constitutes the only systematic attempt to order the large variety of concepts confronting the cognitive psychologist. (15 ref)—S. Knapp.

290. Slak, Stefan & Hirsch, Kenneth A. (U. Toledo) **Human ability to randomize sequences as a function of information per item.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 29-30.—Asked 16 randomly selected undergraduates to produce a random sequence of binary and ternary numbers in a counterbalanced within-S design. For each S and each condition, relative redundancy up to the 5th order was determined. Relative redundancy increased as a function of order of redundancy estimate significantly faster in the ternary-digit condition. It is concluded that it is more difficult to randomize items containing greater amounts of information.—*Journal abstract.*

292. Stachowski, Ryszard. (Mickiewicz U, Inst of Psychology, Poznań, Poland) **Effect of predecisional information integration strategy on cognitive conservatism.** *Polish Psychological Bulletin*, 1974, Vol 5(1), 17-23.—Tested the hypothesis that cognitive conservatism results from S's consistent modification of the prior subjective probability of a hypothesis by the same increment of subjective probability, regardless of the value of received information (i.e., the strategy of additive probabilities). 10 undergraduates participated in a probability estimation task which contained 5 levels of information value and 3 levels of prior probability of the hypothesis. Results show that 7 of the 10 Ss used the additive (equal increments) strategy. A quantitative analysis of the responses of the other 3 Ss revealed that only the responses of 1 S could be psychologically substantiated. A comparison of the theoretical and subjective probabilities yielded data to confirm the hypothesis.—*Journal abstract.*

293. Taub, John M. & Berger, Ralph J. (U California, Ctr for Health Services, Neuropsychiatric Inst, Los Angeles) **Acute shifts in the sleep-wakefulness cycle: Effects on performance and mood.** *Psychosomatic Medicine*, 1974(Mar), Vol 36(2), 164-173.—Studied the behavioral and psychological effects of shifting the time when 10 habitual 12-8 AM sleepers (male college students) took their usual 7-8 hrs of sleep. A 5-min E-

paced calculation task, a 30-min auditory vigilance task, and an adjective checklist (ACL) were administered following each of 5 electrophysiologically monitored nights of sleep: a 12-8 AM habitual sleep condition, and 8 PM-4 AM, 10 PM-6 AM, 2-10 AM, and 4 AM-12 PM conditions of shifted sleep. After the conditions of shifted sleep, performance on the vigilance and calculation tasks was significantly impaired, and there was significantly greater negative affect as measured by scores on the ACL scales of Activity, Anxiety, Fatigue, and Friendliness. Total hours spent asleep did not significantly differ between the habitual and shifted sleep conditions and averaged above 7 hrs. There were no consistent patterns of correlation between parameters of sleep physiology and the performance and mood variables. Results indicate that altering the time in the circadian rhythm of habitual sleep is detrimental to performance on perceptual and cognitive tasks and mood. (32 ref)—*Journal abstract.*

294. Warren, Robert E. (Columbia U.) **Norms of restricted color association.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 37-38.—Notes that increasing use of the Stroop Color-Word Test to assess the activation of words in memory requires a pool of words whose color associations are known. To provide such a pool, 100 graduate and undergraduate psychology students were asked to indicate which of 4 common colors (red, blue, yellow, or green) was most closely associated with each of 72 words. Normative response tables of the obtained associations are provided.—*Journal abstract.*

295. White, John. (Inst of Noetic Sciences, Palo Alto, CA) **Considerations for a science of consciousness.** *Journal of Altered States of Consciousness*, 1974(Spring), Vol 1(2), 169-173.—Discusses the importance of constructing a metamodel of consciousness from the various existing models. The problems of terminology and of defining major states of consciousness are considered, and a bibliography representing current theories is presented.

296. Zaleska, Maryla. (National Ctr for Scientific Research, Lab of Social Psychology, U Paris VII, France) **[Influence of the method of presenting chance series on the choice of strategy: I. Hypothetical situations.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 125-144.—Conducted 3 experiments to examine beliefs concerning the best mode of response when predicting random events, and describes the strategy useful in several hypothetical situations, each a variation of the same basic problem: What strategy maximizes the number of X elements drawn with replacement from 2 sets A and B, knowing that A contains  $\frac{1}{2}$  of X elements and  $\frac{1}{2}$  of Y elements while B contains  $\frac{1}{2}$  of X and  $\frac{1}{2}$  of Y? The "rational" strategy, the safest, consists in drawing systematically from set A, since it always contains more X elements. The choice of this strategy depends on several factors, among others, on the extent to which the situation is artificial and unfamiliar. The main obstacle to its use seems to be the difficulty of comprehending the independence of random events. Most people did not consider that the best strategy was to systematically predict the same event, knowing that  $\frac{1}{2}$  of their predictions would be incorrect. Rational strategy seemed

justifiable in choice situations where lack of accuracy appeared more acceptable.—*G. Rubin-Rabson.*

### Learning & Thinking & Conditioning

297. Alevizos, Peter N.; Malloy, Thomas E. & Proctor, Stewart. (Camarillo-UCLA Neuropsychiatric Inst. Research Program, Camarillo, Calif.) **Feedback variables in strategy acquisition: Some implications for behavior therapy.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 514-522.—Using a laboratory analog situation, an experiment was conducted which required 60 undergraduates to (a) identify positive instances of a concept, (b) respond to positive instances in a strategic rather than stereotyped manner, and (c) relate their strategic responses to a conceptual parameter of the identified concept. Independent variables were the locus (pattern) of feedback for correct and/or incorrect responding, and whether the feedback given was of neutral or aversive intensity. The major dependent variable was the number of trials to strategy acquisition. Results show aversive and neutral levels of feedback yield different patterns of acquisition rate across locus of feedback conditions. It is urged that behavior therapists attend to the patient's strategic style of coping with conceptually interpreted events in the environment and that the informational properties of aversive events be carefully considered. (15 ref)—*Journal abstract.*

298. Alworth, Robert M. (Los Angeles Community Coll District, Office of Educational Research & Analysis, CA) **Audiovisual equivalence of stimuli in acquisition of associations at two reading levels.** *Perceptual & Motor Skills*, 1974(Jun), Vol. 38(3, Pt 2), 1271-1274.—Studied the difficulty experienced by retarded readers in acquiring associations between auditory and visual information. 41 above- and 42 below-average 1st- and 2nd-grade readers were presented paired-associate tasks involving (a) simultaneous and delayed stimulus presentation, (b) visual-visual and visual-auditory stimuli, and (c) stimuli in which within-stimulus element sequence was and was not relevant in determining the associated response. Inferior paired-associate learning was noted in below-average readers, delayed-presentation tasks, and sequence-relevant tasks. No significant interactions were noted.—*Journal abstract.*

299. Arbuckle, Tannis Y. (Sir George Williams U, Montreal, Quebec, Canada) **Cue-dependent forgetting in paired-associate learning.** *Journal of Experimental Psychology*, 1974(Jul), Vol. 103(1), 124-130.—Conducted 2 experiments with a total of 124 college students to compare concrete nouns and numbers as retrieval cues for paired associates across 3 recall tests. Ss were given instructions to form unbiased mnemonics, mnemonics biased toward the noun, mnemonics biased toward the number, or control instructions. Forgetting and recovery across tests were cue-dependent in that noun-to-number cue shifts yielded substantial forgetting while number-to-noun shifts yielded substantial recovery. Instructional biases modified appropriately the superiority of noun cues over numbers, although the effect was relatively weak. Factors determining the effectiveness of retrieval cues are discussed.—*Journal abstract.*

300. Bartram, D. J. (U. Hull, England) **The role of visual and semantic codes in object naming.** *Cognitive*

*Psychology*, 1974(Jul), Vol. 6(3), 325-356.—Conducted 3 experiments with a total of 66 undergraduates to investigate the effects of familiarity, practice, and stimulus variability on naming latencies for photographs of objects. Latencies for pictures of objects having the same name decreased most with practice when the same picture was always used to represent a given object (Condition Ps-Ns), less if different views of the same object were used (Condition Pv-Ns), and least if pictures of different objects having the same name were used (Condition Pd-Ns). In all cases, however, the effect of practice was significant. The savings in naming latency associated with practice on Conditions Ps-Ns and Pv-Ns showed almost no transfer to Condition Pd-Ns, even though the same responses were being given before and after transfer. However, practice on Condition Ps-Ns transferred completely to Condition Pv-Ns. Name frequency affected latency in all conditions. The frequency effect decreased slightly with practice. Results are related to several alternative models of the coding processes involved in naming objects. It is concluded that at least 3 types of representation may be necessary: visual codes, nonverbal semantic codes, and name codes. A distinction is made between visual codes that characterize 2-dimensional stimuli and those that characterize 3-dimensional objects. (28 ref)—*Journal abstract.*

301. Beck, Robert C. & Davis, John V. (Wake Forest U.) **Effects of real vs pretend shock on semantic differential judgments and the GSR in some classical conditioning paradigms.** *Journal of Research in Personality*, 1974(Jun), Vol. 8(1), 33-44.—Reports 2 experiments in which a total of 200 undergraduates were shown different color 1-sec lights, one just before the end of a 4-sec unconditioned stimulus (UCS) and the other 10 sec after UCS termination and 25 sec before the next UCS. For some groups the UCS was strong electric shock; for others it was a tone which Ss were instructed to imagine was a strong shock. The primary data were changes in semantic differential ratings of the lights before and after 12 "conditioning" trials. There were no differences among the groups. In a 3rd experiment with 72 male undergraduates, a 6-sec delay conditioned stimulus was used for galvanic skin response conditioning, some Ss receiving actual shock and others pretend shock. Only the former showed conditioning. Results are discussed in terms of a model of experimental demand.—*Journal abstract.*

302. Becker, Reinhold. (U Heidelberg, Psychiatric Clinic, W Germany) **[Magical residues in everyday life? A study on the theory of layers in thinking.]** (Germ) *Confinia Psychiatrica*, 1973, Vol. 16(3-4), 177-200.—Investigates the validity of genetical layer-theories. Starting with everyday language, different degrees of development can be defined which determine the descriptive vocabulary. The thinking-models tested are concluded to be largely prescientific.—*Journal abstract.*

303. Bourne, L. E. (U Colorado) **An inference model for conceptual rule learning.** In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Attempts to describe the cognitive events and processes which occur when human Ss solve rule-learning problems by characterizing S's behavior in

terms of a system of operations performed on information provided by both the problem context and by memory. The classification system for these operations is outlined in terms of perceptual, coding, and inferential processes. Data from 3 recent experiments and suggested lines of empirical study of the theory are presented. (20 ref)

304. Brown, Barbara B. (VA Hosp, Sepulveda, CA) **New mind, new body: Bio-feedback: New directions for the mind.** New York, NY: Harper & Row, 1974. xiii, 464 p. \$9.95.—Discusses research into the phenomenon by which man can learn to control his own biological and mental functioning. Among the studies included are those showing the skin's ability to reveal the mind's unconscious reactions to reality; the control of muscles, heartbeat, bloodpressure, and brainwaves; and the altering of states of consciousness. (30 p ref)

305. Bugelski, B. R. (State U. New York, Buffalo) **The image of mediator in one-trial paired-associate learning: III. Sequential functions in serial lists.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 298-303.—College seniors and 8th graders attempted to learn in 1 trial a serial list of 20 words under imagery and standard instructions. Each word was to be learned as a response to the prior word and a stimulus for the succeeding word. Imagery was greatly superior to nonimagery. 8th graders learned as well as college seniors. In both cases, errors and reports suggest that the images came first and labeling second. Incidental learners with an imagery rating orienting task learned better than verbal learning control Ss. The conception of images as parallel rather than sequential processes is not supported; images appear to operate in both modes. —*Journal abstract.*

306. Cartwright, Rosalind D. (U Illinois, Chicago Circle) **Problem solving: Waking and dreaming.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 451-455.—Investigated whether problem-solving ability is either quantitatively or qualitatively superior following an interval of sleep including dreaming than it is following an equal interval of waking time. 24 college students were tested on matched problems before and after these 2 conditions on 3 problem types: crossword puzzles, Remote Associates Test, and Thematic Apperception Test story completions. These were predicted to show the effects of dreaming in increasing order. Only the story endings changed more following sleep than following an awake period. The direction of the change following waking was toward more successful solutions, and after sleep toward more unsuccessful solutions from the point of view of meeting the heroes' needs. Several interpretations of these findings are considered.—*Journal abstract.*

307. Chapanis, Alphonse & Overbey, Charles M. (Johns Hopkins U) **Studies in interactive communication: III. Effects of similar and dissimilar communication channels and two interchange options on team problem solving.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 343-374.—16 teams of 2 college students each solved 4 credible "real world" problems for which computer systems have been or could be useful. Each of the 4 problems was solved on 4 successive days. A team member sent messages either by voice or by typewriter, and every team was tested with all 4 combinations of the

2 message channels assigned to individual team members. Communication by voice was much more rapid and wordy than communication by typewriter. Giving Ss the freedom to interrupt had no effect on the time required to solve problems, on the number of words used in the solution of problems, or on the rate at which words were communicated. When Ss had the freedom to interrupt, they "packaged" their words differently: they exchanged more messages, messages were shorter, and messages were exchanged with greater frequency per unit time. Practice effects were almost entirely absent. A number of significant differences were attributable to the problems and the jobs assigned to the 2 communicators.—*Journal abstract.*

308. Ciccone, Donald S. & Paul, Hadassah. (Rice U) **An analysis of recognition performance in verbal discrimination learning.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 180-182.—Attempted to generalize A. M. Buchwald's (see PA, Vol 43:11244) explanation of S's performance on a multiple-alternative task to include the 2-alternative verbal discrimination (VD) task. (14 reminder was found to facilitate performance on the VD task when compared to either a response reminder or an informationless test trial.

309. Clifton, Rachel K. (U Massachusetts, Amherst) **Heart rate conditioning in the newborn infant.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 9-21.—Assigned 21 infants to conditioning, random control, and backward conditioning groups. During training trials, the conditioning group received an 8-sec tone as a conditioned stimulus (CS), a 6-sec interstimulus interval, and a 10-sec presentation of glucose via nipple as an unconditioned stimulus (UCS) that overlapped the last 2 sec of tone. The random control group received tones at the same intertrial intervals as the conditioning group, but glucose varied randomly. The backward conditioning group received glucose during the 10 sec immediately preceding tone onset. The response to both CS and UCS during base trials was heart rate (HR) acceleration. The response to tone habituated in all groups, but the acceleration to glucose was maintained throughout conditioning. Although no conditioned response to the tone developed over trials, a large HR deceleration appeared during extinction to the absence of the UCS in the conditioning group only. This deceleration was interpreted as an orienting response to the absence of an expected event. (39 ref)—*Journal abstract.*

310. Davidson, Robert E.; Perry, Sherry A. & Baker, Phoebe K. (U Wisconsin) **Unfamiliar stimulus terms in children's paired-associate learning.** *Journal of Educational Psychology*, 1974(Aug), Vol 66(4), 580-583.—64 3rd-grade pupils learned 10 paired associates with nonsense words serving as stimuli and familiar nouns serving as responses (e.g., *latuk-boat*). 32 Ss looked at concretizing pictures of the paired items and heard sentences or labels only. Sentences without pictured stimuli impaired learning, while sentences with pictures facilitated learning significantly. It is suggested that a sentence serves to assure the triggering of a compound image that unitizes the terms.—*Journal abstract.*

311. Dominowski, Roger L. (U Illinois, Chicago Circle) **How do people discover concepts?** In R. L. Solso

(Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Discusses theories of attribute identification and reports 3 experiments which attempted to obtain information about the solution process by requiring Ss to form hypotheses, give post-task reports, and think aloud within a reception of information paradigm. Data suggest that attention should be focused on S's confidence in his decisions and the influence of positive and negative, correct and error trials on the solution process. (41 ref)

312. Duttry, David K. & McManis, Donald L. (Tacoma Public Schools, WA) **Social reinforcement with adult and peer models in shaping responses by first-grade girls to Piagetian intentionality stories.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1087-1094. —24 1st-grade girls making immature responses to Piagetian intentionality stories were given social reinforcement for matching the mature responses of peer or adult models. 24 matched controls performed with peer or adult partners but received neither social reinforcement nor modeling. Group results show both significant short-term and delayed gains in judgments of intentionality ( $p < .05$ ) for Ss given modeling. Individual results, however, show that 9 of the 24 Ss in the modeling groups failed to make lasting gains, indicating great individual differences in susceptibility to such training effects. —*Journal abstract.*

313. Erickson, James R. (Ohio State U) **A set analysis theory of behavior in formal syllogistic reasoning tasks.** In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Presents a theory of syllogistic reasoning, derived from data from college students, which suggests that Ss draw conclusions from a pair of syllogisms according to a 3-stage process—interpretation of a verbal premise in terms of one of the possible set relations, combination of the set relations to determine the set relationships in the conclusion, and interpretation of this new relationship in a verbal statement. 3 models of the theory were examined; data support the notion that Ss do not examine all possible combinations but choose a particular combination according to certain biases.

314. Farley, Frank H.; Peterson, James M. & Whalen, Thomas J. (U Wisconsin, Madison) **The stimulation-seeking motive: Relationship to conceptual category breadth.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 449-451.—Results of an experiment with undergraduates indicate that there is no reliable relationship between stimulation-seeking motive (as measured by the Sensation-Seeking Scale) and conceptual category breadth, contrary to previous findings. (18 ref)

315. Frederiksen, Lee W. & Peterson, Gerald L. (Ohio U) **Schedule-induced aggression in nursery school children.** *Psychological Record*, 1974(Sum), Vol 24(3), 343-351.—Continuously recorded the frequency and intensity of hitting an automated Bobo doll for 8 female and 8 male 5-yr-old nursery school children receiving pennies for barpressing on a continuous reinforcement-extinction schedule. Hitting was distributed throughout extinction and baseline periods but did not occur during continuous reinforcement. No sex

differences were found. Results parallel data obtained from infrahuman organisms and suggest that schedule-elicited aggression in humans may be viewed as an adjunctive behavior. (15 ref)—*Journal abstract.*

316. Gatchel, Robert J. (U. Texas, Arlington) **Frequency of feedback and learned heart rate control.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 274-283.—Investigated the effects of varying frequency of feedback information on learning to accelerate and decelerate heart rate in 2 experiments with a total of 72 male undergraduates. In Exp I 3 feedback frequencies were assessed: information after every heart beat, every 5 beats, and every 10 beats. All feedback groups were compared with a tracking task control group. Results indicate that for speeding sessions, the feedback groups generated faster rates than the tracking group. In addition, there was a significant linear trend across feedback group performance, with Ss receiving continuous feedback (every beat) showing the fastest rates. During slowing sessions, the feedback groups performed better than tracking controls, again supporting a general feedback effect. However, there were no significant trends across feedback groups, suggesting that, unlike speeding, slowing performance is not finely tuned to information input. Exp II replicated the speeding results, again demonstrating that success at this task varies systematically with frequency of information feedback. (16 ref)—*Journal abstract.*

317. Geis, Mary F. & Winograd, Eugene. (Emory U) **Norms of semantic encoding variability for fifty homographs.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 429-431.—Ss gave word associations to the same set of 50 homographs on 2 occasions separated by either 5 min or 48 hrs. For each homograph, the probability of S's giving, at both tests, word associations that represented the same semantic sense was determined. Values are presented for each homograph.

318. Gholson, Barry & McConville, Kathleen. (Hunter Coll, City U New York) **Effects of stimulus differentiation training upon hypotheses, strategies, and stereotypes in discrimination learning among kindergarten children.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 81-97.—2 groups of 50 kindergarten children received stimulus differentiation training either with feedback (experimental Ss) or without (controls), prior to presentation of a series of discrimination-learning problems using blank-trial probes. Performance of both groups was virtually perfect during differentiation training (less than 1 error/1,000 trials). In transfer, however, experimental Ss solved more problems, generated more consistent hypotheses ( $H$ ) during blank-trial probes, manifested fewer response sets, were more likely to abandon a disconfirmed  $H$ , sampled more locally consistent  $H$ s following errors, and retained a confirmed  $H$  more frequently than control Ss. Experimental Ss also manifested strategy Sys (hypothesis sampling systems), while controls generated only stereotypes. (45 ref)—*Journal abstract.*

319. Gorfain, David S. (New Coll.) **Time release from proactive inhibition as a function of amount of proactive inhibition present.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 201-203.—Explored release from proactive interference (PI) produced by a long

intertrial interval (ITI) to determine whether such release is a function of the level of PI at the time of interpolation of the long ITI. The central question was whether such release can be explained purely on the basis of time tagging or whether additional mechanisms for dissipation of interference are necessary. In an experiment with 36 college students, the Brown-Peterson short-term memory paradigm was used with recognition latency as the dependent variable. Results clearly support the conclusion that the greater the amount of PI present at time of ITI interpolation, the less release obtained. A pure time-tagging notion is not sufficient to account for release from PI over long ITIs.—*Journal abstract.*

320. Greenway, A. P. (U Aberdeen, Scotland) **The ambiguous cue problem and the interfering cue theory.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 35-41.—Examined the modified interfering cue theory by H. J. Fletcher et al (see PA, Vol 43:530) to explain performance in the ambiguous cue problem. 96 8-9 yr old children were trained to acquire response tendencies to the individual cues of this problem. When presented subsequently with the problem, Ss showed marked differences in the number and type of errors made. Results are interpreted as supporting the theory of Fletcher et al. It is suggested that the cues with clear positive or negative values were employed by the Ss to limit or neutralize the interference caused by the ambiguous cue.—*Journal abstract.*

321. Hekmat, Hamid. (U. Wisconsin, Stevens Point) **Three techniques of reinforcement modification: A comparison.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 541-548.—Compared 3 techniques for altering the reinforcement potential of the verbal reinforcer "mmmm-hmmm" using 50 undergraduates. Group I, reinforcement potency attribution, involved pairing semantically induced pleasant images to the verbal reinforcer "mmmm-hmmm"; Group II, reinforcement potency attenuation, involved conditioning negative meaning to "mmmm-hmmm"; Group III received reinforcement potency satiation by repeated exposure to "mmmm-hmmm." Groups IV and V were exposed to a buffer task. Immediately after reinforcement modification, affective self-references were reinforced in a quasi-therapeutic interview with "mmmm-hmmm" serving as a verbal reinforcer for the experimental groups and control Group IV. Control Group V received no reinforcement in verbal conditioning. Reinforcement potency attribution enhanced the pleasant evaluative meaning of "mmmm-hmmm" and subsequently induced the greatest verbal conditioning effect. The attenuation and satiation treatments both reduced the pleasant connotation of "mmmm-hmmm" significantly, resulted in no verbal conditioning effect, and were not significantly different from each other in terms of inducing negative connotations or in promoting verbal conditioning.—*Journal abstract.*

322. Jahnke, John C. (Miami U) **Restrictions on the Ranschburg effect.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 183-185.—Obtained the Ranschburg effect (RE) only when word strings were composed of items drawn from a small stimulus vocabulary (8-10 words); with a slightly larger vocabulary (14 words), marked facilitation of the recall of repeated elements was

observed. This result restricts the generality of the RE and is consistent with the view that concurrent intra- and interserial repetition is necessary to the RE.

323. Johnson, Peder J. & Toppino, Thomas C. (U New Mexico) **Effects of category attention, relative frequency of relevant values, and practice on attribute identification performance.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 160-166.—Presented 51 undergraduates with 4 successive attribute identification problems involving either the conditional rule or its complement—the exclusion rule—under either of 2 levels of relative frequency of relevant values. In all conditions, Ss were allowed to select on each trial whether they would be presented an instance from the positive or negative category, but the particular instance from the selected category was determined by E. Results indicate that Ss initially selected positive instances, regardless of the class of stimuli composing the positive category. This positive focus resulted in inferior performance in the low-frequency conditional group. With practice on successive problems, both high- and low-frequency conditional groups switched to a negative focus, which was accompanied by improved performance in the low-frequency conditional group.—*Journal abstract.*

324. Kanak, N. Jack & Knight, John M. (U. Oklahoma) **The re-pairing decrement in verbal discrimination transfer: Further evidence favoring associative mechanisms.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 304-309.—In a previous study, W. P. Wallace and G. W. Nappe (see PA, Vol 46:261) suggested that the re-pairing decrement in a verbal discrimination (VD) transfer task obtained in 1969 by N. J. Kanak and M. F. Dean could be accounted for by an extension of the counting postulate of frequency theory without involving associative mechanisms. This extension was based on the assumption that the Kanak and Dean re-pairing manipulation produced some pairs in which wrong items were actually higher in situational frequency than right (R) items. The present transfer experiment with 64 undergraduates attempted to rule out this possibility by the use of a familiarization task involving free recall of R items prior to VD learning, thereby increasing the situational frequency of R items prior to List 1 learning and List 2 re-pairing. Relevant familiarization significantly facilitated List 1 learning relative to irrelevant familiarization. Compared to transfer conditions involving corresponding List 1-List 2 pairings, a substantial re-pairing decrement attributed to incidental associative interference was observed in List 2 errors under conditions of both relevant and irrelevant familiarization.—*Journal abstract.*

325. Kee, Daniel W. & Rohwer, William D. (U Southern California) **Response and associative phase components of elaborative prompt effects in children's noun-pair learning.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 62-71.—Separately estimated the effects of aural and pictorial elaborative prompts for response and associative phase components of children's noun-pair learning. A 20-item list of noun pairs was administered individually to 200 2nd- and 3rd-grade children by the method of paired-associates. Indices of response learning (free verbal recall and

pictorial identification) revealed equivalent effects among prompt conditions whereas measures of associative learning (multiple-choice pictorial-recognition tests) demonstrated substantial performance facilitation as a function of both aural and pictorial elaborative prompts. This outcome was regarded as an unequivocal identification of the locus of elaborative prompt effects in children's noun-pair learning.—*Journal abstract.*

326. King, David J. (State University Coll. New York, Oswego) **Total presentation time and trials to criterion in connected discourse learning.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 27-28.—Presents 7 sets of data which summarize the relationship between trials to criterion and total presentation time for a 25-word-long passage of connected discourse. The resultant relationship shows a sharp negative deceleration with trials to criterion becoming quickly asymptotic between 2 and 2½ trials. Implications of this relationship to the total-time hypothesis for connected discourse learning are briefly presented.—*Journal abstract.*

327. Kirkland, John. (U. Missouri) **On boosting divergent thinking scores: The context effect.** *California Journal of Educational Research*, 1974(Mar), Vol. 25(2), 69-72.—Administered to 40 female undergraduates either (a) a test booklet containing convergent thinking items from the Lorge-Thorndike Intelligence Test with instructions emphasizing intelligence or (b) a booklet containing divergent thinking items from the Torrance Tests of Creative Thinking with instructions emphasizing creativity. Scores from Torrance's repeated figures circles test constituted the dependent variables. Results show that the divergent (creativity) Ss produced significantly fewer pictures and integrated them less frequently than did the convergent (intelligence test) Ss, and support the existence of both a context effect and variations in the degree of motivation.—*L. Gorsey.*

328. Klinger, Eric. (U. Minnesota, Div. of Social Sciences, Morris) **Utterances to evaluate steps and control attention distinguish operant from respondent thought while thinking out loud.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 44-45.—Conducted 2 experiments with 24 paid and 6 volunteer male college students, respectively, in which Ss were instructed to think out loud while engaged in solving manual puzzles, solving logic problems, revery, and quasihypnagogic thought. During the manual puzzle and logic problem activity, Ss produced significantly more utterances in which they evaluated their previous problem-solving thoughts or acts and in which they indicated that they were controlling their attention than during revery and hypnagogic thought. Findings are interpreted to support the distinction between operant and respondent thought, and they help to characterize the former. Results carry implications for theory of thinking, response organization, cognitive development, self-regulation, and thinking dysfunctions as in mental fatigue and psychosis.—*Journal abstract.*

329. Lemineur, R. & Meurice, E. **[Is cognitive mediation possible in operant conditioning of spontaneous electrodermal reaction?]** (Fren) *Revue de Psychologie et des Sciences de l'Éducation*, 1973, Vol 8(3), 271-285.—Conducted a 2-part study to investigate operant conditioning of the palmar galvanic skin

response (GSR) of 5 Ss. In each part there were 5 sessions, each having a 10-min learning period and a 10-min detection period. In Part 1, during the learning period, S was given a light signal whenever a GSR occurred. The response was presumably associated with some ideation. During the detection period S pressed a button whenever he believed a GSR had occurred. In Part 2 the learning period was the same as before but in the detection period S was given a signal whenever his belief that a GSR had occurred was correct. It is concluded that Ss can learn to detect GSR activity.—*S. Marzolf.*

330. Lester, David & Miller, Nancy H. (Richard Stockton State Coll) **Sex differences in inhibition on cognitive tasks.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 502.—Conducted 2 experiments, each with 20 male and 20 female undergraduates. Female Ss were superior at tasks involving simple rote memory. No differences were found between the sexes in their ability to inhibit interference responses.—*Author abstract.*

331. Levine, Marvin. (State U New York, Stony Brook) **A transfer hypothesis, whereby learning-to-learn, Einstellung, the PREE, reversal-nonreversal shifts, and other curiosities are elucidated.** In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Proposes a theoretical transfer hypothesis that can be used to explain learning-to-learn, Einstellung, the partial reinforcement extinction effect, and reversal-nonreversal shift effects. The hypothesis stresses that the solution experienced by S during the criterion state of the learning process (i.e., when S holds only the solution) determines the extent of transfer. (24 ref)

332. Martin, Edwin & Norren, David L. (Human Performance Ctr, Ann Arbor, MI) **Serial learning: Identification of subjective subsequences.** *Cognitive Psychology*, 1974(Jul), Vol 6(3), 421-435.—Results of a study with 48 undergraduates demonstrate that learning of fixed arbitrary sequences was accomplished by idiosyncratic subsequencing and assembly of the resulting subsequences. An error item that just preceded a subjective subsequence was a closely constrained member of that subsequence. Identification and characterization of subjective subsequences were accomplished by analyses of forward serial learning, free recall, and backward serial learning. It is concluded that ordinary serial learning cannot be represented by traditional continuous-process theories, but instead must be treated by an organizational model. (17 ref)—*Journal abstract.*

333. McFarland, Carl E. & Kellas, George. (U. Kansas) **Mode of input effects on subject-controlled processes.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 343-350.—72 undergraduates paced themselves through either auditory or visual presentation of 15-item lists. Ss were instructed to either (a) rehearse cumulatively, (b) actively rehearse primacy items while passively attending to recency items (active-passive), or (c) rehearse by choosing their own strategy (free). Study times showed that when no restraints were placed on rehearsal, Ss receiving auditory presentation required longer processing time than did Ss receiving visual presentation. Modality had no effect on correct

responding but did influence the order of recall in the free and active-passive conditions. Results are discussed in terms of a proposed hypothesis concerning interference arising from the similarity between acoustic trace information and the articulatory-acoustic mode for subvocal rehearsal. (18 ref)—*Journal abstract*.

334. Mueller, John H.; Gault, Prentice & Evans, James H. (U Missouri, Columbia) **Stimulus encoding in A-Br transfer.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 54-61.—Studied A-Br transfer in 3 experiments with a total of 120 undergraduates, using groups which differed in their inducements to change functional stimuli. The nominal stimuli were double-solution 5-letter anagrams. In Exp I, Group 1 received 1 solution in parentheses during List 1 and the other solution in parentheses during List 2. Group 2 had either the 1st or last letter of the anagram stimulus highlighted in color, with that switched between Lists 1 and 2. Relative to an A-Br group with no inducement to change encodings, only Group 1 showed reduced negative transfer. However, the presence of cues throughout both lists does not constitute a good test of the encoding variability hypothesis, and Exp II and III indicated no such reduction when the transformational cues were not continuously present. These results do not support the recoding corollary of the encoding variability hypothesis. (19 ref)—*Journal abstract*.

335. Mueller, John H.; Pavur, Edward J. & Yadrick, Robert M. (U. Missouri) **Verbal-discrimination learning as a function of encoding variability.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 41-43.—Manipulated the encoding variability of the right (R) and wrong (W) terms in a verbal-discrimination task repeated in 2 experiments. When the number of different associates defined variability, pairs with low-encoding variability for both R and W terms were learned fastest, followed by pairs with high-encoding variability in both R and W terms. When the number of dictionary meanings defined variability, pairs with high-encoding variability R terms and W terms were learned slower than all other combinations. The outcomes do not correspond to expectations involving only the number of encodings in each component of a pair; it is suggested that the number of nonoverlapping encodings is more important.—*Journal abstract*.

336. Nelson, Douglas L.; Brooks, David H. & Borden, Richard C. (U South Florida) **Effects of formal similarity: Phonetic, graphic, or both?** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 91-96.—Notes that when words are formally similar in a paired-associate list they share graphic as well as phonetic features. 5 experiments were conducted with a total of 400 college students to separate the effects of each type of similarity as a function of both ordinal position of similarity and modality of presentation. When presentation was within the visual mode the results suggested that both graphic and phonetic features were processed at both the initial and terminal positions of the stimulus words. When presented in the auditory mode, only phonetic features were apparently processed.—*Journal abstract*.

337. Nielsen, Gary E. (Community Mental Health Services, Marin County, CA) **Helping children behave: A**

**handbook of applied learning principles.** Chicago, IL: Nelson-Hall, 1974. xi, 170 p. \$8.95.—Presents a simplified handbook for parents and teachers on the use of applied learning principles with normal, retarded, or developmentally disabled children. Basic learning models are described in terms of behavior and consequences, along with the applications of these models to different objectives, case illustrations of behavioral principles, and techniques of facilitating child-parent communication. (25 ref)

338. Nowaczyk, Ronald H.; Shaughnessy, John J. & Zimmerman, Joel. (Miami U) **Proactive interference in short-term retention and the measurement of degree of learning: A new technique.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 45-53.—In 3 experiments, a total of 308 undergraduates were presented with successive free-recall lists to examine proactive interference effects and changes in degree of learning in a short-term retention task. Recall was relatively constant across lists for the immediate recall groups. For the delayed recall groups, recall decreased from 1st to the 2nd list and was relatively constant thereafter. It is suggested that with the technique used it is possible to obtain estimates of the degree of learning of a short-term retention task that are not confounded by ceiling effects. Applications of this technique are discussed with regard to determination of the locus of D. D. Wickens's release from proactive interference effect.—*Journal abstract*.

339. Oziel, L. Jerome & Berwick, Peter T. (U South Carolina) **Effects of feedback on self-reinforcing behavior in relation to self-acceptance.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1039-1044.—A total of 96 high and low self-accepting undergraduates (as measured by the California Personality Inventory—CPI) were divided into 8 treatment groups: (a) a low self-accepting group that received facilitating feedback for self-reinforcing responses, (b) a group comparable to the previous one but which was also given positive feedback on social comparisons, (c) a low group that received inhibiting feedback for negative self-reinforcement responses, and (d) a low self-accepting control group. The remaining 4 groups were Ss high in self-acceptance; they were treated in a comparable fashion to the 1st 4 groups but instead were given feedback designed to decrease their self-reinforcement rate. In addition to the CPI, Ss were given E. M. Berger's measure of self-acceptance and self-ratings of creativity and intelligence before and after treatment. There were few significant changes for the postmeasures following the conditioning treatment. Some hypotheses from past research concerning the relationship between self-reinforcement and self-acceptance are questioned.—*Journal abstract*.

340. Reed, Stephen K.; Ernst, George W. & Banerji, Ranan. (Case Western Reserve U) **The role of analogy in transfer between similar problem states.** *Cognitive Psychology*, 1974(Jul), Vol 6(3), 436-450.—Investigated the effect of transfer between 2 problems having similar (homomorphic) problem states in 3 experiments with a total of 226 undergraduates. Results reveal that although transfer occurred between repetition of the same problems, transfer occurred between the Jealous Husbands problem and the Missionary-Cannibal problem only when (a) Ss were told the relationship between the 2

problems and (b) the Jealous Husbands problem was given first. Results are related to the formal structure of the problem space and to alternative explanations of the use of analogy in problem solving. These include memory for individual moves, memory for general strategies, and practice in applying operators.—*Journal abstract.*

341. Robbins, Donald; Bray, James F. & Irvin, James R. (Emory U) **Intralist contrast effects in cued recall.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 150-155.—Reports on 4 experiments with a total of 145 undergraduates in intralist inhibition effects were investigated in a cued-recall or paired-associate study-test procedure. The inhibition effect occurs when a list of unrelated words contains some words that occur once and some words that occur twice; the recall of words that occur only once is less than that from a comparable list in which all words occur only once. Exp I revealed that this intralist inhibition effect, previously reported in free recall studies, also occurs in a cued-recall task. Exp IV revealed that the effect is not the result of output interference, while Exp II and Exp III revealed that a necessary condition to obtain inhibition is to require Ss to retain frequency information as well as the item itself.—*Journal abstract.*

342. Ross, Bruce M.; Locker, Roger & De Lisi, Richard. (Catholic U of America, Ctr for Research in Thinking & Language) **Deductive problem solving with limited information.** *Center for Research in Thinking & Language Report*, 1974(Mar), No CRTL-TR-1, 36 p.—Used a previously formulated model of deductive reasoning as a basis for designing and analyzing a series of 4 experiments conducted with 151 college students. The formulated problems dealt with both conjunctive and disjunctive concepts and concept instances and with different degrees of concept and instance complexity, generally possessed more than one logically correct solution. 2 experiments required Ss to deduce concepts from lists of instances, while 2 other experiments listed concepts from which Ss deduced instances. In spite of wide individual differences a high level of success (75-80%) was found in 3 of the 4 experiments with a mixture of problems varying in difficulty level. Findings included a greater difficulty for disjunctive vs conjunctive solutions and increased error with a lengthening of the list of instances or concepts. The pertinence of using deductive techniques in relation to decision making and cases of information reduction where deductive processes can assist in solving part of a larger problem are discussed.—*Journal abstract.*

343. Runquist, Peggy A. & Aronson, Gerrit O. (U. Alberta, Edmonton, Canada) **Facilitative and interference effects of response grouping in paired-associate learning.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 363-365.—Conducted 2 experiments with a total of 148 college students to investigate the effect of grouping unrelated response terms on the learning of paired-associate items. In Exp I Ss learned response groupings in a pretask that were either the same as or different from response groupings acquired in the paired-associate task. Results clearly indicate that prior learning of the same response groupings interfered with the learning of specific associations. Exp II manipulated

order of presentation (blocked or nonblocked) of categorizable or noncategorizable items. There was some evidence that response grouping facilitated acquisition performance under blocked presentation but not under nonblocked presentation. The facilitation was attributed to factors that would increase guessing efficiency.—*Journal abstract.*

344. Skinner, Nicholas F. (King's Coll, U Western Ontario, London, Canada) **Comment on Sachs and May's paper on the conditioned emotional response with humans.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1069-1070.—Attempts to explain D. A. Sachs and J. G. May's (see PA, Vol 44:4477) inconsistent finding that the effects of the conditioned emotional response (CER) range from response facilitation to response suppression. It is suggested that to some extent personality characteristics may account for inter-S variability in reactions to the CER contingency.

345. Smallwood, Robert A. & Arnoult, Malcolm D. (Texas Christian U) **A comparison of simple correction and functional feedback in schema learning.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 581-585.—Clarified the role of knowledge of results (KR) in a schematic concept formation task by manipulating the specificity of information provided during feedback. 224 undergraduates learned to discriminate between pairs of random forms from 2 schema families. Verbal correction was compared with a functional KR procedure in which the schema prototypes were superimposed over test stimuli. In no case did verbal correction improve learning in comparison with functional KR. Differences in acquisition persisted in a retention test.—*Journal abstract.*

346. Tondo, Thomas R. & Cautela, Joseph R. (U Mississippi) **Assessment of imagery in covert reinforcement.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1271-1280.—Assigned 28 undergraduates with high or low imagery (as measured by an imagery survey schedule) to high-imagery experimental, low-imagery experimental, high-imagery control, and low-imagery control groups. First, each S was given practice trials in which to imagine and rate the latency, clarity, and pleasantness of a self-selected "pleasant" scene. Next, during a circle size-estimation task, a verbal cue to imagine the scene (covert reinforcement) was made contingent on each overestimate for experimental Ss but not for control Ss. Results indicate that high-imagery experimental Ss showed significantly greater positive change in size-estimation than either low-imagery experimental or high-imagery control Ss. Also, high-imagery Ss rated the scenes significantly lower in latency and higher in clarity and pleasantness of imagery than did the low-imagery Ss. Significant correlations were found for experimental Ss between ratings of pleasantness of scenes and change in size estimation ( $r = .75$ ) and between frequency of scene presentation and change in ratings of pleasantness of scenes ( $r = -.58$ ). Although the findings are interpreted as supporting the need for imagery assessment in covert reinforcement, alternative explanations are also discussed.—*Journal abstract.*

347. Van Duyne, P. C. (State U Groningen, Netherlands) **A short note on Evans' criticism of reasoning experiments and his matching response**

**hypothesis.** *Cognition*, 1973, Vol 2(2), 239-242.—Attempts to reformulate some of the problems in the psychology of reasoning with reference to J. St. B. Evans and J. S. Lynch's (see PA, Vol 51:8371) distinction between logical, illogical, and nonlogical behavior in matching bias in selection tasks. It is argued that their matching hypothesis does not offer any explanation of underlying operational variables. (19 ref)

348. Wilder, Larry; Levin, Joel R.; Kuskowski, Michael & Ghatala, Elizabeth S. (U. Wisconsin, Research & Development Center for Cognitive Learning, Madison) **Pronunciation effects in verbal discrimination learning.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 366-367.—Previous research has found that spoken rehearsal is superior to silent rehearsal during verbal discrimination (VD) learning. Frequency theory can account for this finding if it is assumed that pronunciation leads to an even greater frequency differential between the correct and incorrect item in each pair than occurs in silent performance. Support was found for this assumption in 2 experiments in which an incidental recognition memory task was administered to a total of 80 college students after verbal discrimination learning. Further, in contrast with earlier research, it was found that the increased frequency differential was due at least as much to increased recognition of the previously correct VD items as to decreased recognition of the previously incorrect items.—*Journal abstract.*

349. Wilson, Marian M. (Harvard U, Medical School, Boston) **Novelty as a reinforcer for position learning in children.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 51-61.—Modified the stimulus-familiarization-effect (SFE) paradigm, a reaction-time (RT) task based on a response to novelty procedure, to assess response for novelty (i.e., a response-reinforcement sequence). 96 kindergarten children were familiarized on 1 of 2 colored lights. Ss were confronted with a simple position discrimination task in which they could choose between 2 response buttons which produced either the previously familiarized light or a new (i.e., novel) light. Results show that the choice response for the novel stimulus (NS) was facilitated by 3 variables: number of exposures to and duration of each exposure of the familiar stimulus (FS), and degree of change provided by the NS relative to the FS. The parallel between the effective variables of this study and those which produce the SFE was noted, implicating an attention interpretation of the function of novelty as a reinforcer.—*Journal abstract.*

350. Wolford, George & Hollingsworth, Samuel. (Dartmouth Coll) **Redundancy in the full-report procedure.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 457-458.—Varied redundancy in the tachistoscopic full-report procedure with undergraduates. Unlike previous experiments using the detection paradigm, redundancy led to a detriment in performance. Evidence is presented that response bias was not the cause of the detriment.

351. Woods, Paul J. (Hollins Coll) **A taxonomy of instrumental conditioning.** *American Psychologist*, 1974(Aug), Vol 29(8), 584-597.—Proposes a classification scheme for instrumental conditioning paradigms based on 4 dichotomies: (a) whether the organism is

required to "emit" or "omit" a response, (b) whether a "desirable" or "aversive" stimulus event is made contingent upon the response, (c) whether the operation performed upon this stimulus event is one which "increases" or "decreases" its magnitude or intensity, and (d) whether or not the organism is given any "signal" prior to the response as to the consequent stimulus event. The resulting classification scheme includes 16 distinct paradigms, each of which is illustrated with research examples (when they are known to exist) and with examples from "real-life" situations. The relationship between the present scheme and previous classification attempts is indicated, and a meaningful and consistent nomenclature is proposed.—*Author abstract.*

352. Yuille, John C. (U British Columbia, Vancouver, Canada) **Syntactic facilitation of children's associative learning: An instructional effect.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 41-50.—Reports an experiment with 90 5th graders in which connective recall, as well as noun recall, was obtained in a pair-associate learning, syntactic facilitation paradigm. Differences in the pattern of noun and connective recall, and a partial independence in the 2 types of recall, were obtained. Results are consistent with the hypothesis that E-supplied verb links facilitate noun pair learning by serving an instructional role, indicating to the S how a pair might be coded. (25 ref)—*Journal abstract.*

353. Zenhausern, Robert & Hansen, Karen. (St John's U, Jamaica, NY) **Differential effect of subliminal and supraliminal accessory stimulation on task components in problem-solving.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 375-378.—Studied the effect of subliminal and supraliminal accessory stimulation on the Stencil Design Test, using 35 male graduates and undergraduates as Ss. 30 db below threshold and 35 db above threshold resulted in performance decrement, while 10 db below threshold and 60 db above threshold led to facilitation. Comparison with past research provides evidence that accessory stimulation differentially affects various components of the task.—*Journal abstract.*

### Attention & Memory

354. Arthur, Louise M. & Daniel, Terry C. (U. Arizona) **Effect of picture-word transfer on accuracy and latency of recognition memory.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 211-215.—Investigated temporal parameters of recognition memory for pictures and words in a reaction time experiment with 26 undergraduates. Dark-adapted Ss self-initiated 250-msec exposures of arrays containing 8 different stimuli—either pictorial silhouettes or corresponding block-lettered verbal labels—in the peripheral cells of a 3 × 3 grid. Following every array and a subsequent 3-sec delay interval, a test item—either a 4-letter word or a picture—appeared in the center grid square for 250 msec. By quickly pressing a yes or no button, Ss indicated whether the test item had been present or absent in the preceding array. Each S served under all of the following conditions: word array-word test, picture-picture, picture-word, and word-picture. Order of presentation was completely randomized for each S. Analyses of both accuracy and reaction time data revealed interactions

between mode of presentation, mode of test, and decision strategy. Such results may be partially dependent on ability to form a visual memory image of the array, though further active encoding processes may be responsible for subsequent disruption of that image.—*Journal abstract.*

355. Atkinson, Richard C.; Hermann, Douglas J. & Wescourt, Keith T. (Stanford U) **Search processes in recognition memory.** In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Based on data from experiments on memory scanning with small, large, and duplex target sets and the effects of semantic variables on response time, a mathematical model and a theoretical division of the memory system into a memory storage network and various control processes are proposed. The memory storage network is composed of a sensory register, short-term store, and long-term store, and control processes include selective attention, rehearsal, choice of retrieval cues, and all types of decision strategies. (48 ref)

356. Bartlett, James C. & Tulving, Endel. (Yale U) **Effects of temporal and semantic encoding in immediate recall upon subsequent retrieval.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol 13(3), 297-309.—Conducted 2 experiments with 72 paid college students in each in which Ss heard lists of 6 digit-word pairs. After each list they attempted to recall 1 of the words in response to either a temporal or a semantic cue; after a block of lists recall and recognition of all words were tested. Initially untested words showed a strong negative recency effect in delayed recall and recognition, suggesting that the effect results from encoding processes terminating with the presentation of each list. Delayed recall and recognition of initially tested words was influenced by the mode of initial retrieval only for words from input positions 5 and 6, initial semantic cuing being more effective than temporal cuing. This latter finding is consistent with the view that terminal list items in typical immediate recall tests are retrieved in terms of short-lived nonsemantic information. (20 ref)—*Journal abstract.*

357. Brewer, William F. & Harris, Richard J. (U Illinois) **Memory for deictic elements in sentences.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol 13(3), 321-327.—The deictic elements of a language are the linguistic forms relating the utterance to a particular time, place, speaker, or discourse context. In the present 2 experiments a total of 65 undergraduates memorized sentences containing words from 1 of 5 deictic categories (deictic place adverbs, demonstrative adjectives, articles, deictic verbs, and temporal adverbs). When the sentences were presented in the usual experimental setting in which they are isolated from the actual time, place, person, and discourse context, the deictic words were much more difficult to remember than the nondeictic words. In sentences with appropriate context the deictic words were little different from the nondeictic words. Results support the hypothesis that deictic elements have limited meaning in sentences without deictic context and are therefore hard to remember.—*Journal abstract.*

358. Davenport, William G. (U British Columbia, Vancouver, Canada) **Arousal theory and vigilance: Schedules for background stimulation.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 51-59.—Assessed the effect on an O's monitoring efficiency in a visual vigilance task of having 1 of 4 irrelevant background music schedules (continuous music, music under a fixed interval temporal schedule, music under a variable interval temporal schedule, or music under a random interval temporal schedule) present during the watch. Ss were 48 college students. Results show significantly different correct detection rates and response latencies for signals presented under the different background schedules. The random interval background was superior, followed closely by the variable interval background; the other 2 schedules were similar and much less effective. Some differential results were obtained for males and females. Results are interpreted as generally favoring the arousal theory of vigilance. (18 ref)—*Journal abstract.*

359. Ehri, Linnea C. & Muzio, Irene M. (U California, Davis) **The influence of verb meanings on memory for adjectives.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol 13(3), 265-271.—College students were told either to form images (Exp I, 46 Ss) or to learn sentences (Exp II, 63 Ss). A noun-prompted sentence recall task exposed Ss' memory for adjectives modifying either subject or object nouns. Results reveal that subject modifiers were better remembered than object modifiers. Also, adjectives semantically unrelated to verbs were recalled better than adjectives related to verbs. For object modifiers, this appeared to occur because Ss tended to omit adjectives from their productions when verbs imposed these attributes upon the nouns modified. Constructive, interpretative, and associative theories of semantic memory are applied to the results. (19 ref)—*Journal abstract.*

360. Eysenck, Michael W. (Birkbeck Coll, U London, England) **Extraversion, arousal, and retrieval from semantic memory.** *Journal of Personality*, 1974(Jun), Vol 42(2), 319-331.—Assigned 51 18-30 yr old undergraduates to 1 of 4 groups based on scores on the Extraversion scale of the Eysenck Personality Inventory and on the General Activation factor of Thayer's Activation-Deactivation Adjective Check List. Ss were required to name items from 5 conceptually unrelated categories for 12 min. Extraverts produced significantly more items than introverts, but this was qualified by a significant Extraversion  $\times$  General Activation interaction, indicating that high General Activation enhanced performance for extraverts but reduced it for introverts. Organization of output was a relevant factor in explaining some intergroup differences. Intergroup differences were greater for the interword response times (IRT) occurring within a conceptual category than for IRTs occurring at the transition between categories. A continuity between semantic memory and categorized free recall is suggested. (32 ref)—*Journal summary.*

361. Fischhoff, Baruch & Beyth, Ruth. "I knew it would happen"—Remembered probabilities of once-future things. Eugene, OR: Oregon Research Inst, Research Bulletin Vol 14(4), 1974. 22 p.—Ss who were

asked to recall, some time after the events, the predictions they had made of the likelihood of possible outcomes of presidential trips abroad before they had occurred, demonstrated remembered-reconstructed probabilities which were higher than those originally assigned for events believed to have occurred. Cognitive "anchoring" and possible detrimental effects of feedback are discussed.

362. Foos, Paul W. & Smith, Kirk H. (Bowling Green State U) **Effects of spacing and spacing patterns in free recall.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 112-116.—Examined the effects on free recall of presenting words twice with different numbers of intervening items (spacings) and 3 times with different amounts and patterns of spacing. Ss were 120 undergraduates. Over all conditions and with position of last occurrence held constant, the beneficial effect of spacing increased with spacing (defined for each pair of repetitions rather than averaged) up to at most 8 intervening items, and then declined. The results are therefore consistent with R. C. Atkinson and R. M. Shiffrin's 1968 explanation of the spacing effect in terms of overlap in short-term storage. Recall of items presented 3 times also suggested that use of mean spacing values for items presented more than twice tends to obscure spacing effects.—*Journal abstract*.

363. Forsyth, G. Alfred & Shor, Ronald E. (U New Hampshire) **An individual differences analysis of interdimensional additivity in multidimensional scaling.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 563-567.—Obtained comparative judgments of the dissimilarity between schematic faces varying on 1, 4, 7, or 10 binary attributes. Using L. R. Tucker and S. Messick's (see PA, Vol 38:4865) procedure, 3 subgroups of 10 like-perceiving undergraduates each were isolated, and the nature of cue-utilization by each was described. Perceptual independence of attributes was demonstrated both within and between instructional sets for Subgroup 1 and within instructional sets for Subgroup 2. The Subgroup-3 results indicate an interaction of the attributes. Data from the Shor Cognitive Elements Test differentially characterized Subgroups 1 and 2, but did not uniquely characterize Ss requiring more complex models for the combination of attributes. The study illustrates the possible usefulness of an individual differences approach to the study of selective attention and information processing. (21 ref)—*Journal abstract*.

364. Fraisse, Paul. (U Paris V—René Descartes, Lab of Experimental & Comparative Psychology, France) **[The influence of length of presentation on recall of drawings and sentences.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 145-156.—Tested the hypothesis that the superiority of memory for drawings over memory for sentences is due to double (visual and verbal) coding of concrete material. A series of drawings with 2 related elements and a series of sentences describing the drawings constituted the material. To hinder or facilitate verbalization of drawing content, the interval between stimuli was varied from  $\frac{1}{2}$  sec to  $1\frac{1}{2}$  sec. After a single presentation, S evoked the items in free recall. When the interstimulus interval was too brief (less than 500 msec) for a verbal coding to be possible, memory for drawings was no better than memory for sentences. There was a

100% increase in memory for drawings when the interstimulus interval was increased, while the corresponding increase of memory for sentences was only 20%. Results are comparable when recall is delayed. The hypothesis is sustained, even when verbalization of drawings is complex.—G. Rubin-Rabson.

365. Gardiner, John M.; Thompson, Charles P. & Maskarinec, Ann S. (City U, London, England) **Negative recency in initial free recall.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 71-78.—Conducted 3 experiments with a total of 139 college students to test the prediction of 2-memory theories that it should be possible to produce negative recency in initial recall. Exp I provided a demonstration of this negative recency effect, contrary to previous findings. 2 additional experiments were performed to resolve the contradiction between previous and present results. At the procedural level, the data show an interaction between (*Ma*) and Psychasthenia (*Pt*) scales of the to-be-remembered items and the type of interpolated task. At the theoretical level, the data suggest modality-specific storage in primary memory. (16 ref)—*Journal abstract*.

366. Glidden, Laraine M. & Roemer, Joan M. (Teachers Coll. Columbia U) **Meaningfulness, formal similarity and subjective organization.** *Psychological Record*, 1974(Sum), Vol 24(3), 399-408.—Conducted 2 experiments with 44 and 72 undergraduates, respectively, which manipulated meaningfulness (M) and formal similarity (FS) in a multitrial free-recall task. Both accuracy and unidirectional and bidirectional subjective organization (SO) were measured. M facilitated both recall and SO but had a greater effect on bidirectional than unidirectional SO. Low FS lists resulted in higher recall and SO scores than did high FS lists, probably because of greater item discriminability. Data are discussed in terms of current research on organizational processes. (24 ref)—*Journal abstract*.

367. Goldberg, Susan; Perlmuter, Marion & Myers, Nancy. (U Massachusetts, Amherst) **Recall of related and unrelated lists by 2-yr-olds.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 1-8.—Individually tested 10 boys and 10 girls aged 29-35 mo on a memory task requiring free recall of 2-item lists. Each of the 3 trials consisted of the randomly ordered presentation of 6 boxes each containing a pair of objects selected from 3 categories (food, animals, and utensils). For 3 of these pairs, the objects belonged to the same conceptual category. The remaining 3 pairs were formed of unrelated items from the same categories. No sex differences in response were noted nor did performance change systematically over trials. The mean number of correct responses and the mean number of correct pairs was higher for related items. Ss frequently reported the last object they saw first. (16 ref)—*Journal abstract*.

368. Groninger, Lowell D. (U Maryland, Baltimore County) **The role of images within the memory system: Storage or retrieval?** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 178-180.—Presented high- and low-imagery words to undergraduates by tape recorder at a 5-sec rate. Stimulus words and distractors were presented in a subsequent recognition memory test. Results support the effect of imagery instructions occurring at storage rather than at retrieval.

369. Hollan, James D. (Clarkson Coll of Technology) **Clarification of some effects of hierarchical organization upon free recall.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1227-1231.—Compared free recall for hierarchically presented conceptual hierarchies and list-presented hierarchies with either correct, random-within, or random-across organization. Ss were 60 undergraduates. Results indicate (a) greater recall for hierarchical than list presentation; and (b) greater recall for correct than for either random-within or random-across organization, with no difference between the random organizations.—*Journal abstract*.

370. Homa, Donald & Spieker, Susan. (New Coll, Div of Natural Sciences) **Assessment of selective search as an explanation for intentional forgetting.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 10-15.—Investigated an assessment of selective search as an explanation for intentional forgetting by measuring reaction time (RT) in paired-associate lists of varying length. Ss were 44 college students. On half of the trials, a postinput cue was provided which instructed S to forget either the 1st or 2nd half of the list, and a single-stimulus probe was presented from the remaining pairs. For 1 group of Ss, the response items within a list were unrelated nouns; for another group, the response items within each list were half from the same category, but the categories within a list were different. For both random and categorized lists, it was found that (a) RT increased with list length and (b) RT was significantly reduced by a forget cue, with some indication that this reduction was greater for categorized lists. It is concluded that the criteria for a selective-search interpretation for intentional forgetting were satisfied, and that, for the most recently presented items, a serial and self-terminating search may be involved.—*Journal abstract*.

371. Huang, I-Ning; Ballering, Lawrence & Nikl, Larry D. (U Wisconsin, Whitewater) **Isolation effect in immediate and delayed free recall.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 81-85.—Tested the von Restorff (isolation) effect under immediate and delayed single-trial free-recall situations with 70 college students. The isolate noun was placed on the 19th position in a list of 20 unrelated nouns for 2 experimental groups which were tested for immediate recall or 60-sec delayed recall. 2 equivalent control groups received no isolation. It was hypothesized that the isolated item is selectively rehearsed, and therefore the item is transferred from short-term memory into long-term memory. Consequently, the isolate should not be affected by factors affecting recall from the short-term memory. Results indicate that the delay interval did eliminate the recency effect, but the isolate remained unaffected. This lends support to the assumption that isolation effect is a long-term memory phenomenon.—*Journal abstract*.

372. Jenkins, James J. (U Minnesota) **Can we have a theory of meaningful memory?** In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Discusses problems in current models of memory, and suggests that remembering may be no more than a highly abstract description of a process which changes from one instance to another depending on the materials and circumstances involved. Data on forget-

ting, the interaction of tasks and free recall, and the effects of comprehension of meaning on what is remembered are examined. (16 ref)

373. Johnson, James H. (U. Utah, Medical Center) **Memory and personality: An information processing approach.** *Journal of Research in Personality*, 1974(Jun), Vol. 8(1), 1-32.—Presents a consensual model of memory based on information processing theory. The experimental literature on the interaction between memory and personality is reviewed in terms of this model. It is suggested that past research in this area failed to utilize the knowledge and techniques of information processing theory, and as a result, has confounded experimental variables. Suggestions for more appropriate research are offered. (6 p ref)—*Journal abstract*.

374. Johnson, Marcia K.; Doll, Theodore J.; Bransford, John D. & Lapinski, Robert H. (State U. New York, Stony Brook) **Context effects in sentence memory.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 358-360.—Studied the effects on recall of unrelated sentences of both appropriate and inappropriate contextual information relative to no contextual information with 159 undergraduates as Ss. Materials were presented at either fast or slow rates on study trials. Inappropriate contexts retarded performance under the fast presentation rate and, contrary to expectation, the beneficial effects of appropriate contexts did not diminish under the lower presentation rate. Overall, results provide further evidence of the importance for recall of the semantic context active during sentence processing.—*Journal abstract*.

375. Kail, Michèle & Segui, Juan. (National Ctr for Scientific Research, U Paris V—René Descartes, Lab of Experimental & Comparative Psychology, France) **[Mnemonic integration of linguistic sequences.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 157-170.

376. Karchmer, Michael A. (Kansas U., Medical Center, Child Research Lab., Kansas City) **Proportion of unitization as an index of cued recall level.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 351-357.—In 2 experiments on the cued and noncued recall of noun pairs, pairs were factorially varied as high (H) or low (L) in rated imagery-concreteness (I-C). Ss were a total of 192 college students. A measure of pair unitization, based on L. M. Horowitz and L. S. Prytulak's 1969 index, predicted relative levels of cued recall for a given set of comparisons. Whether cuing facilitated recall relative to noncued recall depended on I-C pairing, test delay, and instructed strategy. With imagery or associative strategy instructions, cuing facilitated recall for H-H pairs tested immediately or after a 24-hr delay, but not for L-L pairs. Cuing facilitated recall of mixed I-C pairs tested immediately, but not at a delay. With repetition strategy instructions, cued recall did not exceed noncued recall for H-H or L-L pairs.—*Journal abstract*.

377. Kausler, Donald H. (U Missouri) **Continuity of processes across variants of recognition learning.** In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Discusses the need for a general theory of recognition learning which accounts for both single-

and multiple-item discrimination. 2 kinds of evidence for process continuity are reviewed, and a new theory of recognition learning is presented, a modification of frequency theory, which argues that there are featural components (vs words) that act as recipients of response tags and that the sharing of these tagged features is the mechanism underlying false alarms. (81 ref)

378. Kelly, Richard T. & Martin, David W. (New Mexico State U.) **Memory for random shapes: A dual-task analysis.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 224-229.—Examined the role of rehearsal in the storage of visual information in 2 experiments with a total of 38 undergraduates. Both experiments involved recognition of random shapes which varied factorially along 5 levels of complexity and 2 levels of codability. In Exp I an interpolated activity was performed during 4-sec intervals following stimulus presentation. The interpolated task degraded recognition accuracy. Verbal codability facilitated recognition performance, but no main effect of stimulus complexity on recognition was found. Results of Exp II, which used simple reaction time probes rather than an interpolated activity, replicate these effects. Results suggest that retention of visual information requires processing capacity. Stimulus characteristics (e.g., codability) affect the extent of this processing.—*Journal abstract.*

379. Kroll, Neal E.; Kellicutt, M. H.; Berrian, Raymond W. & Kreisler, Alan F. (U California, Davis) **Effects of irrelevant color changes on speed of visual recognition following short retention intervals.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 97-106.—Describes 3 experiments in which a total of 80 undergraduates judged whether a pair of test letters had the same names as a memory pair presented either 1 or 8 sec earlier. 2 other (irrelevant) changes were possible: case (upper and lower) and color changes (red and green). Half of the Ss recalled the color of the memory pair following their same- vs different-name decision. As predicted under the visual memory hypothesis, same-name decisions were faster when the cases of memory and test pairs were the same. This reaction time difference (different case minus same case) was greater at 1 than at 8 sec and greater for Ss recalling color; however, it was unaffected by color change. Color change slowed decisions following both 1 and 8 sec for Ss recalling color, but only at 1 sec for Ss not recalling color. Neither case nor color effects were reduced when the distractor task (shadowing) was no longer required. This was interpreted as favoring the "alternative generation" rather than the "verbalization" explanation of why the case effect is often lost over longer retention intervals. (20 ref)—*Journal abstract.*

380. Kvale, Steinar. (U Aarhus, Psychological Inst, Risskov, Denmark) **Permanence and change in memory: II. Reproduction of words in sentences.** *Scandinavian Journal of Psychology*, 1974, Vol 15(2), 139-145.—Employed a retroactive interference paradigm for studying qualitative memory changes, using 2 groups of 20 German high school students as Ss. Sentences containing an ambiguous word that was defined differently by succeeding words were used as stimulus material. Such retroactive definitions of meaning led to qualitative changes in reproduction. It is suggested that the issue of

permanence and change in memory may be related to the choice of lists of independent items or contextual units as stimulus material. A contextual theory of memory, implying the conception of memory in a stream, is advocated.—*Journal abstract.*

381. Langhorne, John E. (Adrian Coll) **Analysis of multitrial free recall.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 9-19.—Reanalyzed constant and variable input effects in multitrial free recall, using a new method of measuring organization—intertrial organization variance (ITOV)—and a mathematical model of retention-forgetting. Ss were 40 female undergraduates. Results indicate that ITOV apparently measures a different type of organization than traditional measures. The trial-to-trial model of retention-forgetting quantitatively reveals results about free recall not apparent from traditional analysis.—*Journal abstract.*

382. LaPorte, Ronald & Voss, James F. (U Pittsburgh) **Paired-associate acquisition as a function of number of initial nontest trials.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 117-123.—To study the role of testing in paired-associate learning, the testing phase of paired-associate recall trials was replaced by a series of computational tasks. Following 0, 5, 10, 20, or 40 nontest pairing trials, 80 undergraduates received a recall trial and subsequently learned the list to a criterion of 1 errorless trial. Results indicate that although it took an average of 7.5 trials to learn the 12-pair list in the standard condition (Condition 0), mean recall was approximately 10 correct responses following 20 and 40 nontest trials and approximately 7 correct responses following 5 and 10 nontest trials. Mean trials to criterion, not including the nontest trials, was not significantly different among Conditions 0, 5, and 10, although Conditions 20 and 40 yielded significantly fewer trials to criterion than the other 3 conditions. Results support the view that testing facilitates the development of retrieval processes; an additional interpretation is that the test trial provides feedback which influences selective attention and/or rehearsal on the subsequent list presentations, thereby also influencing the acquisition of the associations.—*Journal abstract.*

383. Lishman, W. A. (U London, Inst of Psychiatry, England) **The speed of recall of pleasant and unpleasant experiences.** *Psychological Medicine*, 1974(May), Vol 4(2), 212-218.—Describes a method for comparing the speed of recall of pleasant and unpleasant experiences. Pleasant experiences were recalled significantly more quickly than unpleasant experiences by 20 healthy volunteers on a hospital social work or medical staff, especially by those scoring low on Neuroticism or high on Extraversion as measured by the Eysenck Personality Inventory. The overall pleasant-unpleasant differential persisted on retesting some months later with an alternative form of the test. The technique appears to be a valid and simple means for exploring hedonic selectivity in memory.—*Journal abstract.*

384. Lowry, Douglas H. (Michigan Technological U) **The effects of mnemonic learning strategies on transfer, interference, and 48-hour retention.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 16-20.—Compared the effects of instructions to use imagery, sentence, or repetition strategies on original learning,

negative transfer, retroactive interference (RI), and 48-hr retention. After reaching a common criterion in learning A-B pairs, 144 college students were either given 10 study-test trials on a list of A-D or C-D pairs or engaged in a filler task. During acquisition, mnemonic strategies did not affect negative transfer, RI, or 48-hr retention. It is concluded that mnemonics only affect the rate of acquisition in paired-associate learning. The basis for mnemonic effects may be centered on the associative process as opposed to modification of stimulus attributes.—*Journal abstract*.

385. López, Mike; Hicks, Robert E. & Young, Robert K. (U Texas, Austin) **Retroactive inhibition in a bilingual A-B, A-B' paradigm.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 85-90.—Investigated the effects of giving no cues to indicate the language of a specific response on the learning of paired-associate lists by 32 Mexican-American college students who were bilingual in English and Spanish. A retroactive inhibition design was used with 4 conditions of transfer. Results support an interdependence hypothesis of bilingual organization of memory.—*Journal abstract*.

386. Lutz, William J. & Scheirer, C. James. (State U New York, Binghamton) **Coding processes for pictures and words.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol 13(3), 316-320.—Presented 288 undergraduates, in groups of 12, with either pictures or with the verbal names of the pictures in a recognition paradigm. Items were presented for either .25, .50, 1.00, or 2.00 sec with either .25, 1.00, or 2.00 sec between successive items. A recognition test followed where Ss gave confidence judgments on a 6-point rating scale as to whether they had seen the items before. Analysis of both correct responses and O sensitivity (estimated by signal detection theory methods) indicated that the processing rate for words was greater than the processing rate for pictures during the presentation interval, while these rates did not differ as a function of the interslide interval. Results are interpreted in terms of continuous processing models.—*Journal abstract*.

387. Marken, Richard S. & Sandusky, Arthur J. (U. California, Santa Barbara) **Stimulus probability and sequential effect in recognition memory.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 49-51.—Conducted an experiment with 12 undergraduates in which the bias for reporting "old" in a recognition-memory task varied inversely with the probability of presenting a previously studied item. The bias for an "old" response was also greater when the stimulus on the preceding trial was a new item. Results invalidate the assumptions of the theory of signal detection for recognition memory and indicate a need for sequential analysis of recognition memory data to obtain unambiguous measures of bias and retention.—*Journal abstract*.

388. Maskarinec, Ann S. & Brown, Sam C. (Kansas State U) **Positive and negative recency effects in free recall learning.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol 13(3), 328-334.—Examined the relationship between the magnitude of the positive recency effect in immediate free recall (IFR) and the magnitude of the negative recency effect in final free recall (FFR). 140 undergraduates learned 10 lists, followed by a FFR test. Across Lists 1-8 (each 21 words

in length) there was an increase in positive recency in IFR and a concomitant increase in negative recency in FFR. There was no negative recency in FFR for List 9 which was a short list (12 words), and List 10 (21 words). These results, plus order of recall data, support the hypothesis that negative recency is the product of a strategy wherein Ss learn to superficially encode end items in IFR because this is sufficient to guarantee their immediate recall.—*Journal abstract*.

389. McCormack, P. D. (Carleton U, Ottawa, Ontario, Canada) **Recognition memory for common words as a function of target/distractor ratio.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 445-446.—Gave adults 3 recognition-memory lists having different target to distractor (T-D) ratios. The obtained hit probabilities were invariant across successive fifths of a list under all conditions and were inversely related to T-D ratio. False alarms increased as a function of fifths of a list, the rate being inversely related to T-D ratio. Data are interpreted within an interference framework.

390. Miscik, John G. & Deffenbacher, Kenneth A. (Aberdeen Proving Ground, Human Engineering Lab, MD) **Short-term retention of visual sequences as a function of stimulus duration and encoding technique.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 188-190.—An earlier study concluded that (a) facilitation of short-term recall for auditory digit sequences by increases in digit duration were due to increased rehearsal time available and (b) efficient encoding techniques improved recall regardless of retention interval length. The present study confirmed these conclusions when digit sequences received both a visual and an auditory encoding.

391. Morris, P. E. & Stevens, R. (Open U, Bletchley, England) **Linking images and free recall.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol 13(3), 310-315.—An examination of the literature on free recall with instructions to form mental images suggests that recall is facilitated only when the images which are formed link items together. In Exp I and II 30 and 12 undergraduates, respectively, were instructed to form images which linked together 3 items in 1 image, or to form separate images to each item. Recall was facilitated for the linking imagery Ss, but the separate imagery Ss had no better recall than the controls. Exp III with 18 additional Ss demonstrated that there was no interference with subjective organization in the single image condition. Apparently, mental imagery improves free recall through strengthening of the association between items, and not by improving the distinctiveness, availability, or form of storage of the individual items. (20 ref) —*Journal abstract*.

392. Nace, Edgar P.; Orne, Martin T. & Hammer, A. Gordon. (Inst of the Pennsylvania Hosp, Philadelphia) **Posthypnotic amnesia as an active psychic process: The reversibility of amnesia.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 257-260.—Administered the Stanford Hypnotic Susceptibility Scales to 60 male undergraduates. Following suggested posthypnotic amnesia, highly hypnotizable Ss differed from less hypnotizable Ss not only in the small number of items recalled after hypnosis was terminated, but also in the high proportion of forgotten items subsequently remembered at an

appropriate signal. The joint effect of these processes is the absence of differences in total recall once amnesia is removed. Recovery of amnesic items after amnesia is lifted may serve as a criterion to distinguish ordinary forgetting from hypnotic amnesia and the ability to recover this transiently forgotten material may be used to predict future hypnotic performance. Reversibility is as effective a predictor as amnesia itself. Hypnotic amnesia can best be understood as an active process involving a reversible disturbance of memory retrieval. (16 ref) —*Journal abstract.*

393. Nelson, Thomas O. & Hill, Charles C. (U Washington) **Multiple retrieval paths and long-term retention.** *Journal of Experimental Psychology*, 1974(Jul), Vol. 103(1), 185-187.—Compared long-term free recall for Ss who learned either multiple retrieval paths (MPs) or a single retrieval path (SP). Although the 2 conditions had the same number of exposures to the items during acquisition, 7 wks later MP Ss had 23% higher free recall than SP Ss. Findings demonstrate that multiple retrieval paths facilitate long-term retention.

394. Okada, Ronald & Burrows, David. (Atkinson Coll., York U., Downsview, Ontario, Canada) **Divided attention and high-speed memory search.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 191-195.—Conducted a memory search experiment with 4 undergraduates using a fixed-set procedure. In the control condition, each item in the memory set was tested equally often. In the experimental condition, 1 item in the memory set was tested more often than the remaining items. Reaction time for positive and negative responses increased linearly with set size in both conditions and the 4 slope values did not differ. This result suggests that the overall rate of memory search was equivalent for the 2 conditions. However, in the experimental condition the frequently tested item was retrieved more quickly than the remaining items. This finding is inconsistent with an exhaustive search model. An alternative model involving a parallel search process is outlined. (16 ref) —*Journal abstract.*

395. Pellegrino, James W. (U. Pittsburgh) **Organizational attributes in list acquisition and retention.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 230-239.—Investigated acquisition and delayed retention in 200 undergraduates for a list that could be hierarchically structured according to taxonomic, orthographic, and relative size attributes. Experimental conditions varied the number of instructed attributes (3, 2, or 1) and the main attribute in the hierarchy (taxonomic or orthographic). Cued recall acquisition was facilitated by both instructions about additional attributes and the presence of the taxonomic attribute as the primary basis of recall organization. Free-recall retention was also facilitated when the taxonomic attribute was the primary list attribute, but there was no effect for number of instructed retrieval attributes. Organization data show that the latter result was not due to the loss of any attributes in multiple attribute conditions. Results are explained in terms of levels of processing, the relative contribution of the various attributes to the retrieval and recognition components of recall, and the importance of each component in list acquisition and retention. (15 ref) —*Journal abstract.*

396. Reardon, Eugene; Da Polito, Frank & Polzella, Donald. (U Dayton) **Associative organization in recognition memory.** *Perceptual & Motor Skills*, 1974(Jun), Vol. 38(3, Pt 2), 1123-1126.—Studied the effect of organization in word recognition. 40 undergraduates learned lists of 30 words, 15 presented in associatively related triplets and 15 presented in associatively unrelated triplets. No difference was found between lists when  $d'$  values were used as a measure of recognition performance. However, Ss gave higher confidence judgments for hits and false alarms from associatively related triplets. Results suggest that the familiarity distributions of old and new items may have shifted upward under the organized condition. —*Journal abstract.*

397. Restle, Frank. (Indiana U) **Critique of pure memory.** In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—Presents a theoretical analysis of the memory structure and organization and the relationship between the commonly recognized levels of memory (e.g., sensory buffer and short- and long-term memory). The process of information flow is examined in terms of expectancy and analysis functions. It is suggested that encoding is the process of incorporating information into a cognitive structure and that the depth of processing depends on the size and generality of the structure involved; storage is the maintenance of this organization. (20 ref)

398. Roenker, Daniel L. (Iowa State U.) **Role of rehearsal in long-term retention.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 368-371.—Investigated the role of rehearsal in long-term storage and retention within the negative recency paradigm, using 75 college students as Ss. For 1 group of Ss an unfilled interval was interpolated between presentation and test of each list in initial recall. For a 2nd group initial recall was also delayed, but only the 1st 1/2 of the interval was unfilled. Following several such lists a final free recall (FFR) of all items was required. Analysis of overt rehearsal patterns exhibited during the unfilled intervals showed that the number of rehearsals an item received was not related to FFR performance. Results are viewed as consistent with the position that there are 2 types of rehearsal—1 which facilitates long-term retention and 1 which does not. —*Journal abstract.*

399. Rosenberg, Sheldon; Schiller, William J. & Smith, Joan A. (U. Illinois, Chicago Circle) **Semantic factors in intentional and incidental sentence recall.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 19-21.—Exposed 6 independent groups of 20 undergraduate Ss each to normal or anomalous sentences under an incidental-nonsemantic (letter estimation), incidental-semantic (familiarity rating), or intentional-only orientation. Written recall followed 1 presentation of the sentences in each group. None of the differences between intentional and incidental-semantic Ss was significant, and semantic coding facilitated recall performance for both normal and anomalous sentences but to a greater extent for normal sentences. —*Journal abstract.*

400. Rosenthal, Ted L.; White, Glenn M. & Alford, Geary S. (U Arizona) **Some memory effects with sequential impoverished visual stimuli.** *Perceptual &*

*Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1115-1120.

—Studied retention of visual paths in 2 experiments using homogeneous circles presented graphically or by lights to minimize irrelevant cues that might support covert labeling. Ss were 90 undergraduates in Exp I and 60 in Exp II. Path lengths of 3, 5, 7, and 9 nodes, and memory loads of 1, 2, and 4 paths in depth were included. In both studies, simultaneous exposure led to better recall than serial presentation, and memory proved robust with little loss between 2- and 4-path memory loads. Providing letter props greatly improved retention. The effects of constant vs on-then-off light exposure depended on the length of paths.—*Journal abstract*.

401. Rosner, Sue R. & Lindsley, Diane T. (U Iowa) **The effects of retention interval on preschool children's short-term memory of verbal items.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 72-80.

—Tested the short-term recall of word triads by comparing retention over 3 types of intervals within 24 preschoolers. Retention was significantly lower in the 16 sec unfilled interval condition than in the immediate test condition. This result, predicted from preschoolers' rehearsal deficiency, differs from those obtained in previous adult and child studies. A filled interval condition, requiring irrelevant verbal activity during the 16-sec period, significantly reduced recall from that of the unfilled interval condition. Recognition of the word items on a subsequent recognition test was greater than chance and was not affected by interval condition. This suggests that the condition effects in short-term recall did not disrupt the long-term storage of the items. (15 ref)—*Journal abstract*.

402. Salzberg, Philip M. & Pellegrino, James W. (U Colorado) **The generation and recognition components of encoding specificity.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 9-11.—Used E. Tulving and D. M. Thompson's (see PA, Vol 80:10409) generation-recognition-recall paradigm using 6 groups of 18 undergraduate Ss each. The critical comparison involved the relative effectiveness of category cues which were either the same as or different from the input encoding of an item. Additionally, an attempt was made to gain control over any bias in responding to the cues by the manipulation of instructional information about the relevance of each cue. Results show that the probability of generating target items was slightly superior for same cues. Encoding specificity (defined as the same-different cuing effect) was demonstrated both in the recognition of generated items and in cued recall. Instructional manipulation generally tended to attenuate the same-different effect in recognition, thus suggesting a response bias component of the effect.—*Journal abstract*.

403. Segal, Bernard & Feger, Gary. (Murray State U) **Drug use and fantasy processes in college students.** *Journal of Altered States of Consciousness*, 1973(Fal), Vol 1(1), 5-14.—Used a drug-use questionnaire and Singer's Imaginal Process Inventory to study imagery and daydreaming correlates in 68 college marijuana users. A relationship between imagery processes and marijuana use was indicated. Marijuana users were more receptive of fantasy and were oriented toward seeking new experiences. It is concluded that marijuana may be used

to stimulate specific kinds of fantasies, and these may be related to basic personality characteristics. (25 ref)—*Journal abstract*.

404. Segui, Juan. (National Ctr for Scientific Research, U Paris V—René Descartes, Lab of Experimental & Comparative Psychology, France) **[Differential retention of sentence components: Functional role or syntactic category?]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 171-178.—Attempted to determine whether the grammatical function of a word determines the probability that it will be retained. The nouns studied had the relation modifier-modified: one a nuclear noun (subject or object), the other its complement. Retention was better for the modified than for the modifier and recall of the modifier strongly related to recall of the modified. While recall of the modifier seemed to imply a preliminary recall of the modified, the converse was not true.—G. Rubin-Rabson.

405. Shiffrin, Richard M. & Grantham, D. Wesley. (Indiana U) **Can attention be allocated to sensory modalities?** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 460-474.—Examined the effects of attention allocation to the modalities of vision, audition, and touch in 3 experiments with a total of 14 paid undergraduates. Exp I and II simultaneously monitored all 3 sensory modalities for the presence of a near-threshold stimulus. A successive condition allowed S to give his full attention to each sensory modality in turn. There was no advantage for the successive condition, whether the task consisted of detection of a single stimulus (Exp I) or detection of the absence of one of many stimuli (Exp II). Exp III used a different paradigm to extend these results and bridge the gap between these results and those of others. It is concluded that selective allocation of attention to sensory modalities does not affect the early stages of perceptual processing. (39 ref)—*Journal abstract*.

406. Siegel, Jane A. (U Western Ontario, London, Canada) **Sensory and verbal coding strategies in subjects with absolute pitch.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 37-44.—Examined the performance of 6 university music students with absolute pitch and 6 without absolute pitch (controls) in 3 studies involving recognition memory for tone frequency. When the standard and comparison were 1/10 of a semitone apart, absolute-pitch Ss reported using a sensory coding strategy and did not differ from the controls in overall performance or rate of forgetting. When the stimulus difference was 3/4 of a semitone, absolute-pitch Ss shifted to a verbal coding strategy, and their memory for pitch was significantly better than the controls. With a 1-semitone difference, the absolute-pitch group showed no significant forgetting over a 15-sec retention interval filled with interference tones. These findings support the hypothesis that possessors of absolute pitch show superior pitch memory only when they can differentially label the stimuli with musical note names. (22 ref)—*Journal abstract*.

407. Skinner, Nicholas F.; Willems, Elizabeth & Stretch, Roger. (King's Coll, U Western Ontario, London, Canada) **Chunking vs associative chaining in paired associate recall.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 109-116.—Investigated paired-asso-

ciate (PA) recall under a retroactive inhibition paradigm with 64 college students. During original learning (OL), Ss learned PA response trigrams composed of either consonants, digits, or letter-digit combinations. Each interpolated learning (IL) response was identical to an OL response with the exception of the middle element. Although experimental Ss made significantly more complete errors (failure to recall entire IL trigrams under modified-modified-free-recall) than control Ss (who were not required to learn the IL list) on all types of verbal response content, overall results are consistent with both chunking and associative-chaining hypotheses of recall.

—*Journal abstract.*

408. Snodgrass, Joan G. & Antone, George. (New York U) **Parallel versus sequential processing of pictures and words.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 139-144.—A total of 40 undergraduates in 2 separate groups were shown picture and word pairs presented either in a spatial or a temporal relationship. The recognition test consisted of the same pairs with half in a reversed and half in the same order. Ss indicated on a 4-point rating scale which pairs were reversed and which were in the same order. Spatial memory was superior to temporal memory, and picture memory was superior to word memory, with no interaction between type of relationship and type of material. Thus no evidence was obtained for A. Paivio's hypothesis that verbal codes are specialized for sequential processing and pictorial codes for parallel processing. (23 ref)—*Journal abstract.*

409. Solso, Robert L. (Loyola U, Chicago) **Memory and the efficacy of cues or "yes, I know!" vs "why didn't I think of that?"** In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974. ix, 386 p. \$14.95.—A review of the literature suggests that information on stimulus selection may also clarify variables affecting cue saliency, the nature of the structure of memory, decoding processes, and how stored information is synthesized. 2 factors which have paradoxical effects on cue efficacy are examined, and the process of multiple encoding and the application of the interstructural associative paradox to a variety of cognitive functions are discussed. (41 ref)

410. Sulin, Rebecca A. & Dooling, D. James. (Kent State U.) **Intrusion of a thematic idea in retention of prose.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 255-262.—Tested 2 implications of F. C. Bartlett's (1932) theory of memory: (a) that prose passages are stored in schematic form and (b) that thematic assimilation increases with the passage of time. In 2 experiments a total of 336 college students read brief biographical passages about either a famous or a fictitious person (e.g., Adolph Hitler vs Gerald Martin). Recognition memory for individual sentences was tested after intervals of either 5 min or 1 wk. As expected, passages with a famous main character yielded more false positive errors. In addition, the errors in this condition depended on the thematic relatedness of the recognition foil. The further prediction on thematic assimilation was also upheld—thematic effects were relatively greater at the longer retention interval. —*Journal abstract.*

411. Timmons, Beverly A. (U Victoria, British Columbia, Canada) **Delayed auditory feedback as a factor influencing retention.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 399-402.—Measured retention of difficult prose by 4 groups of 20 undergraduates, each, using a multiple-choice test. Group 1 read under normal conditions and was tested immediately. Group 2 read under normal conditions and was tested after 24 hrs. Group 3 read under .2-sec delayed auditory feedback with immediate testing, while Group 4 also read under delay but was tested after 24 hrs. All Ss reading under normal conditions obtained significantly higher scores than did the delayed groups. It is speculated that delayed auditory feedback may affect acquisition rather than retention. (18 ref)—*Journal abstract.*

412. Tunnell, Gilbert B. & Falkenberg, Philippe R. (Wake Forest U) **Effect of context on transfer of information from short- to long-term memory.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 495-501.—Conducted an experiment with 48 undergraduates, in which manipulation of the context in a short-term memory paradigm produced changes in the ability to recognize the same material from long-term memory 24 hrs later. If immediate recall was accurate, later recognition was improved if this recall was conducted with the same context as occurred at learning. If immediate recall was completely inaccurate, later recognition was improved if this recall was conducted with different context than was present at learning. Short-term recall did not need to be accurate to transfer learned nonsense trigrams to long-term memory. Manipulation of context 24 hrs after learning had no effect on recognition. Results are discussed in terms of the N. C. Waugh and D. A. Norman memory model, E. Tulving's encoding specificity hypothesis, and interference theory. —*Journal abstract.*

413. Wade, Terry C. (U. Utah) **Relative effects on performance and motivation of self-monitoring correct and incorrect responses.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 245-248.—Conducted a laboratory analog study with 32 college students to investigate the relative effects on responding and self-rated motivation when differently evaluated performance feedback components are self-monitored. A linear teaching machine programed with 10 sets of match-to-sample items was employed. Those Ss monitoring their correct or incorrect responses were compared to Ss receiving simple performance feedback and a control group which received neither self-monitoring instructions nor performance feedback. Specific analysis of the number and the proportion of correct responses indicated an overall superiority of self-monitoring compared to the other conditions. Analyses of the self-monitoring groups revealed a decline in performance over time for Ss recording their correct responses relative to Ss recording their incorrect responses. Additionally, repeated motivational self-ratings were highly correlated with correct response rates over time. —*Journal abstract.*

414. Walter, Donald A. & Hellebusch, Stephen. (U Notre Dame) **The role of associative elaboration in word recognition: Evidence for a two-stage test elaboration sequence.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 79-84.—Previous studies demonstrate that word associates presented for recognition in a

list are often misrecognized as their earlier root word; however, if the root word follows its associate, root word misrecognition does not occur. Results in the former situation have been explained by positing that early-activated implicit associative responses (IARs) are mistaken for later-activated representational response (RRs). In the present study it is argued that this explanation requires 1 of 2 modifications to explain lack of misrecognition in the latter situation. The 1st posits that IARs show greater memory persistence than RRs and predicts that false positive rates of the 2nd members of forward and backward associated list word pairs have different retention interval functions. The 2nd predicts no such difference because S discriminates PRs from IARs at the time of encoding and uses only RRs for "memory matches." No differences occurred over 5 retention intervals with 40 undergraduates. The 1st hypothesis was discarded; a 2-stage test elaboration sequence in word recognition is suggested.—*Journal abstract.*

415. Ward, L. Charles; Bennett, Jean H. & Bradford, C. (Murray State U) **The effects of postresponse stimulus duration upon the short-term retention of verbal discrimination pairs.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 87-92.—Tested 60 undergraduates for short-term retention of verbal discrimination pairs consisting of 3-place consonant syllables with high intrapair formal similarity. Each pair was shown twice with successive presentations separated by either 0, 1, 2, or 3 interpolated pairs. Different groups received either a 0-, 1-, or 3-sec postresponse stimulus duration (PSD)—duration of exposure of the stimulus pair following a button-pressing response. Increasing PSD from 0 to 1 sec led to improved retention, but the increase from 1 to 3 sec resulted in no further improvement. Retention decreased with increasing numbers of interpolated items, and the rate of decrease was not dependent upon PSD. Contingent probability analyses showed that the probability of a correct response on the 2nd occurrence of a pair was higher following a correct guess to its 1st occurrence than following an incorrect guess.—*Journal abstract.*

416. Warren, Linda . (Williams Coll) **An analysis of proactive inhibition in a cued recall task.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 131-138.—In a study with a total of 216 college students, control (C) groups learned a test list of initial letter-cued adjectives, while experimental (E) groups learned 2 prior lists and then the test list. One C and 1 E group were tested under each of 3 recall conditions either 15 min or 48 hr after learning. Analysis of the recall results focused on assessing the role of loss of response availability, loss of list differentiation and response competition in producing proactive inhibition. The underlying source of interference appeared to be loss of list differentiation. It is suggested that competition and loss of availability might be consequences of this loss, rather than reflecting independent interference mechanisms. (16 ref)—*Journal abstract.*

417. Weiss, Ethel & Warshak, Richard . (City Coll, City U New York) **Three studies of retroactive-inhibition during free-recall from a disinhibition perspective.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2),

1151-1157.—Studied the effect of a whistle (hypothesized to be disinhibiting) on retroactive inhibition in 3 experiments with a total of 288 undergraduates. Each experiment used a 2 (whistle vs no whistle)  $\times$  3 (retroactive inhibition, unrelated list, or unrelated task conditions) factorial design. In Exp I an unexpected blast (whistle condition) was presented as Ss began terminal List-1 recall. In Exp II the whistle was presented as Ss began the 1st test trial of List-2 acquisition. In Exp III the whistle was presented as Ss began the 3rd (and terminal) test trial of List-2 acquisition. The disinhibition hypothesis was not supported. The whistle impeded the organization of List 1 in Exp I, reduced the amount of transfer in List 2 in Exp II, and had no effect on relatively well-learned material in Exp III. It is concluded that a novel stimulus tends to disrupt labile learning, and that the effects are specific and transitory.—*Journal abstract.*

418. Winnick, Wilma A.; Kooper, Fae & Sprafkin, Joyce. (Queens Coll., City U. New York) **Free recall as a function of type of evoking stimulus.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 269-273.—Conducted 2 experiments with a total of 96 undergraduates. In Exp I, recall for words whose definitions were presented was contrasted with recall following presentations of pictures of the objects denoted by the words and of the words themselves. Highest recall scores were produced by the definitions in comparisons both across 3 groups given different materials and within a 4th group given the 3 kinds of materials. Exp II compared recall following presentation of the same definitions with recall for the same words in 2 other verbal context—sentences ending in these words and the same sentences in incomplete form that required the word to be supplied. The superior recall found for both incomplete sentences and definitions appeared to be caused by a combination of imagery arousal and problem-solving activity.—*Journal abstract.*

### Motivation & Emotion

419. Badia, Pietro; Culbertson, Stuart A. & Harsh, John . (Bowling Green State U) **Relative aversiveness of signaled vs. unsignaled avoidable and escapable shock situations in humans.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 338-346.—Conducted 2 experiments dealing with signaled and unsignaled shock, using a total of 18 male college students. In Exp I 6 Ss avoided shock, and in Exp II 12 Ss escaped shock by pressing one button under an unsignaled shock condition. By pressing on a separate button, Ss could change to signaled avoidance (Exp I) or signaled escape (Exp II). All Ss changed from the unsignaled to signaled condition whether shock was avoidable or escapable. 6 Ss were also given a chance to change from signaled to unsignaled escapable shock. Changeover responding remained at or near operant levels for these Ss. Comparing results of this study with studies using the rat revealed much similarity but some differences. Differences depended upon whether an escapable or avoidable procedure was used.—*Journal abstract.*

420. Cupchik, Gerald C. & Leventhal, Howard . (U Toronto, Ontario, Canada) **Consistency between expressive behavior and the elevation of humorous stimuli:**

**The role of sex and self-observation.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 429-442.—2 studies investigated the relationship between the expressive behaviors of smiling and laughing (mirth) and the evaluations of the funniness of cartoon stimuli. Study 1 replicated past findings that suggest that feedback from mirth reactions directly influences funniness ratings in female Ss but does not directly influence funniness ratings in male Ss. Study 2 provided evidence of a sex difference in the link between mirth and evaluation. It was hypothesized that making Ss aware of their mirth, by asking them to self-observe and rate their own smiling and laughing, isolates the mirth reactions and reduces their influence upon evaluations of funniness. The elimination of the influence of mirth should lower funniness ratings of female Ss and eliminate any increase in rated funniness produced by canned laughter. No such effects were predicted for males. The data support the hypotheses. A wider range of possible causes for self-observation effects is given than is mentioned in most recent theories of self-observation. (31 ref)—*Journal abstract*.

421. Davis, John & Lamberth, John. (U. Oklahoma) **Affective arousal and energization properties of positive and negative stimuli.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 196-200.—Investigated affect-arousing and energizing properties of positive and negative reinforcing stimuli with 75 undergraduates. Ss received positive evaluations (PE), similar attitudes (SA), neutral statements (NS), dissimilar attitudes (DA), or negative evaluations (NE) presented on slides. Pre- and postslide semantic differentials were filled out by each S as a measure of affect. All Ss then learned a paired-associate (PA) list composed of both noncompetitive and competitive pairs as a measure of energization level. The Taylor-Spence drive theory predictions for performance on noncompetitive and competitive tasks provided a sensitive measure of relative drive re-energization levels induced by the reinforcing stimuli. Consistent with past research, semantic differential scores showed NE more powerful than DA in arousing negative affect and PE more powerful than SA in arousing positive affect. Performance on the PA learning task showed a higher energization level for the NE condition than for the DA condition. The PE and SA conditions were hypothesized to be energizing rather than drive reducing. In support of the hypothesis, the PE condition showed a higher energization level than the SA condition. (16 ref)—*Journal abstract*.

422. Day, David A. & Rourke, Byron P. (St Michael's Hosp, Toronto, Ontario, Canada) **The role of attention in "lie-detection."** *Canadian Journal of Behavioural Science*, 1974(Jul), Vol 6(3), 270-276.—Randomly assigned 80 male college students to 1 of 4 groups. Tape-recorded instructions directed Ss in Groups 1 and 2 to evaluate a psychological case history or a newspaper story, respectively. Group 3 read about a kidnapping after being told they were participating in a lie-detection experiment and would be questioned on the material later. Group 4 was given the same information as Group 3, but was told that they should not reveal the information when questioned. Galvanic skin responses (GSRs) were measured as Ss listened to tape-recorded

questions on the material read; no verbal responses were made. The E then attempted to determine "blindly" which target information S had received by examining the GSRs. The number of Ss whose given information was successfully detected was significant in Groups 2, 3, and 4. Results suggest that simply attending to or focusing upon relevant information is a sufficient condition for detectability in a lie-detection situation. (French summary)—A. Olson.

423. Ekehammar, Bo. (U Stockholm, Psychological Lab, Sweden) **Sex differences in self-reported anxiety for different situations and modes of response.** *Scandinavian Journal of Psychology*, Vol 15(2), 154-160.—Citing the need for studies of sex differences for inventories where both situations and modes of response are selected separately, an analysis was made with regard to sex differences in both level and variability of self-reported anxiety for total scores, factor scores, and single situation and response scales. Ss were 58 male and 58 female 9th graders. The inventory comprised 17 situations and 18 modes of response. With a few minor exceptions the analyses showed consistent sex differences throughout, with females scoring higher than males and showing greater interindividual variability in reported anxiety. Results are discussed in relation to sex differences reported for physiological variables. (43 ref)—*Journal abstract*.

424. Haley, Graham A. (York U., Toronto, Ontario, Canada) **Eye movement responses of repressors and sensitizers to a stressful film.** *Journal of Research in Personality*, 1974(Jun), Vol. 8(1), 88-94.—A total of 24 undergraduates scoring high, intermediate, or low on the Byrne Repression-Sensitization Scale viewed an industrial accident film while horizontal eye movements were assessed by means of infrared corneal reflection. Neutral and stressful film segments were scored in terms of deviations from the center of the perceptual field (point-of-looking scores), and the standard deviations of these scores were calculated as an index of perceptual scanning. A stressful segment was also dichotically scored to determine whether the point of looking was on or off dominant elements of the scene. Results indicate that repressors and sensitizers had equivalent levels of perceptual scanning (which were significantly higher than intermediates' level) and were independent of film segment content. However, repressors and sensitizers differed in on-off and average point of looking for the stressful segment such that repressors were avoiding stressful content. Data suggest that relatively high perceptual scanning can be an avoidant defensive style of attending to dynamic stimulus displays. The issue of adaptiveness of responding is considered. (18 ref)—*Journal abstract*.

425. Haney, Jack N. (Memphis State U) **Repressors' and sensitizers' affective change during free association.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1172-1174.—30 undergraduates identified as either repressors, sensitizers, or controls by Byrne's Repression-Sensitization scale free associated to threatening and nonthreatening stimuli for 1-40 sec, giving ratings of affective states after each response period. In spite of the fact that sensitizers showed greater "approach" responding, they did not reduce their anxiety levels. Data suggest

the need to reevaluate the presumed anxiety-reducing function of sensitizing behaviors.

426. Jernyrd, Elisabeth. (U Malmö, School of Education, Sweden) **Optimal resistance to authority and propaganda: Measuring instruments, age developments, and educational influences.** *Didakmetry & Sociometry*, 1973, Vol 5(2), 27-53.—Investigated the ability of students to differentiate between different types of information, to make independent decisions, and to resist nonobjective attempts to influence them. Experimental test batteries and measuring instruments included (a) methods intended to give information as to how far the students choose, pass on, or are influenced by nonobjective information; (b) perception experiments with group pressures; (c) ratings; and (d) personality tests (related to anxiety, rigidity, authoritarianism, dogmatism, self-esteem, and field dependence). The test data from a total of 630 1st, 3rd, 5th, 7th, and 9th graders were subjected to factor analyses, and detailed analyses of age and sex differences were made. A preliminary teaching-material unit (intended to increase students' ability to protect themselves when exposed to nonobjective influence) was constructed and tested. Recommendations for continued research and practical application are outlined. (26 ref)—*Journal abstract*.

427. Madsen, K. B. (Royal Danish School of Educational Studies, Copenhagen) **Modern theories of motivation: A comparative metascientific study.** New York, NY: John Wiley & Sons, 1974. 472 p. \$27.50.—Presents an analysis of the important theories of motivation in an attempt to establish a new scientific discipline—the comparative study of theories of "systematology." The concept of this new metascience is outlined, and an historical introduction to motivational psychology and the metastrata, hypothetical strata, and descriptive strata of over 30 theories of motivation are presented. (8 p ref)

428. Neufeld, Richard W. & Davidson, Park O. (U Western Ontario, London, Canada) **Dimensionality of subjective response to a selection of complex aversive stimuli.** *Canadian Journal of Behavioural Science*, 1974(Jul), Vol 6(3), 258-269.—Investigated the dimensionality of subjective responses to a variety of stressor stimuli using a multidimensional scaling procedure with 30 undergraduates as Ss. Results indicate that the subjective perception of these stimuli was multidimensionally determined but with only 1 inter-S viewpoint about the obtained dimensionality. Stimulus projections on 2 dimensions were significantly correlated with scaled values of a unidimensional stress scale and were found not to be independent of a subjective attention scale. Speculations about the nature of the obtained dimensional structure, along with possible implications for assessing mechanisms of coping with stress, are discussed briefly. (French summary) (41 ref)—*Journal abstract*.

429. Oliver, Steven D.; West, Robert C. & Sloane, Howard N. (U Utah) **Some effects on human behavior of aversive events.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 481-493.—Examined aggressive behavior in humans in 2 studies. In Exp I 10 37-52 yr old males working on a plunger-pulling task could receive a 3.5 mA

shock at 75% probability every 2 min. The shock was unrelated to their plunger pulling behavior. Ss could press a toggle switch to deliver electric shock to E, who was visible to the Ss as an alleged O. 3 sessions in which no shock was delivered alternated with 2 sessions in which shock was delivered. In shock sessions Ss pressed the toggle switch and shocked the O at an average rate more than 9 times higher than in the nonshock sessions. In Exp II baselines of aggressive behavior were collected for 3 consecutive 120 or 90 min segments daily. Ss were 2 7-8 yr old boys. Noncontingent time-out seemed to control an above-baseline rate of aggressive behavior in the segments in which it was programed, as well as in the segment adjacent to that in which it was programed, and in which time-out was not programed at all. Results replicate animal laboratory findings relating noncontingent aversive stimulation to aggressive behavior. (24 ref)—*Journal abstract*.

430. Weaver, Donald & Brickman, Philip. (Northwestern U) **Expectancy, feedback, and disconfirmation as independent factors in outcome satisfaction.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 420-428.—Contends that previous research on the expectancy disconfirmation problem has been unjustified in concluding that no disconfirmation effect exists because (a) proper tests for the effect were conducted only for low expectancy Ss and (b) cumulative effects of expectancy disconfirmation comparable to the cumulative effects of winning or losing were never assessed. The present study achieved these ends by unconfounding overall performance expectancy and expectancies, outcomes, and disconfirmations on individual trials. 96 college students were given either high or low overall expectancies and then played a series of 20 games. On each game, Ss made outcome predictions that were confirmed either 25, 50, or 75% of the time, independently of overall expectancies, trial outcomes, and overall feedback. Results show that a loss on a particular trial was less satisfying when unexpected and a win on a particular trial was more satisfying when expected only for Ss with high overall expectancies; cumulative expectancy disconfirmation had a negative effect on all of the Ss. (34 ref)—*Journal abstract*.

431. Zajonc, R. B.; Crandall, Rick; Kail, Robert V. & Swap, Walter. (U Michigan) **Effect of extreme exposure frequencies on different affective ratings of stimuli.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 667-678.—Conducted 2 experiments with female undergraduates ( $N = 152$ ) to examine the effects of extreme number of exposures on reactions to stimuli rated on several dimensions. Exp I gave a positive monotone relationship between affective ratings on the Good-Bad scale and the frequency of stimulus exposure, with frequencies as high as 243. Exp II obtained ratings for the same exposure frequencies on 4 scales, some of which measured affiliative approach while others measured exploratory approach reactions. The former tended to show an increase with frequency of exposure and the latter a decrease. Theoretical analysis attempted to reconcile experimental evidence which indicates increasing affect with increasing exposure and evidence for an inverted-U relationship. (36 ref)—*Journal abstract*.

## NEUROLOGY AND PHYSIOLOGY

432. Borkovec, Thomas D.; Stone, Norman M.; O'Brien, Gerald T. & Kaloupek, D. G. (U. Iowa) **Evaluation of a clinically relevant target behavior for analog outcome research.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 503-513.—Exposed 23 socially anxious and 23 nonanxious male undergraduates (determined by Fear Survey Schedule scores) to 2 brief interactions, 3 wks apart, with a female confederate. Half of each anxiety group were given low-demand-for-improvement posttest instructions, while half were presented high-demand instructions. The procedure validly discriminated the 2 anxiety groups on several self-report, behavioral, and heart-rate measures. Demand manipulations had no positive effect on any measure. Physiological arousal was substantial and showed no evidence of habituation from pre- to posttest exposures. (19 ref)—*Journal abstract*.

433. Krausman, David T. & Lenox, John R. (Johns Hopkins U., Medical School) **An on-line integrator for alpha quantification.** *Behavior Research Methods & Instrumentation*, 1974(May), Vol. 6(3), 317-320.—Presents details of an integrator which permits an alternate mode of operation where time-synchronized resets, in lieu of voltage-dependent resets, produce variable height voltage ramps whose amplitude is a direct function of the accumulated alpha activity per unit time. This method of preprocessing and signal conditioning the alpha components of the EEG waveform provides a simple analog registry of on-line real-time correlation of alpha activity with various physiological and behavioral activity.

434. Leon, Arthur S.; Thomas, Paul E.; Sernatinger, Eda & Canlas, Aida. (U Minnesota, Medical School, Div of Clinical Pharmacology) **Serum dopamine beta-hydroxylase activity as an index of sympathetic activity.** *Journal of Clinical Pharmacology*, 1974(Jul), Vol 14(7), 354-362.—Evaluated the sensitivity serum dopamine  $\beta$ -hydroxylase (DBH) as an index of sympathetic-adrenal function. Groups of male rats and 3 adult hospital patients served as Ss. Determinations on the rats were made following swimming stress; in the humans they were made with postural changes, cold pressor testing, and handgrip isometric exercises, and following coffee drinking, cigarette smoking, and ketamine anesthesia. Results indicate that rat serum DBH activity increased after swimming stress. In the human Ss there was inter-S but little intra-S variation. S's activity was not influenced by blood pressure levels or postural changes. Stimulation by cold pressor stress, handgrip isometric exercise, cigarette smoking, and ketamine administration inconsistently resulted in a small increase in serum DBH activity. It is concluded that as an index of sympathetic activity this approach is less sensitive than measuring circulating catecholamines in the rat, and is of limited value in humans. (23 ref)—*P. Federman*.

435. Smith, Jamie. (U Oklahoma, Health Sciences Ctr, Oklahoma City) **Regeneration in the mammalian central nervous system: A re-evaluation.** *Biological Psychology Bulletin*, 1973(Dec), Vol 3(2), 57-67.—Discusses recent findings in support of earlier conclusions that regeneration can achieve functional reconnections in the mammalian brain and spinal cord. Data contradicting the earlier conclusions are reviewed in the light of

new evidence. Some of the implications of neural regeneration for recovery of function after damage to the CNS are discussed. (38 ref)—*Journal abstract*.

436. Weiskrantz, Lawrence. (U Oxford, England) **Brain research and parallel processing.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 53-54.—Comments upon and counterviews an article by W. G. Webster (1973) on brain functions. The importance of both serial-processing and parallel-processing aspects of nervous system function is stressed.

437. Wittles, Ilene & Bornstein, Philipp E. (Washington U) **A note on stress and sex determination.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 333-334.—Examined D. H. and L. Schuster's hypothesis that relative stress of the mother and father is a determinant of the sex of the newborn (i.e., the less stressed parent reproduces its own gender). Studies of children born to women who were rape victims show that more of the newborns were male than female, and it is suggested that the hypothesis deserves further research.

## Neuroanatomy &amp; Electrophysiology

438. Arnauld, E.; Vincent, J. D. & Dreifuss, J. J. (U Bordeaux II, Faculty of Medicine, Lab of Neurophysiology, France) **Firing patterns of hypothalamic supraoptic neurons during water deprivation in monkeys.** *Science*, 1974(Aug), Vol 185(4150), 535-537.—Water deprivation in 5 adult female rhesus monkeys caused an acceleration of action potential firing of supraoptic neurons, but not of neurons located 2-3 mm above the hypothalamic supraoptic nucleus. Whereas in the normally hydrated animal only 12% of the neuroendocrine cells discharged periodically, the proportion of these periodic bursters increased markedly with increasing plasma osmolarity. This finding suggests that such periodically firing supraoptic neurons are those engaged in active neurohypophyseal hormone secretion.—*Journal abstract*.

439. Bartus, Raymond T. & Ferris, Stephen H. (Park-Davis & Co, Research Div, Ann Arbor, MI) **Neural correlates of habituation and dark adaptation in the visual cortex of the rat.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 55-59.—Implanted 16 albino rats with monopolar electrodes over primary visual cortex. Averaged evoked responses (AERs) to repetitive flashes of light were evaluated during habituation and dark adaptation at 2 stimulus intensity levels. No consistent changes occurred in the early AER components if Ss were dark adapted prior to testing. However, increases in amplitude of early components occurred over trials in non-dark-adapted Ss, with greatest increase occurring with the lower stimulus intensity. Changes occurred over repeated stimulus presentations, a finding easily explained by concepts of habituation. Increases and decreases in amplitude were observed depending upon the particular component, with the greatest effects resulting from stimulation with the less intense light. These changes support the notion that early and late components represent different classes of neural events. (24 ref)—*Journal abstract*.

440. Bliwise, D. et al. (U Chicago) **Facial muscle tonus during REM and NREM sleep.** *Psychophysiology*, 1974(Jul), Vol 11(4), 497-508.—Devised equipment and procedures for quantifying relatively noise-free record-

ings of low-amplitude chin and lip electromyograms (EMGs) during sleep. A total of 28 rapid-eye-movement (REM) periods were recorded from 5 paid female graduate and undergraduate students. Tonic EMG levels declined toward their lowest level of the night beginning 5 min in advance of REM periods. With very rare exceptions, the lowest EMG levels of the night were maintained throughout REM sleep. During the 20 min of non-REM (NREM) sleep which followed REM periods, mean EMG levels increased over the REM levels but were lower than those recorded during the 20 min of NREM sleep which preceded the REM periods. This pattern of tonic EMG variation obtained for each of the 1st 3 REM periods of the night.—*Journal abstract.*

441. Booth, C. S. & Hahn, J. F. (U Virginia) **Thermal and mechanical stimulation of type II receptors and field receptors in cat.** *Experimental Neurology*, 1974(Jul), Vol 44(1), 49-59.—Obtained single-unit responses from type II receptors and field receptors in 27 anesthetized cats in response to mechanical stimuli, thermal stimuli, and combinations of the stimuli. Coding of the 2 kinds of stimulus information was such that information about each kind of stimulus could be recovered from a population of field receptors but not from a population of type II receptors. The behavioral data available do not suffice to determine whether or not the thermal information is put to behavioral use.—*Journal abstract.*

442. Bothe, G. G.; Zahn, D. A. & Elfner, L. F. (Florida State U) **The effects of physical stimulus complexity on the auditory-evoked response.** *Biological Psychology*, 1974, Vol 1(4), 261-275.—Investigated whether the degree of stimulus-oriented attention as inferred from the cortical-evoked response varies systematically with the physical stimulus complexity. The 760-msec auditory stimulus consisted of 10 bursts of pure tone. 4 levels of complexity in 2 arrangements were employed, with 8 normally hearing undergraduates in each of the 8 conditions receiving 500 stimulus presentations/S. Evoked responses were detected through electrodes placed at the vertex and mastoid with a forehead ground. Direct observation of the data and the results of stepwise discriminant analyses show that  $N_1$ - $P_2$  amplitudes decreased over time in all conditions, although the effect was most prominent in the least complex stimulus conditions.  $P_2$ - $N_2$  amplitudes, however, showed an increase over time, with the increase most prominent in highly complex conditions. Results are discussed in terms of the repeated stimulation of specific neural units and neural recovery times. (19 ref)—*Journal abstract.*

443. Brask, T. & Falbe-Hansen, J. (Gentofte U Clinic, Copenhagen, Denmark) **Electronystagmography on normal persons.** *Acta Oto-Laryngologica*, 1974(Jun), Vol 77(6), 412-417.—Used electronystagmography to study spontaneous, positional, and caloric nystagmus in 20 normal persons. A pendulum test was also performed. 3 Ss exhibited spontaneous nystagmus and another 6 Ss had positional nystagmus in 1-4 positions. The pendulum test appeared well-suited for distinguishing between centrally and peripherally conditioned nystagmus. (German summary)

444. Burton, Charles E.; David, Robert M.; Portnoy, William M. & Akers, Lex A. (Texas Tech U, Biomedical Systems Lab) **The application of Bode analysis to skin**

**impedance.** *Psychophysiology*, 1974(Jul), Vol 11(4), 517-525.—Describes a method for analyzing skin impedance data and applies the procedure—Bode analysis—to the determination of a steady-state electrical model for intact human skin. Bode plots are employed to synthesize a passive equivalent circuit from sample measurements of "black box" skin impedance magnitude and phase angle, and representative values for the circuit elements are presented. (19 ref)

445. Cazard, P. (Langley Porter Neuropsychiatric Inst, San Francisco, CA) **[Interhemispheric synchrony of parietal-occipital alpha rhythms, attention, and conscious experience.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 7-22.—Recorded the EEGs of 6 Ss from 2 pairs of symmetrically positioned electrodes and determined the interhemispheric synchrony of the filtered alpha rhythms by a correlation coefficient. Positive values of  $r$  were used to determine the loudness of a tone fed back to the S. Sustained maximum loudness appeared when Ss succeeded in voluntarily maintaining a stabilized field of awareness and allowed themselves to be deeply absorbed in this cognitive act. When they made intense efforts to focus attention on activities like performing mental arithmetic or clenching the fist, the sound disappeared. A tone of medium and variable intensity corresponded to the usual fluctuations of the alpha rhythm of an S with eyes closed and mentally relaxed. Results suggest a distinction, from the EEG viewpoint as well as from the subjective one, between the effort of attention to an object and the effortless cognitive experience which results from it. (47 ref)—G. Rubin-Rabson.

446. Gruberg, Edward R. & Ambros, Victor R. (Massachusetts Inst of Technology, Research Lab of Electronics) **A forebrain visual projection in the frog (*Rana pipiens*).** *Experimental Neurology*, 1974(Aug), Vol 44(2), 187-197.—Traced a projection in leopard frogs from the lateral anterior thalamus via the lateral forebrain bundle to the ipsilateral striatum in the ventrolateral area of the forebrain. Single-unit recording revealed that this area contained visual units that responded to the on and off of light. (18 ref)

447. Hume, Ann L. (U Auckland, New Zealand) **Auditory detection and optimal response biases.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 425-433.—Trained 12 male albino rats to detect a signal consisting of an increment in the intensity of a random noise. One response was defined as correct and reinforced with brain stimulation if the signal was presented, and another was correct and reinforced if the noise alone was presented. In Exp I the probability of presenting the signal was varied over 4 values between .4 and .6. In Exp II the number of brain stimulations consequent upon a correct response in the presence of the signal was varied over 4 values between 3:1 and 1:2. Differences of .10 and .05 in the signal probability, and unit differences in the ratio of brain stimulations, resulted in distinctly different bias functions. Accuracy of detection increased with signal intensity and was independent of Ss' response biases. When the signal probability was varied, Ss optimized the number of correct trials and hence the number of brain stimulations obtained. When the ratio of brain stimulations was varied, Ss compromised

between optimizing the number of correct trials and optimizing the number of brain stimulations obtained. (31 ref)—*Journal abstract*.

448. Lidsky, T. I.; Levine, M. S. & MacGregor, S. (U Rochester) **Hippocampal units during orienting and arousal in rabbits.** *Experimental Neurology*, 1974(Aug), Vol 44(2), 171-186.—Recorded unit responses in CA1 of the hippocampus of 22 awake, restrained male New Zealand white rabbits concurrently with cortical EEG, nuchal electromyogram, and electrocardiogram. Changes in rate of unit activity were nonlinearly related to changes in arousal level, whether the latter occurred spontaneously or were evoked by novel stimuli. Data are discussed in relation to models proposing hippocampal roles in orienting and modulation of arousal. (24 ref)—*Journal abstract*.

449. Lidsky, T. I.; Levine, M. S. & MacGregor, S. (U Rochester) **Tonic and phasic effects evoked concurrently by sensory stimuli in hippocampal units.** *Experimental Neurology*, 1974(Jul), Vol 44(1), 130-134.—Phasic and tonic unit responses recorded from the anterior dorsal hippocampus of awake New Zealand white rabbits suggest that these responses represent separable response types because they varied in stability, presence, and magnitude. Data indicate that both auditory and visual stimuli evoke phasic excitatory responses in the hippocampus and should be investigated in paradigms similar to those employed with tonic responses.

450. Loveless, N. E. & Sanford, A. J. (U Dundee, Scotland) **Slow potential correlates of preparatory set.** *Biological Psychology*, 1974, Vol 1(4), 303-314.—11 experienced undergraduate Ss performed a simple reaction time task under the classical normal, sensory, and motor set instructions. Computer averaging of the EEG confirmed that slow potential changes during the foreperiod could be analyzed into 2 components: an orienting response following the warning signal, and an expectancy wave anticipating the reaction signal. The orienting response was not affected by instructions, but the amplitude of the expectancy wave was proportional to changes in the level of preparatory set as inferred from reaction time. Interaction between this effect and the intensity of the reaction signal suggests that the expectancy wave reflects shifts of the criterion governing the intensity required to initiate a response. Some methods of investigating this possibility are suggested. (30 ref)—*Journal abstract*.

451. Martindale, Colin & Armstrong, James. (U Maine, Orono) **The relationship of creativity to cortical activation and its operant control.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 311-320.—On the basis of theories and research on cognitive and perceptual processes, several hypotheses concerning psychophysiological differences between high- and low-creative Ss were made. 30 male undergraduates were divided into high- and low-creative groups on the basis of the Remote Associates Test and a version of the Uses test. Basal alpha index, alpha blocking in response to stimulus onset, and performance on alpha enhancement and suppression in a feedback situation were measured. High-creative Ss exhibited a lower alpha index and a greater decrement in alpha due to stimulus onset. High creatives showed immediate acquisition of control in

alpha enhancement trials but no improvement across trials, while low-creative Ss showed continual improvements and quickly reached the level of control of high-creative Ss. High creatives were much better at alpha suppression than at alpha enhancement. (43 ref)—*Journal abstract*.

452. Morris, Peter E. & Gale, Anthony. (Open U, Bletchley, England) **A correlational study of variables related to imagery.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 659-665.—Reports on an exploratory correlation study of a number of variables relating to imagery. The EEG of each of 32 undergraduate Ss was monitored during postobservation imaging to words varying in imagery. Ss then recalled the words and completed several questionnaires. The following significant correlations were obtained: (a) A. Paivio's I-rating of words and experienced imaging; (b) experienced imaging during the task and alpha abundance (EEG); (c) the Betts Test of Vividness of Imagery (QMI) and the Gordon Test of Visual Imagery Control; (d) the Betts QMI and incidental recall of words; (e) the Gordon test score and incidental recall; (f) the Betts QMI and extraversion; and (g) extraversion and alpha abundance. 2 interesting correlations which failed to reach significance were (a) Paivio's I-rating of words and alpha suppression, and (b) Paivio's I-rating of words and incidental recall. Both findings may be attributed to the effects of differential instruction to image. (18 ref)—*Journal abstract*.

453. Motokizawa, Fumiaki. (Gunma U, School of Medicine, Maebashi, Japan) **Electrophysiological studies of olfactory projection to the mesencephalic reticular formation.** *Experimental Neurology*, 1974(Aug), Vol 44(2), 135-144.—Analyzed single unit responses and field potentials of the mesencephalic reticular formation following olfactory stimulation in trigeminally deafferented, unanesthetized, and immobilized cats. Out of 167 units isolated, 97 units (58%) responded to odor stimulation. 2 major types of response—prolonged acceleration or reduction of the firing rate—were identified in these units. Both responsive and unresponsive units were distributed widely in the mesencephalic reticular formation and in the central gray matter. Reticular units could also be activated by electrical stimulation of the olfactory bulb. By applying single shocks to the olfactory bulb, field potentials were evoked from the prepyriform cortex, preoptic and posterior hypothalamic regions of the medial forebrain bundle ipsilateral to the stimulation, and bilaterally in the mesencephalic reticular formation. Following lesions of the medial forebrain bundle, the potentials induced from the olfactory bulb ipsilateral to the lesion were completely abolished. It is concluded that olfactory impulses project to the mesencephalic reticular formation through the medial forebrain bundle. (17 ref)—*Journal abstract*.

454. Murphy, J. T.; Kwan, H.; Mackay, W. A. & Wong, Y. C. (U Toronto, Ontario, Canada) **Evaluation of neuronal spike trains in neurophysiological experiments.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 313-315.—Describes a simple method of analysis of spike train data from single neurons which avoids loss of relevant information. Examples of its usefulness in

describing stochastic properties and in detecting nonstationarities are presented.

455. Nääätänen, Risto & Gaillard, Anthony W. (U Helsinki, Inst of Psychology, Finland) **The relationship between the contingent negative variation and the reaction time under prolonged experimental conditions.** *Biological Psychology*, 1974, Vol 1(4), 277-291.—Recorded vertex, frontal, and temporal contingent negative variations (CNVs) from 3 highly experienced Ss during the S<sub>1</sub>-S<sub>2</sub> interval of a prolonged simple reaction time (RT) task and correlated them with RTs obtained. Data were measured in 2 ways: objectively, by measuring the CNV by means of a computer; and less objectively, by measuring the CNV by means of a ruler from the computer-averaged graphs in the traditional manner. Several amplitudes, as well as the vertex, frontal, and temporal evoked potentials to S<sub>1</sub> and S<sub>2</sub>, were measured. No systematic relationship between different CNV measures and the RT could be observed. Whereas the amplitudes of the evoked potentials clearly habituated during the experimental session, the amplitudes of the CNV remained at their original values. (29 ref)—*Journal abstract*.

456. Perkel, Donald H. & Mulloney, Brian. (Stanford U) **Motor pattern production in reciprocally inhibitory neurons exhibiting postinhibitory rebound.** *Science*, 1974(Jul), Vol 185(4146), 181-183.—Suggests that pairs of neurons which inhibit each other can produce regular alternating bursts of impulses if they also exhibit postinhibitory rebound (PIR). Computer studies were conducted which show that stable patterns occur spontaneously in systems of pacemaker neurons with PIR, and can be triggered in systems of nonpacemakers without requiring tonic excitation. The repetition rates of these patterns were determined largely by the PIR parameters. The patterns resisted perturbation by phasic synaptic inputs, but could be modulated or turned off by tonic inputs. One pair of PIR neurons may be entrained by another pair with a different repetition rate to produce more complex firing patterns.—*Journal abstract*.

457. Shephard, Peter. **Chemoreception in the antennule of the lobster, *Homarus americanus*.** *Marine Behaviour & Physiology*, 1974, Vol 2(3), 261-273.—Results of recording responses by hook electrode from small nerve fibre bundles in the lobster antennular nerve show striking differences in response spectrum between the single and multiunit responses. Findings suggest the presence of 2 major classes of antennular chemoreceptor and suggest the idea that the antennules are the site of sensitive chemoreceptors mediating such distance chemoreception responses as are seen in trapping behavior. (15 ref)

458. Shucard, David W. & Callaway, Enoch. (National Jewish Hosp & Research Ctr, Psychophysiology Research Lab, Denver, CO) **Auditory evoked potential amplitude and variability: Effects of task and intellectual ability.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 284-294.—Studied the effect of stimulus uncertainty, attention, interstimulus interval, and amount of time in the experimental situation on the average auditory evoked potential in 2 groups of 8 19-29 yr old males separated according to differences in intellectual ability. Results indicate that in general,

evoked potential amplitude was greater (a) for the 1st part of the experimental test session compared with the later part, (b) for conditions requiring attention compared with nonattending conditions, (c) for the stimulus following the long (rather than short) interstimulus interval, and (d) for conditions of greatest stimulus uncertainty. Also, evoked potential variability was found to increase as amplitude increased. Evoked potential differences between experimental groups suggested divergence both in strategies employed and in effects of experimental conditions on these groups. (26 ref)—*Journal abstract*.

459. Spyer, K. M.; Ghelarducci, B. & Pompeiano, O. (U Pisa, Inst of Human Physiology, Italy) **Gravity responses of neurons in main reticular formation.** *Journal of Neurophysiology*, 1974(Jul), Vol 37(4), 705-721.—Studied the electrical activity of 810 units located in the bulbopontine reticular formation in decerebrate cats with or without the cerebellum, or in cats anesthetized with pentobarbital, and their responses to changes in the position of the head with respect to gravity. Data suggest that neurons in the bulbopontine reticular formation represent an important relay station through which the macular input may influence postural mechanisms and interact with both somatosensory and visual systems to compensate for the deviation of the head from the horizontal position. (63 ref)

460. Suzuki, Hisao & Takahashi, Masatsuga. (Hiro-saki U, Japan) **A method for single unit recording from the free-moving cat.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 331-334.—Describes a technique using chronically implanted microelectrodes, socket, and plug in the operantly behaving cat which greatly reduces the artifacts due to S movement. The device can be selectively connected with any of 8 leads to predetermined regions of the brain.

461. Torebjörk, H. Erik & Hallin, Rolf G. (U Uppsala Hosp, Sweden) **Responses in human A and C fibres to repeated electrical intradermal stimulation.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Jun), Vol 37(6), 653-664.—Recorded the responses of A and C fibers to electrical intradermal stimulation with microelectrodes inserted percutaneously into intact human skin nerves. Results suggest that not only central factors but also excitation failure in peripheral thin nerve fibers might be responsible for the decrease in pain perception experienced during local intense electrical intradermal stimulation at high frequencies. (23 ref)

462. Travis, T. A.; Kondo, C. Y. & Knott, J. R. (Southern Illinois U, School of Medicine, Springfield) **Personality variables and alpha enhancement: A correlative study.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 542-544.—Eysenck Personality Inventory (EPI) scores and EEG data from 45 students and university employees show that there was no consistent relationship between personality characteristics and amount of spontaneous alpha between trials and that Ss who scored high on the Neuroticism scale of the EPI showed more eyes-open alpha in the feedback setting than Ss with low scores. There were no differences on the Extraversion scale. (16 ref)

463. Walsh, David H. (VA Hosp, Psychophysiology Lab, Bedford, MA) **Interactive effects of alpha feed-**

**back and instructional set on subjective state.** *Psychophysiology*, 1974(Jul), Vol 11(4), 428-435.—Examined the reported subjective experiences of 40 undergraduate volunteers during EEG alpha feedback in a factorial "drug-drug set" design. Alpha and no-alpha feedback were each paired with alpha and neutral instructions, in order to observe the individual and combined effects of alpha activity and instructional set. Results show that for an "alpha experience" to occur, both alpha activity and alpha set are necessary; neither alone is sufficient. Theoretical considerations based on S. Schachter and J. E. Singer's (see PA, Vol 37:6064) drug model, and some implications for alpha feedback research are discussed. (24 ref)—*Journal abstract*.

464. Wyler, Allen R.; Fetz, Eberhard E. & Ward, Arthur A. (U Washington, Medical School) **Effects of operantly conditioning epileptic unit activity on seizure frequencies and electrophysiology of neocortical experimental foci.** *Experimental Neurology*, 1974(Jul), Vol 44(1), 113-125.—Rendered 5 male rhesus monkeys chronically epileptic by subpial injection of aluminum hydroxide in sensorimotor cortex. After stable seizure frequencies were documented, a recording mount was placed surgically; this operation caused a dramatic, but transient, decrease in seizures in all Ss. Subsequent periods of operant conditioning of interictal unit activity were associated with initially low levels of weekly seizure rates in 3 Ss. Even more consistent than the decrease in clinically apparent seizures was a steady decline in the number of abnormal neurons encountered. It is concluded that single cell operant conditioning was associated with a decrease in the proportion of single units exhibiting interictal burst activity but not consistently associated with a reduction of seizure frequency. (18 ref)—*Journal abstract*.

465. Yinon, U. & Auerbach, E. (Hadassah U Hosp, Vision Research Lab, Jerusalem, Israel) **Bursting patterns of neurons in the cat's visual cortex.** *Experimental Neurology*, 1974(Jul), Vol 44(1), 71-81.—Found, in 19 anesthetized adult cats, a distinct group of simple and complex cells in visual cortex which responded to a moving stimulus in a rhythmic or nonrhythmic series of spike bursts. Each burst consisted of 2-12 spikes, and 5-40 bursts were produced at each sweep. The regularity of the interburst intervals of rhythmic neurons depended on the velocity direction and orientation of the stimulus movement. From the single sweeps obtained for these neurons and their average response histograms, a further subdivision of the excitatory area of the receptive field is suggested. (21 ref)—*Journal abstract*.

### Physiological Processes

466. Ainslie, George W. & Engel, Bernard T. (Massachusetts Mental Health Ctr, Boston) **Alteration of classically conditioned heart rate by operant reinforcement in monkeys.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 373-382.—Ran 6 adolescent male rhesus monkeys alternately on classical conditioning and on operant heart rate training schedules. The classical unconditioned stimulus (UCS) was identical to the operant negative reinforcement. After operant training, some Ss changed their heart rate responses to the classical conditioned stimulus (CS).

When both the operant and the classical schedules were in force simultaneously, all Ss changed their previous heart rate responses to the classical CS without significantly changing their blood pressure responses to this stimulus. The changes in heart rate response to the CS sometimes persisted long after the operant schedules were no longer in force. These results show that a classically conditioned response can be altered by operant reinforcement, and they suggest that the classical UCS actually may be an operant reinforcer. (29 ref)—*Journal abstract*.

467. Beary, John F. & Benson, Herbert. (Boston City Hosp, Harvard Medical Unit, Thorndike Memorial & Channing Lab, MA) **A simple psychophysiological technique which elicits the hypometabolic changes of the relaxation response.** *Psychosomatic Medicine*, 1974(Mar), Vol 36(2), 115-120.—Found that oxygen consumption, carbon dioxide production, and respiratory rate were significantly decreased in 7 male and 10 female 18-37 yr olds during the practice of a new, easily learned relaxation technique. The elements of the technique were a mental device to prevent distracting thoughts, a passive attitude, decreased muscle tonus, and a quiet environment which was as free of visual and auditory stimuli as possible. Sitting quietly with the eyes either open or closed failed to produce the same changes. These physiologic changes are consistent with an integrated hypothalamic response resulting in hypothesized decreased sympathetic activity. This response has recently been termed the "relaxation response." (28 ref)—*Journal abstract*.

468. Boismier, James D.; Chappell, Patricia F. & Meier, Gilbert W. (U. Nebraska, Medical Center, Omaha) **Wakefulness and REM sleep in human neonates.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 304.—Recorded wake-sleep behaviors in white and black newborns on the 1st 3 days of life. The obtained relationship between alert inactivity and rapid eye-movement (REM) sleep was inverse, quadratic, strong, and homogenous across Sex, Age, and Race. REM sleep in neonates may be controlled in part by peripheral vision stimulation during wakefulness.

469. Booth, D. A. & Toates, F. M. (U Birmingham, England) **A physiological control theory of food intake in the rat: Mark 1.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 442-444.—Incorporated the theory that current supply of readily used energy is the primary control in feeding into a computer model of energy flows from the gut and to or from storage as fat. Values for all parameters were derived from physiological data. Meal patterns and cumulative food intakes were realistically predicted for normal and ventromedial hypothalamic-lesioned rats. (17 ref)

470. Boyce, P. R. (Electricity Council Research Ctr, Capenhurst, England) **Sinus arrhythmia as a measure of mental load.** *Ergonomics*, 1974(Mar), Vol 17(2), 177-183.—Conducted an experiment with 10 male graduate researchers involving a subtraction task in which the physical and mental loads could be varied independently. Results indicate that sinus arrhythmia decreased with an increase in mental load. However, heart rate could also be used to differentiate between the mental loads. In addition it was found that both heart rate and sinus

arrhythmia increased for an increase in physical load. This increase in sinus arrhythmia can be explained by the static work component of the physical load and of the scoring system used. It is concluded that changes in heart rate and sinus arrhythmia are best regarded as generalized responses to the imposition of a load.—*Journal abstract.*

471. Clausen, J.; Sersen, E. A. & Lidsky, A. (New York State Inst for Research in Mental Retardation, Staten Island) **Variability of sleep measures in normal subjects.** *Psychophysiology*, 1974(Jul), Vol 11(4), 509-516.—Examined the variability of sleep-stage percentages; sleep time; latency, duration, and cycle time of rapid-eye-movement (REM) sleep; number of REM periods; and number of eye movements (EM) in 10 17-30 yr old normal adults. During 4 nights of testing, no first night effect was found, except that EM showed significant increases across nights. Considerable inter- and intraindividual variability was apparent, with Stage 2 and REM yielding lowest variability coefficients. Between nights, consistent positive correlations were found for awake, REM, REM latency, and particularly for Stage 4 and EM. Consistency of the relationship between nights for the sleep stages was not generally improved by equating sleep time either within or between Ss. Within nights the 1st REM duration was the shortest, and the 1st non-REM duration the longest. In 25% of the records, Stage 3 terminated before Stage 4. Variability is discussed in terms of procedural aspects, trait characteristics, and situational factors. (25 ref)—*Journal abstract.*

472. Crowley, D. E. (Washington, U, Medical School) **Comments on otitis media in rats.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 125-128.—Summarizes observations of otitis media (OM) in rats obtained from commercial suppliers. Procedures for identifying OM are described. OM has been reported to occur in as many as 50% of some commercial rat populations. However, it should not be concluded that a high incidence of OM is characteristic of the laboratory rat in general. Likelihood of OM is high in the presence of respiratory disease; prevention of OM therefore requires isolation of the rat population from the pathogenic microorganisms causing respiratory disease. Various isolation regimens are described and their efficacy compared. The major factor in preventing OM is the exercise of meticulous standards of animal husbandry. Investigators using rats in auditory experiments should obtain veterinary consultation (including regular microbiological evaluation) and carefully examine each animal for OM. Prevailing practice in regard to OM detection should be stated in all research reports involving auditory investigation in rats.—*M. B. Meikle.*

473. Desiderato, Otello; MacKinnon, John R. & Hisson, Helene. (Connecticut Coll) **Development of gastric ulcers in rats following stress termination.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 208-214.—Observed gastric ulcer formation in groups of female albino Charles River unrestrained rats ( $N = 123$ ) sacrificed at varying intervals following the end of a single, 6-hr shock-stress session. Significant ulcer production was not found unless Ss experienced a minimum of 2 hr poststress rest

prior to sacrifice. Findings with appropriate control groups implicate the sudden reversal from stressful to "safe" (home cage) conditions, rather than delay per se, as the major ulcerogenic factor. (15 ref)—*Journal abstract.*

474. Fioretti, Maria C.; Riccardi, Carlo; Menconi, Emma & Martini, Luciano. (U Perugia, Inst of Pharmacology, Italy) **Control of the circadian rhythm of the body temperature in the rat.** *Life Sciences*, 1974(Jun), Vol 14(11), 2111-2119.—The circadian rhythm of body temperature was abolished in male Wistar rats kept either in constant dark or light or blinded. The rhythm was inverted by reversal of the lighting regimen and was unaffected by pinealectomy. It is noted that circadian rhythm probably is not related to changes in patterns of motor activity. (15 ref)

475. Frankenhaeuser, Marianne & Andersson, Karin. (U Stockholm, Psychological Lab, Sweden) **Note on interaction between cognitive and endocrine functions.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 557-558.—Examined relationships between learning rate and adrenaline output. Ability to learn nonsense syllables by the serial anticipation method was significantly superior for 6 high-adrenaline secreters to that of 6 low-adrenaline secreters. The difference in learning rate may reflect a direct effect of adrenaline on the brain.—*Journal abstract.*

476. Frazier, James R. (North Carolina Memorial Hosp, Div for Disorders of Development & Learning, Chapel Hill) **An exploratory attempt to define the components of activation.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1137-1138.—Factor analyzed a battery of physiological and behavioral measures (e.g., reaction time) given to undergraduate males in an attempt to identify components of the activation continuum. Following varimax rotation, 2 factors were interpreted and labeled as arousal factors, while a 3rd factor was identified as directed thinking within the visual modality.

477. Fri, Claes G.; Wiessel, Frits A. & Sedvall, Göran. (Karolinska Inst, Div of Neuropsychopharmacology, Stockholm, Sweden) **Simultaneous quantification of homovanillic acid and 5-hydroxyindoleacetic acid in cerebrospinal fluid by mass fragmentography.** *Life Sciences*, 1974(Jun), Vol 14(12), 2469-2480.

478. Hashimoto, Yuichi; Kurobe, Yoshiko & Hirota, Keizo. (Osaka Teishin Hosp, Japan) **Effect of delivery on serum dopamine- $\beta$ -hydroxylase activity and urinary vanillyl mandelic acid excretion of normal pregnant subjects.** *Biochemical Pharmacology*, 1974(Aug), Vol 23(15), 2185-2187.—Results of a study with 12 24-34 yr old human primiparas demonstrate that the emotional and physiological stress of delivery increased serum dopamine- $\beta$ -hydroxylase (DBH) activity and urinary excretion of vanillyl mandelic acid, and that the increase in serum DBH activity was the result of increased release of serum DBH from the sympathetic nervous system. (19 ref)

479. Hayes, R. W. (Birkbeck Coll, U London, England) **An oculo-cardiac factor in the heart rate deceleration component of the orientation response.** *Biological Psychology*, 1974, Vol 1(4), 315-320.—Briefly reviews some existing models dealing with the occur-

rence of heart-rate (HR) deceleration as a component of the orientation response (OR) and summarizes findings concerning the oculo-cardiac reflex. The HR deceleration component of the OR is reconsidered as possibly resulting from an ocular near-response OR causing an increase in intraocular pressure and thereby eliciting cardiac deceleration. This suggestion for a reflex link between oculomotor near-response activity and HR deceleration may have heuristic value in relating the cardiac OR to somatic mechanisms mediating attentive processes. It is pointed out that the existence of the near-response OR, the intraocular pressure OR, and the oculo-cardiac reflex has been empirically demonstrated, and that both the intraocular pressure OR and the near-response OR have been shown to occur with presentation of novel stimuli in all modalities, with a latency similar to that of the HR deceleration CR. 480. Jordan, Henry A.; Moses, Hamilton; MacFayden, Bruce V. & Dudrick, Stanley J. (U Pennsylvania) **Hunger and satiety in humans during parenteral hyperalimentation.** *Psychosomatic Medicine*, 1974(Mar), Vol 36(2), 144-155.—Observed 50 patients treated with iv hyperalimentation while receiving from 1,200-4,800 kcal/day via a central venous catheter. Ss were observed while receiving only iv nutrition and also while receiving nutrition by mouth as well as by vein. Assessment of degree of hunger and satiety were made and compared with records of body weight, temperature, blood sugar level, and amount and duration of iv nutrients. Most Ss reported hunger during therapy in spite of the iv calories. The onset of satiety was hastened by the iv nutrients, and although Ss would report mild to ravenous hunger while on iv nutrients alone, they were able to eat only small amounts of food when oral feeding was initiated. 4 Ss received iv fat emulsions in addition to the carbohydrate-amino acid solution. These Ss did not experience hunger during the 24-hr period after fat administration. (25 ref) —*Journal abstract.*

481. Kiritz, Stewart & Moos, Rudolf H. (Monterey Community Hosp, Carmel, CA) **Physiological effects of social environments.** *Psychosomatic Medicine*, 1974(Mar), Vol 36(2), 96-114.—Discusses recent studies which indicate the importance of settings or environmental variables in accounting for individual behavior. Measurement of the perceived social climate is a particularly promising way of investigating the psychosocial characteristics of diverse environments. 3 types of dimensions characterize and discriminate among environmental subunits: relationship, personal development, and system maintenance and system change dimensions. There is evidence that dimensions within each of these 3 categories have important effects on physiological processes. Individual and social environmental variables can interact, leading to differential physiological responses. Measurement of perceived social climate could provide a bridge between "objective" environmental stimuli and individual physiological responses, which are mediated by differences in perception, coping, and defense. Measurement might enable the general improvement of environments or the person-environment fit for specific groups of individuals. (91 ref)—*Journal summary.*

482. Lavie, Peretz; Lord, Jeri W. & Frank, Robert A. (U Florida) **Basic rest-activity cycle in the perception of the spiral after-effect: A sensitive detector of a basic biological rhythm.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 373-379.—Tested 8 16-17 yr old high school volunteers for 2 consecutive days on the spiral aftereffect from 4 PM to 12 midnight. 10 out of the 16 available time series revealed periodicities within the range of periodicities commonly reported for the rapid eye-movement (REM)-nonREM cycle. The close similarity between the 2 cycles supports N. Kleitman's idea (1963) that the REM-nonREM cycle is only part of a 24-hr biological rhythm operating during both sleep and wakefulness, which during nonsomnolent states is manifested in periodic alterations in alertness. (18 ref) —*Journal abstract.*

483. Lovallo, William & Zeiner, Arthur R. (U Oklahoma, Health Sciences Ctr) **Cutaneous vasomotor responses to cold pressor stimulation.** *Psychophysiology*, 1974(Jul), Vol 11(4), 458-471.—Tested the effect of cold pressor (CP) stimulation on cutaneous vasomotor activity in 2 experiments with a total of 56 university student Ss. In Exp I it was demonstrated that the decreased blood volume (constrictor) and increased blood volume (dilator) responses could not be attributed to differential response to instruction. A superimposed reaction-time task did not change ongoing response to CP. Exp II investigated the effects of levels of tonic activity upon response to CP stimulation by 2 methods: experimental manipulation of tonic level by shock and independent measurement of tonic sympathetic activity by pulse amplitude and skin conductance. Resting levels of pulse wave amplitude were significantly correlated with response to CP—the higher the amplitude, the greater the time to blood volume rebound. Results tentatively support the hypothesis that constrictors and dilators differ in sympathetic vasomotor tonus prior to cold pressor.—*Journal abstract.*

484. Lovenberg, Walter & Victor, Stephen J. (NIH, Section on Biochemical Pharmacology, Bethesda, MD) **Regulation of tryptophan and tyrosine hydroxylase.** *Life Sciences*, 1974(Jun), Vol 14(12), 2337-2353.—Reviews the literature showing that the synthesis of serotonin, norepinephrine, and dopamine is regulated by initial amino acid hydroxylases and that the level of tyrosine hydroxylase is regulated by transsynaptic induction. Acute regulation of in vivo hydroxylase activity appears to be by substrate availability in the case of tryptophan hydroxylase and possibly by feedback inhibition with tyrosine hydroxylase. "Receptor mediated feedback inhibition" of the activity of both tyrosine and tryptophan hydroxylase may also have an important role. (55 ref)

485. Lynch, James J.; Fregin, G. Frederick; Mackie, James B. & Monroe, Russell R. (U Maryland, Medical School, Inst of Psychiatry and Human Behavior, Baltimore) **Heart rate changes in the horse to human contact.** *Psychophysiology*, 1974(Jul), Vol 11(4), 472-478.—Explored the effects of human social contact on the electrocardiogram (EKG) and general behavior of 2 horses. Petting elicited a slowing of heart rate, while a person entering and exiting elicited transient but marked heart-rate increases. Transient periods of T-wave inver-

sion occurred in the EKG during human contact. In one of the Ss the frequency of dropped heart beats increased dramatically during successive trials of human petting. These findings parallel previous observations made with dogs. Similar observations of changes in the heart rate and rhythm of patients in coronary care units and a shock-trauma unit during social contact with other humans underscore the need to develop empirical analogs of these reactions. (21 ref)—*Journal abstract*.

486. McCarty, Richard & Richardson, John H. (Johns Hopkins U) **Adrenal response of female mice to variations in living space.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1267-1270.—Following weaning, 48 CFW and 48 CF-1 female mice were isolated for 7 days and randomly assigned to 1 of 3 cage sizes for an additional 7 days. There was a significant increase in adrenal weight and significant decrease in final body weights associated with decreased living space in CFW Ss. For CF-1 Ss however, variations in living space had no significant effects on adrenal or body weights. Results are discussed in relation to the effects of spatial parameters on the endocrine response to stress of all-female groups or mixed-sex populations. (16 ref)—*Journal abstract*.

487. Mohan, Chandra & Radha, E. (Bangalore U) **Circadian rhythm in acetylcholinesterase activity during aging of the central nervous system.** *Life Sciences*, 1974(Jul), Vol 15(2), 231-237.—Acetylcholinesterase activity rhythm was age-dependent in Wistar albino rats, being bimodal at 1 day and unimodal at 3 and 13 wks of age. At 44 and 87 wks the rhythms in medulla and cerebrum were similar, and in the optic lobes the rhythms shifted from bimodal at 44 wks to unimodal at 87 wks.

488. Obrist, Paul A. et al. (U North Carolina, Medical School, Chapel Hill) **Sympathetic influences on cardiac rate and contractility during acute stress in humans.** *Psychophysiology*, 1974(Jul), Vol 11(4), 405-427.—Measured heart rate and cardiac contractility in 36 normal university students during a stressful reaction-time task. During the preparatory interval only vagal influences on heart-rate change could be found which were related to concomitant somatic activity. In expectation of the shock, sympathetic influences became manifested on both heart rate and contractility which were independent of concomitant somatic activity. In a follow-up study, the relationship was evaluated between blood pressure, as measured directly from the radial artery, and both contractility and heart rate. Sympathetic influences on the heart were not secondary to depressor effects, although appreciable phasic decreases in blood pressure sometimes followed the onset of large increases in heart rate and contractility. Data suggest that sympathetic influences on the heart are normally very minimal but are evoked by intense stress when the organism attempts to cope with the stress. (30 ref)—*Journal abstract*.

489. Orem, John & Dement, William C. (Stanford U, Medical School) **Spontaneous eyelid behavior in the sleeping cat.** *Experimental Neurology*, 1974(Aug), Vol 44(2), 145-159.—Recorded movements of the eyelids in 5 adult cats to determine the nature of the closure process at sleep onset and whether or not the eye movements of rapid-eye-movement (REM) sleep are

accompanied by associated lid movements as in wakefulness. After 16 hrs of treadmill deprivation, lid movements were recorded in the chronically implanted and immobile Ss. Results reveal that closure was a complex process consisting of a series of simultaneous downward movements of the upper lid and upward movements of the lower lid and that this closure was an active process. At REM onset, the palpebral fissures widened as the lower lid underwent a slow descent to the open position. In REM there were also phasic twitches of the lids, predominantly upward twitches of the lower lids, and periods in which the upper lid demonstrated movements similar to the lid movements associated with waking eye movements. (22 ref)—*Journal abstract*.

490. Palmblad, Jan et al. **Stress and the human granulocyte: Phagocytosis and turnover.** *Reports from the Laboratory for Clinical Stress Research, Stockholm*, 1973(Dec), No 34, 15 p.—Evaluated physiological susceptibility to intense psychosocial stimuli by exposing 5 young women to a stressful 77-hr vigil. While hearing recorded battle noise at 95 db, they fired rifles at model tanks on an electronic shooting range with only 15-min breaks. During and after 3 days without rest, sleep, or stimulants, and with restriction of activities other than the assigned task, blood and urine samples revealed changes possibly related to endocrine mechanisms. Although bodily reactions to stress are probably complex and multifactorial, it is suggested that a start has been made toward future formulation and testing of hypotheses.—R. L. Sulzer.

491. Ray, William J. & Lamb, Susan B. (Pennsylvania State U) **Locus of control and the voluntary control of heart rate.** *Psychosomatic Medicine*, 1974(Mar), Vol 36(2), 180-182.—Selected 8 internal and 7 external male undergraduates using Rotter's Internal-External Control Scale. A 3-phase experiment was conducted with a 100-beat baseline preceding each phase. During Phases 1 and 3, Ss were instructed to increase or decrease their heart beats. During the 2nd phase, a biofeedback display was operative. Following each increase and decrease trial, Ss completed a questionnaire concerning strategies and a self-report affect scale. The average interbeat-interval of the 2 locus of control groups did not significantly differ. A significant Group  $\times$  Task interaction was found with the internal control Ss performing better on the increase and the externals better on the decrease of heart rate tasks ( $p < .05$ ). Implications for research in psychosomatic medicine are noted.—S. Knapp.

492. Silverman, Julian et al. (California Dept of Mental Hygiene, Agnews State Hosp, San Jose) **Stress, stimulus intensity control, and the structural integration technique.** *Confinia Psychiatrica*, 1973, Vol 16(3-4), 201-219.—Reports on the effects of the structural integration technique on measures of psychological and physiological function (several EEG averaged evoked response procedures, an eye-movement procedure, and a battery of biochemical tests). Inferences and conclusions from the data are based upon a relatively new biophysical model of how individuals modulate environmental stimulation. Changes after structural integration indicated increased openness and better modulated sensitivity to environmental stimulation.—*Journal abstract*.

493. Stolk, Jon M.; Conner, Robert L. & Barchas, Jack D. (Dartmouth Coll, Medical School) **Social environment and brain biogenic amine metabolism in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 203-207.—Investigated the effects of living alone or in groups of 3 or 4 wks on brain biogenic amine metabolism in 50 male Long-Evans rats. Living alone produced an increase in brain norepinephrine turnover relative to the grouped Ss. In addition, reserpine and *para*-chlorophenylalanine treatment affected brain norepinephrine levels more after individual housing than after group housing. Brain serotonin metabolism showed minimal changes in differentially housed Ss. These findings are in direct contrast to results from studies on psychosocial determinants of brain amine metabolism in mice.—*Journal abstract*.

494. Szechtman, Henry; Lambrou, Peter J.; Caggiula, Anthony R. & Redgate, Edward S. (U Pittsburgh) **Plasma corticosterone levels during sexual behavior in male rats.** *Hormones & Behavior*, 1974(Jun), Vol 5(2), 191-200.—Determined the activity of the pituitary-adrenal (P-A) system, as reflected in plasma levels of corticosterone, in 14 male Long Evans rats during copulation, exposure to an open field, and in control conditions. Plasma corticosterone concentration during copulation was higher than in control conditions but well below mean levels obtained in the open field. Some males gave no evidence of P-A activation during sexual activity. Ss which showed increased steroid levels during copulation tended to have longer latencies to reinitiate copulation after ejaculation and were behaviorally less active in a subsequent open field test. It is suggested that neither sexual arousal nor copulatory performance necessarily activates the system. Males showing P-A activation may be slow to habituate to a novel stimulus and thus the elevated steroid levels may reflect an insufficient number of habituation trials with the receptive female. (29 ref)—*Journal abstract*.

495. Thompson, Joseph J. & Dixon, Paul W. (U Hawaii, Hilo) **A power function between ratings of pornographic stimuli and psychophysical responses in young normal adult women.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1236-1238.—Presented 13 pornographic pictures to 10 18-34 yr old women with normal MMPI profiles. A galvanic skin response instrument was used to record psychophysical responses to the stimulus pictures, and stimuli were rank-ordered by Ss according to how Ss reacted to them. Algebraic averages were computed and plotted on log-log paper, and power function was obtained between galvanic skin responses and rank order of these stimuli.

496. Van Twyver, H. & Allison, T. (Florida Technological U) **Sleep in the armadillo *Dasypus novemcinctus* at moderate and low ambient temperatures.** *Brain, Behavior & Evolution*, 1974, Vol 9(2), 107-120.—A study of 13 armadillos indicates that paradoxical sleep (PS) can occur at low body temperatures in a placental mammal. Polygraphic characteristics of waking, slow-wave sleep, and PS were in general typically mammalian. Ss spent over 17 hr/day asleep, with 18% of the time in PS. (23 ref)—*Journal abstract*.

497. Young, Larry D. & Blanchard, Edward B. (U Mississippi, Medical Ctr) **Effects of auditory feedback of**

**varying information content on the self-control of heart rate.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 61-68.—Determined the relative efficacy of auditory feedback, varying in the amount of information contained in the feedback signal, for the self-control of heart rate (HR) by comparing 5 groups of 10 graduate and undergraduate students who received either (a) continuous proportional feedback, (b) discontinuous proportional feedback, (c) binary feedback, (d) heart sounds, or (e) no feedback. At each of 2 sessions Ss were given 8 trials in each direction on which they were to raise or lower their HR. Without regard to the amount of information contained in the signal, presentation of auditory feedback aided Ss in raising HR relative to Ss who received no feedback; however, feedback did not yield an advantage in lowering HR. Results suggest that the informing quality of feedback may be multidimensional and that the mechanisms involved in acceleration and deceleration of HR may be different.—*Journal abstract*.

498. Zimmerberg, Betty; Glick, Stanley D. & Jerussi, Thomas P. (Mount Sinai School of Medicine, City U New York) **Neurochemical correlate of a spatial preference in rats.** *Science*, 1974(Aug), Vol 185(4151), 623-625.—Determined spatial (left or right) preferences for female albino Sprague-Dawley rats given foot shock in a T maze. The animals were killed, and left and right striata were assayed separately for dopamine and left and right telencephalic regions were assayed for norepinephrine. Dopamine content was significantly higher (by 12%) in the striata contralateral to Ss' side preferences than in the ipsilateral striata; there was no such difference for telencephalic norepinephrine. The small asymmetry in striatal dopamine content is not due to any learning- or stress-related change induced by the testing procedure but is probably inherent in normal rats. Some spatial behavior appears to be the manifestation of a normal and specific difference in the activity of left and right nigrostriatal systems.—*Journal abstract*.

## Genetics

499. Breland, Nancy S. (Trenton State Coll) **A test of a primary bias in twin studies with respect to measured ability.** *Behavior Genetics*, 1974(Jun), Vol 4(2), 101-109.—Discusses the suggestion that the twin method for investigating hereditary and environmental sources of variation in measured traits is biased by the unique prenatal environments of identical twins. Monozygotic (MZ) twins derived from eggs which split into 2 individuals early in their prenatal development, indicated by concordant handedness within sets, most likely develop with separate placentas, chorions, and amnions. Later-splitting eggs, indicated by discordant handedness within MZ pairs, more likely produce twins who share the same placenta, chorion, and amnion, and experience more severe prenatal competition. Greater prenatal competition was hypothesized to produce greater twin differences in measured ability. A group of 482 sets of MZ twins who took the National Merit Scholarship Qualifying Test (NMQST) in 1962 were used to test this hypothesis. No difference between handedness groups on the set of NMQST scales was found, indicating that the unique prenatal environment of MZ twins does not

appreciably bias heritability estimates of ability. (16 ref)

500. Burnet, Barrie; Connolly, Kevin & Mallinson, Mary. (U Sheffield, England) **Activity and sexual behavior of neurological mutants in *Drosophila melanogaster*.** *Behavior Genetics*, 1974(Sep), Vol 4(3), 227-235.  
—Observations show that the neurological mutants *Hyperkinetic* and *Shaker* in *Drosophila melanogaster* differed quantitatively in their patterns of behavior from the wild type. Differences were apparent during the preimaginal stages, when the mutants showed a reduction in the rate of larval feeding. Adult mutants exhibited a lower rate of sustained locomotor activity; they frequently made jumps or short flights and then fell over. Unlike *Shaker* flies, the *Hyperkinetic* mutants had difficulty in regaining equilibrium after falling over and thrashed about in a disorganized manner. The mutants differed significantly in mean duration of dyskinesia. *Shaker* mutant males did not differ significantly in mating speed from wild type. *Hyperkinetic* males tended to switch rapidly from one behavior to another and showed a marked reduction in mating speed caused by frequent loss of contact with the females during courtship.—*Journal abstract.*

501. Eaves, L. J. & Gale, J. S. (U Birmingham, England) **A method for analyzing the genetic basis of covariation.** *Behavior Genetics*, 1974(Sep), Vol 4(3), 253-267.—Notes that covariances between traits can be partitioned into additive and dominance genetic components and between- and within-family environmental components, using a method analogous to that used in the analysis of single traits. The problem arises as to whether all additive genetic components simply reflect a single additive component in the sense that, given an appropriate rescaling of the breeding values, a single additive genetic component would adequately describe the additive genetic variation. The statistical procedure for testing this hypothesis is discussed in detail. The approach is applied to twin data given by J. C. Loehlin and S. G. Vandenberg (1968) on covariation between 5 of Thurstone's Primary Mental Abilities. Although the data do not permit a reliable separation of additive and dominance components, it is shown that a single genetic component will account for almost all the genetic variation and covariation. Unless there is marked linkage disequilibrium, this implies that most of the genetic variation for the 5 traits can be attributed to the pleiotropic action of genes at a common set of loci. (16 ref)—*Journal abstract.*

502. Festing, Michael F. (MRC Lab Animals Ctr, Carshalton, England) **Water escape learning in mice: III. A diallel study.** *Behavior Genetics*, 1974(Jun), Vol 4(2), 111-124.—Used a  $5 \times 5$  diallel cross to investigate the mode of inheritance of water escape learning in mice. Strains C3H and ICFW had a poor learning performance, while strains DBA/1, CBA-T6, and C57BL/10ScSn improved their performance markedly in successive trials. There was evidence for heterosis and reciprocal cross effects but no evidence for sex differences. General combining ability was low, but specific combining ability was high. Heritability was calculated as .07 (narrow sense) and .73 (broad sense). Variance-covariance analyses indicated a dominant to overdominant

polygenic mode of inheritance with no epistasis, although males showed less dominance and less variation between strains than did females. The most recessive genes were carried by the strains with a poorer learning performance (i.e., ICFW and C3H). (23 ref)—*Journal abstract.*

503. Gallup, Gordon G. (Tulane U) **Genetic influence on tonic immobility in chickens.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 145-147.—80 Production Red chickens were selectively bred on the basis of having shown prolonged or brief immobility reactions at 21 days of age. After only 1 generation, there was sufficient separation between offspring to conclude that tonic immobility has an unusually large heritability component. Results are discussed in terms of their implications for an evolutionary model of animal hypnosis.

504. Guttman, Ruth. (Hebrew U, Jerusalem, Israel) **Genetic analysis of analytical spatial ability: Raven's Progressive Matrices.** *Behavior Genetics*, 1974(Sep), Vol 4(3), 273-284.—Administered the Progressive Matrices test to members of 100 families, including parents, children, and first cousins. Scores varied with age and sex; males' scores were consistently higher than females' scores. Correlations between parents and children were zero for subtests A and B, .19 for C, .30 for D, .22 for E, and .41 for the total test score. Between-mate correlations ranged from zero to .30 on the different subtests. Full-sibling intraclass correlations were .14, .09, .19, .18, and .30 for subtests A-E and .22 for total test score; first-cousin correlations were lower but had the same relative order of size. 12 items gave parent-offspring correlations of .2 and higher. Of these, 1 item, E-8, had a father-son, father-daughter, mother-son, mother-daughter correlational pattern in accordance with a hypothesis of X linkage. It is suggested that differences in levels and/or patterns of intrafamily correlations may sometimes discriminate between items that test different aspects of the problem-solving process. It is suggested that a genetic analysis of a battery of items which are specially designed to test specific elements of this process could lead to the definition of specific abilities and to an elucidation of the mode of inheritance of some of these abilities. (26 ref)—*Journal abstract.*

505. Hegmann, J. P.; Kleso, R. A. & Hartman, H. B. (U Iowa) **Gene differences influencing visual system function and behavior.** *Behavior Genetics*, 1974(Jun), Vol 4(2), 165-170.—Behavioral differences between albino (cc) and pigmented (C-) mice were mimicked by mice homozygous for a recessive allele (p) 13 map units from the c locus. Electoretinograms for cc and dilute pigment (pp) Ss were similar, showing greatly enhanced a- and B-waves compared to normals (C-). A total of 336 Ss were observed. The behavioral and retinal physiology similarities of cc and pp mice probably result from increased sensitivity to illumination. Recently reported decreased ipsilateral retinogeniculate projections characteristic of cc animals may result from genotype-visual environment interactions rather than from pleiotropic effects of the c locus.—*Journal abstract.*

506. Heinze, William J. (U Illinois, Medical Ctr, Ctr for Genetics, Chicago) **A genetic analysis of escape behavior in rats.** *Behavior Genetics*, 1974(Jun), Vol 4(2),

125-131.—Tested 3 strains of highly inbred rats (B, I, and J) and their derived F<sub>1</sub> hybrid progeny (BI, BJ, and IJ) for escape latencies in a novel test situation at 3 ages (30, 60, and 90 days). Highly significant differences were found in escape latencies between genotypes and between ages. There was also a very highly significant Genotype  $\times$  Age interaction; the inbreds had increasing latencies with increasing age, whereas the hybrids did not. Heterosis was observed, and it is concluded that this behavioral heterosis was consistent with the hypothesis of selection for an intermediate optimum in latency to escape. (16 ref)—*Journal abstract*.

507. Insel, Paul M. (Stanford U, Medical School) **Maternal effects in personality.** *Behavior Genetics*, 1974(Jun), Vol 4(2), 133-143.—Examined a sample of 98 families consisting of 589 Ss and composed of 3 generations, on 3 personality dimensions using Eysenck's Psychoticism-Extraversion-Neuroticism Inventory and the Junior Personality Inventory. In addition, each family was administered the Conservatism Scale and Conservatism Scale for Children to measure social attitudes and social desirability. Results indicate significant correlations between mother-child scores and maternal-grandparent-child scores on personality variables but low nonsignificant correlations between father-child scores. Results suggest the presence of maternal effects on personality dimensions. (23 ref)—*Journal abstract*.

508. Kekić, Vladimir & Marinković, Dragoslav. (Inst for Biological Research, Belgrade, Yugoslavia) **Multiple-choice selection for light preference in *Drosophila subobscura*.** *Behavior Genetics*, 1974(Sep), Vol 4(3), 285-300.—Selected *Drosophila subobscura* flies for the ability to choose 1 of 5 light intensities with the aid of an apparatus which enabled the Ss to choose freely. The original distribution of wild flies was as follows: about 60% repeatedly chose the space lighted by 6,500 lx, about 30% chose the 1,300-3,200 lx, and about 10% chose the 30-300 lx. By mating the flies within each of the 3 categories for 19 generations, their proportion increased from 8 to 30% at 30-300 lx, from 32 to 55% at 1,300-3,200 lx, and from 60 to 78% at 6,500 lx. The selective response was greatest at the beginning of the selection, and declined later. Using micronized dusts to mark the Ss, it was determined that on the average about 33% chose the same light intensity in both of 2 24-hr runs, and about 31% more chose for the 2nd time 1 of the neighboring light intensities. Results suggest that phototactic response is a relative property, so that a fly can be "photopositive" or "photonegative" to a dimmer light (including complete darkness) and to a light of much higher intensity. (37 ref)—*Journal abstract*.

509. Klein, Thomas W. (U California, Davis) **Heritability and genetic correlation: Statistical power, population comparisons, and sample size.** *Behavior Genetics*, 1974(Jun), Vol 4(2), 171-189.—Discusses statistical power as it relates to estimates of heritability and genetic correlation, particularly with reference to population comparisons. Power tables  $\alpha = .05$  are presented for estimates of heritability and genetic correlation for 4 research designs (the regression of offspring on midparent values, the regression of offspring on single-parent values, the intraclass correlation of full siblings, and the

intraclass correlation of half siblings) as a function of sample size. In addition, tables of statistical power for the comparison of heritabilities obtained from 2 different populations, using these 4 methodologies, are presented. These tables indicate that for the study of a single population, 400 families of 4 members each is a sufficient sample to achieve a statistical power in excess of 95% for a heritability estimate of .20. However, in the comparison of heritabilities from 2 populations, 800 families of 4 members each (measured in each population) would be required to achieve equivalent statistical power for a difference in heritability of .20.—*Journal abstract*.

510. Lykken, D. T.; Tellegen, A. & Thorkelson, K. (U Minnesota) **Genetic determination of EEG frequency spectra.** *Biological Psychology*, 1974, Vol 1(4), 245-259.—Collected simultaneous EEG samples under 4 conditions in 1 session from 39 pairs of monozygotic (MZ) and 27 pairs of dizygotic (DZ) young adult twins of the same sex. The 3-min EEG samples were spectrum analyzed, and root mean square differences between pairs of spectra were computed for the 2 twin samples and for a group of unrelated pairs obtained from the same samples. 6 parameters were defined to characterize the salient features of the individual spectra: delta, theta, alpha, beta, phi (alpha mid-frequency), and kappa (stability of alpha frequency). All 6 parameters showed intraclass correlations of about .8 for the MZ twins and correlations near zero for the DZ pairs. Comparisons across conditions indicated that, with respect to EEG spectra, the MZ twins resembled their cotwins about 96% as much as they resembled themselves. Holding time and situation constant, most of the variance in the frequency characteristics of the EEG appears genetically determined. (17 ref)—*Journal abstract*.

511. Marinković, Dragoslav. (U Belgrade, Faculty of Science, Yugoslavia) **Light dependence in matings of *Drosophila pseudoobscura*.** *Behavior Genetics*, 1974(Sep), Vol 4(3), 301-303.—Mating in *Drosophila pseudoobscura* is known to be light independent. However, results of an experiment indicate that differences in the ability to mate in the presence of light or in the dark exist in lines selected for positive or for negative phototaxis.

512. Perry, Arnon. (Tel-Aviv U, Leon Recanati Graduate School of Business Administration, Israel) **Heredity, personality traits, product attitude, and product consumption: An exploratory study.** *Journal of Marketing Research*, 1973(Nov), Vol 10(4), 376-379.—Investigated the extent to which the attitude toward and the consumption of alcohol, cigarettes, and coffee can be explained by genetic factors, and to what extent heredity is a link between 2 personality traits (anxiety and introversion-extraversion) and the attitude and consumption of the 3 products. 46 monozygotic and 38 dizygotic pairs of 16-31 yr old twins completed an attitude and degree of consumption questionnaire on cigarettes, alcohol, and coffee; the Eysenck Personality Inventory; and Bendig's short form of the Taylor Manifest Anxiety scale. Attitude demonstrated no significant genetic component for the 3 products or for any combination of variables. No genetic component was found for the 2 personality traits. A significant genetic component, however, was found in consumption

of all 3 products, as well as in the combination of cigarettes and anxiety, cigarettes and alcohol, and cigarettes and coffee. (29 ref)—*L. Gorsey.*

513. **Plomin, Robert J. & Manosevitz, Martin.** (U Texas, Austin) **Behavioral polytypism in wild *Mus musculus*.** *Behavior Genetics*, 1974(Jun), Vol 4(2), 145-157.—Raised offspring of wild Texas and Colorado mice under standard laboratory conditions and tested them as adults for (a) activity, defecation, climbing latency, and jumping in the open field; (b) running-wheel activity; (c) nest-building behavior; (d) temperature preference; and (e) cold and heat stress. Differences among the 2 Texas samples and the Colorado sample were found for all but the last 2 measures. A preliminary attempt was made to assign these behavioral differences to genetic drift or natural selection on the basis of intra- vs interregional differences among the groups. Comparison of data obtained from wild mice with data from inbred and random-bred mice run in the same laboratory with the same apparatuses suggests that wild mice jump much more in the open field and are considerably more active in the open field and in the running wheel than inbred and random-bred laboratory strains.—*Journal abstract.*

514. **Streng, John.** (Free U, Amsterdam, Netherlands) **Exploration and learning behavior in mice selectively bred for high and low levels of activity.** *Behavior Genetics*, 1974(Jun), Vol 4(2), 191-204.—Conducted 2 experiments with 144 mice (BALB/c and C57BL/6 crossed strains). In Exp I, Ss' behavior in the open field was classified at 3-sec intervals for 20 min, into 1 of 6 categories: air sniffing, rearing, grooming, locomotion, sniffing at objects, and freezing. Selective breeding was very effective in changing the behavioral profile of the selected Ss when compared to the control stock. The behavior of the inactive Ss was characterized by more passive exploration which became less pronounced as the observation period progressed. It was hypothesized in Exp II that the selectively bred Ss would also differ with respect to their learning behavior. No differences were found between the active and inactive Ss in wheel-turn avoidance learning. Inactive Ss were significantly slower than the active Ss in running through a Lashley III maze, but there were no significant differences in the number of errors made. It is concluded that learning and exploratory behavior are not related in any simple manner in the mouse.—*Journal abstract.*

## PSYCHOPHARMACOLOGY AND PHYSIOLOGICAL INTERVENTION

515. **Anders, Thomas F. & Chalemian, Robert J.** (Children's Hosp, Buffalo, NY) **The effects of circumcision on sleep-awake states in human neonates.** *Psychosomatic Medicine*, 1974(Mar), Vol 36(2), 174-179.—Assessed the effect of circumcision on the proportion of subsequent sleep-awake states in 11 normal, full-term male neonates. It was proposed that, as had been previously suggested, the proportion of quiet sleep would be increased as a response to this "procedure." Results demonstrate that no quiet sleep state shifts were present in the immediate hour after circumcision; instead,

significant increases in the proportion of wakefulness were noted, suggesting that later quiet sleep state shifts, if present, may be secondary to changes in wakefulness.—*Journal abstract.*

516. **Baum, M. J.; Södersten, P. & Vreeburg, J. T.** (Erasmus U, Rotterdam, Netherlands) **Mourning and receptive behavior in the ovariectomized female rat: Influence of estradiol, dihydrotestosterone, and genital anesthetization.** *Hormones & Behavior*, 1974(Jun), Vol 5(2), 175-190.—Conducted 2 experiments with 24 female hooded and 40 female Wistar ovariectomized rats to determine whether estradiol benzoate (EB) and dihydrotestosterone (DHT) work synergistically in the brain to activate mourning behavior. In Exp I, Ss treated daily with 2 µg EB combined with 500 µg DHT displayed significantly more mounts with pelvic thrusting than other females treated with the oil vehicle, 500 µg DHT, or 2 µg EB. The behavior of Ss receiving EB + DHT was indistinguishable from that of another group of females which received 200 µg testosterone propionate (TP). In Exp II, ovariectomized female rats treated with either 200 µg TP or 2 µg EB + 200 µg dihydrotestosterone propionate (DHTP) mounted significantly more than females treated with 2 µg EB. Both clitoral size and the growth of cornified papillae on the glans clitoris were stimulated by the administration of TP or EB + DHTP. However, in no group was the frequency of mounting affected by anesthetization of the clitoris and external vagina with lidocaine paste. Lordosis quotients of females treated with EB + DHTP were significantly lower than in rats receiving either EB or TP, again regardless of whether or not the genital region was anesthetized. (40 ref)—*Journal abstract.*

517. **Davidson, Julian M. & Smith, Eria R.** (Stanford U, Medical School) **Gonadotropin release as a function of mating and steroid feedback in the female rat.** *Hormones & Behavior*, 1974(Jun), Vol 5(2), 163-174.—Studied relationships between mating-induced and steroid-induced luteinizing hormone (LH) release in 63 spayed Long-Evans rats. Large amounts of LH were released approximately 7 hrs following progesterone injection in rats primed with estradiol benzoate (EB). The amount of LH release varied widely depending on (a) the interval between the time of the progesterone injection and the EB priming, (b) the progesterone dose, and (c) the time of day when blood samples were collected. Females, prepared with estrogen-progesterone treatment in a variety of schedules in which these 3 variables were altered systematically, were allowed to mate with vigorous males. Mating did not significantly increase plasma LH levels even when the females showed high degrees of sexual receptivity. Sodium pentobarbital prevented the afternoon LH rise resulting from progesterone treatment 3 days after EB priming. Pituitary sensitivity to LRF was not enhanced in the afternoon, and the mating did not significantly increase plasma LH in these barbiturate-blocked rats. Following administration of 5 large daily doses of EB without progesterone, however, significant increases in LH were produced by mating on the 6th day. Postcopulatory LH release in these circumstances was dependent on a diurnal factor since the effect of mating was greater in the afternoon than in the morning. (27 ref)—*Journal abstract.*

518. Diamond, Milton; Mast, Marian & Yanagimachi, Ryuzo. (U Hawaii, Medical School) **Reproductive development and induced estrus in the prepubertal hamster. *Hormones & Behavior*, 1974(Jun), Vol 5(2), 129-133.**—Investigated the lordosis capability as a possible limiting factor in the initiation of puberty. 60 intact and 40 castrate female golden hamsters at 18-28 days of age were capable of demonstrating an adult-like lordosis response when primed with estrogen and progesterone. This is before ovulation or hypothalamic cyclicity usually occur. Estrous behavior appears to be one of the first reproductive capabilities to mature. Early ovariectomy seems to delay the development of the tissues mediating lordosis. Ovarian maturation is probably the crucial limiting factor for puberty in the hamster. —*Journal abstract.*

519. DiCara, Leo V. & Wilson, Linda M. (U Michigan, Mental Health Research Inst) **Role of gustation in sodium appetite. *Physiological Psychology*, 1974(Mar), Vol 2(1), 43-44.**—Studied the relative effects of sodium repletion via ingestion and via gastric intubation upon the satiation of sodium appetite in 24 albino rats subjected to sodium depletion for the 1st time. Compared to glucose or sham intubation, sodium intubation had no short-term satiating effect, whereas prior ingestion of sodium resulted in complete satiation of sodium appetite. Results support the idea that gustatory signals are critical for regulation of sodium intake. —*Journal abstract.*

520. Galosy, Richard A. & Howard, James L. (U North Carolina, Child Development Inst., Chapel Hill) **Acute and chronic peripheral nerve stimulation: Surgical preparation and electrode design. *Behavior Research Methods & Instrumentation*, 1974(May), Vol. 6(3), 332-334.**

521. Hendricks, Shelton E. & Duffy, John A. (U Nebraska, Omaha) **Ovarian influences on the development of sexual behavior in neonatally androgenized rats. *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 297-303.**—Studied female sexual behavior in 191 male and female Harlan-Wistar rats. Males were castrated on the day of birth (Day 1). Some males received ovarian implants at that time; others were injected on Day 3 with oil, 5 µg of testosterone propionate (TP), or 50 µg of TP. Females were ovariectomized at birth, 20 days, or 60 days of age; on Day 3 all were injected with oil, 5 µg of TP, or 50 µg of TP. Prepubertal ovarian tenancy in females tended to counteract the effects on sexual receptivity of TP administered during neonatal life. In males, ovarian implants facilitated female sexual behavior at adulthood in oil-injected Ss, but did not significantly influence the effect on neonatally injected TP. —*Journal abstract.*

522. Hughes, B. O. & Wood-Gush, D. G. (Agricultural Research Council, Poultry Research Centre, Edinburgh, Scotland) **An increase in activity of domestic fowls produced by nutritional deficiency. *Animal Behaviour*, 1973(Feb), Vol. 21(1), 10-17.**—Results of 5 experiments show that groups of pullets deprived of calcium in large cages exhibited significant increases in spontaneous activity and engaged in an aberrant behavior pattern—air pecking. The fact that a similar increase in activity was seen under sodium deprivation suggests that

the phenomenon may be of more general occurrence. (21 ref)

523. Lazarus, John & Crook, John H. (U Newcastle-Upon-Tyne, England) **The effects of luteinizing hormone, oestrogen and ovariectomy on the agonistic behaviour of female *Quelea quelea*. *Animal Behaviour*, 1973(Feb), Vol. 21(1), 49-60.**—Previous work with male *Quelea* showed that agonistic behavior in relation to individual distance is controlled by luteinizing hormone (LH) rather than by testosterone, and that male birds are more aggressive than females. The present 4 experiments with female *Quelea* groups show that (a) LH injections increased encounter frequency, (b) ovariectomy in the breeding season increased encounter frequency, and (c) estrogen injections decreased encounter frequency. The effects of LH were specific to agonistic responses rather than mediated through changes in activity. Correlations between changes in natural hormone levels and encounter frequency support the injection findings. Results are consistent with the hypothesis that LH controls aggressive encounters over individual distance in the female as in the male and that estrogenic inhibition of this LH-mediated aggressiveness is a cause of female subordination and the lower encounter frequency found in female groups. (20 ref)—*Journal abstract.*

524. Lee, C. T. & Naranjo, J. N. (Brooklyn Coll, City U New York) **The effects of castration and androgen on the social dominance of BALB/cJ male mice. *Physiological Psychology*, 1974(Mar), Vol 2(1), 93-98.**—Studied the relationship between androgen and the maintenance of social dominance in BALB/cJ male mice. Exp I revealed that 9 out of 10 dominant Ss lost their dominant positions after castration, but of the 10 sham-operated dominant Ss, 9 remained dominant. Thus, androgen appears to be necessary for the maintenance of social dominance. In Exp II, III, and IV varying amounts (.8-8 mg) of testosterone propionate (TP) were injected into castrated dominant Ss, but the hormone did not restore their precastration dominance in any dosage. The relationship between androgen and social order is discussed. (34 ref)—*Journal abstract.*

525. Liebeskind, John C. & Dearmore, Darrell C. (U California, Los Angeles) **A simple, multi-purpose animal preparation for use in a psychobiology laboratory course. *Behavioral Biology*, 1974(Jul), Vol 11(3), 423-428.**—Demonstrates ways in which rats chronically prepared with single, bipolar electrodes in caudal midbrain central gray matter can be used in successive weeks to demonstrate to laboratory course students: sensory evoked potentials in anesthetized and unanesthetized preparations, self-stimulation and/or escape, and stimulation-produced analgesia to peripheral pain. The preparation and procedures are simple, and accuracy in electrode placement is enhanced by the proximity of this structure to stereotaxic zero. Using the same animal repetitively minimizes time spent in surgical preparation and postsurgical recovery. The central gray matter is a relatively unexplored region, and studying it can lead to original observations. —*Journal abstract.*

526. Pittman, James C. & Feeney, Dennis M. (U New Mexico) **Modulation of recurrent inhibition in cat association cortex by reticulocortical arousal. *Experimental Neurology*, 1974(Aug), Vol 44(2), 160-170.**—Used

lesion-induced degeneration and single unit techniques to study the effects of reticular arousal and antidromic callosal stimuli on middle suprasylvian gyrus neurons in the cat. In acute experiments done 2 wks to 6 mo after ablation of the contralateral homotypical cortex in 9 Ss, most neurons showed inhibitory responses to 400-Hz callosal volleys. 5 unoperated Ss served as controls. Excitatory reticular stimulation 300 msec prior to the callosal stimulus increased the duration of the antidromic callosal inhibition. Data are interpreted in terms of recurrent inhibitory circuits in association cortex. (29 ref) —*Journal abstract.*

527. Schmid, Horst. (U Vienna, Psychological Inst, Div of Experimental & Applied Psychology, Austria) **[Conditioning of a relative alpha- and gamma-globulin increase in the serum of rats.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1972, Vol 4(1), 281-305.—Conducted experiments with 108 male, pathogen-free rats of equal age and weight to determine whether alpha and gamma globulin in the serum could be increased by conditioning. Ss were divided into an experimental group of 36, and 3 control groups of 24 each. Experimental Ss were exposed to 10 sessions of extreme stress—a muscular trauma caused by being rotated for 5-min periods at 60 rpm in a Noble-Collip drum. A neutral complex stimulus of light and sound was presented simultaneously. The puncture was done 6 hrs after the conditioning sessions. The 3 control groups were examined for (a) adjustment to the stress administered without simultaneous neutral stimulus, (b) reaction to the puncture itself without other stimuli, and (c) reaction to the neutral stimulus alone. The conditioning appeared to be successful; the neutral stimulus presented by itself produced a relative increase in the alpha-globulin content in the serum, and a relative increase in gamma globulin was also observed. (English summary) (3 p ref) —*T. Fisher.*

528. Sobotka, Thomas J. & Cook, Michelle P. (US DHEW, Food & Drug Administration, Washington, DC) **Postnatal lead acetate exposure in rats: Possible relationship to minimal brain dysfunction.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 5-9.—Male Sprague-Dawley rats receiving oral doses of lead acetate during their 3-wk postnatal development exhibited pharmacobehavioral characteristics similar to those of the minimally brain-dysfunctioned child: altered responsiveness to amphetamine, poor learning performance, and alleviation of this poor performance by amphetamine treatment. Data suggest that prenatal lead exposure may be etiologically related to variants of minimal brain dysfunction.

529. Stern, Judith M. (Rutgers State Coll, New Brunswick) **Estrogen facilitation of progesterone-induced incubation behavior in castrated male ring doves.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 322-337.—Previous studies have shown that incubation is shared by both male and female ring doves and is induced, without prior participation in courtship and nest building, by progesterone (100  $\mu$ g/day) treatment. In the present experiment with 52 mature male ring doves, it was shown that the effectiveness of progesterone is markedly reduced by castration and restored after estradiol benzoate (200  $\mu$ g/day  $\times$  14)

pretreatment, thus simulating the endocrine events which precede incubation in the female. Estrogen also stimulated the appearance of nest cooing (another isomorphic behavior) but not bow cooing (a male-specific display). Results are discussed in terms of hormonal specificity underlying reproductive behavior and the possible physiological roles of estrogen and progesterone in the ring dove. (25 ref)—*Journal abstract.*

530. Stille, G. & Hipplius, H. (Dr A. Wander Research Inst, Bern, Switzerland) **A critical assessment of the concept of "neuroleptics": (On the basis of pharmacological and clinical findings with clozapine).** *Foreign Psychiatry*, 1973-1974(Win), Vol 2(4), 50-66.—Describes the pattern of pharmacological activity of drugs therapeutically active against schizophrenia, designated neuroleptics: the cataleptic effect, inhibition of pharmacogenic stereotypes, and conditioned avoidance. The term "neuroleptic" was originally given by clinicians to certain patterns of clinical activity in which therapeutic action ("antipsychotic effect") and side effects (extrapyramidal motor effects) were taken into account. An antipsychotic effect has been demonstrated with clozapine, but without the pharmacological or extrapyramidal motor side effects. This makes it doubtful whether effects in the animal which are equivalent to the antipsychotic effect and corresponding side effects in man have been detected at all. Only with the classic neuroleptics do the cataleptic effect in animals and the extrapyramidal motor side effects in therapeutic use have value as indicator phenomena. Since the same drug may affect particular functions in totally different ways in humans and animals, concepts such as "neuroleptic" must not be identified too hastily with a clinical effect. (27 ref)—*Journal summary.*

531. Terkel, Joseph & Urbach, Leah. (Tel Aviv U, George S. Wise Ctr for Life Sciences, Israel) **A chronic intravenous cannulation technique adapted for behavioral studies.** *Hormones & Behavior*, 1974(Jun), Vol 5(2), 141-148.—Describes a technique by which multiple daily blood samples can be taken to form serial hormone profiles of individual Ss and which does not interfere with ongoing behavioral or physiological processes. Prolactin levels of female rats, which were determined as a measure of stress caused by the technique, were elevated only on the first postoperative day; subsequent levels were comparable to those of decapitated Ss.

532. Trafton, Clinton L. & Kahn, Marcia. (U Arizona) **Effects of cingulate cortex lesions and morphine premedication on morphine intake in rats.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 26-30.—Gave 35 albino rats either bilateral lesions in the cingulate cortex or sham operations. 16 Ss were subjected to a regimen of chronic morphine injections, and 19 received no premedication. Morphine-oriented behavior was indexed by a learned preference for a bitter morphine HCl solution. Bilateral anterior cingulate cortex lesions decreased the acquisition of drug-oriented behavior, while premedication enhanced morphine intake.—*Journal abstract.*

### Brain & Electrical Stimulation & Lesions

535. Alexander, Gay B., Broome, Belinda & Means, Larry W. (East Carolina U) **The effects of an irrelevant intertrial task on pattern discrimination in rats with hippocampal damage.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 459-461.—Compared rats with either hippocampal lesions or sham operations on Y-maze activity and visual pattern discrimination. Lesioned Ss were more active in the maze than controls and showed no evidence of a discrimination deficit with or without distraction (an irrelevant runway task on intertrial intervals). (15 ref)

536. Annau, Z.; Heffner, R. & Koob, G. F. (Johns Hopkins U, School of Hygiene and Public Health) **Electrical self-stimulation of single and multiple loci: Long term observations.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 281-290.—Allowed male hooded rats with chronic septal, anterior, and posterior hypothalamic electrodes continuous access to self-stimulation, food, and water in a 3-lever chamber. A prolonged burst of self-stimulation, with little food and water intake, was followed by bursts of activity on all 3 levers. A 12-hr light-dark cycle imposed a diurnal periodicity on all behaviors except in Ss self-stimulating at the highest daily rates where self-stimulation was equal in dark and light. Under constant light conditions there was a 30-min daily shift in the peak periodicity of all behaviors. Increasing the current by 10  $\mu$ A led to another continuous self-stimulation session for 1 day, with a subsequent decline and stabilization after 3 days. Reduction of the current to its original setting abolished self-stimulation for one day, but within 5 days rates returned to control values. The diurnal periodicity of self-stimulation seemed to be determined by the current intensity.—*Journal abstract.*

537. Bartlett, John R. & Doty, Robert W. (U Rochester, Ctr for Brain Research) **Influence of mesencephalic stimulation on unit activity in striate cortex of squirrel monkeys.** *Journal of Neurophysiology*, 1974(Jul), Vol 37(4), 642-652.—Placed stimulating electrodes at 1 mesencephalic locus in each of 14 squirrel monkeys, primarily in superior colliculus or mesencephalic reticular formation. In all instances stimulation (6 pulses, 200

Hz) at time of implantation altered synaptic transmission through the lateral geniculate nucleus when it preceded stimulation of the optic tract by 50-100 msec. In about  $\frac{1}{2}$  the 124 striate-cortex units tested, the stimulation altered background activity, response to visual input, or itself produced a brief discharge. With the significant exception that altered response to stimulation of optic radiation was infrequent, the mesencephalic influence was manifested on all types of units and/or responses previously described by the authors for striate cortex of the squirrel monkey (see PA, Vol 53:Issue 1). It is concluded that apparent absence of mesencephalic control in many units of the alert animal merely reflects existing maximal operation of the system. (15 ref) —*Journal summary.*

538. Bartlett, John R. & Doty, Robert W. (U Rochester, Ctr for Brain Research) **Response of units in striate cortex of squirrel monkeys to visual and electrical stimuli.** *Journal of Neurophysiology*, 1974(Jul), Vol 37(4), 621-641.—Studied activity of 239 units in the striate cortex of 28 unanesthetized immobilized squirrel monkeys. About 40% of the units tested with diffuse, steady light were luxotonic (i.e., their rate of discharge maintained for less than 1 min, in light vs dark, differed by a factor of at least 2 and/or varied monotonically with log luminance over at least a 3 log<sub>10</sub> range). In 44% of these units, no definitive receptive field was evident, whereas the others had small fields and responded to geometrical features of the stimulus. Rate of light or dark adaptation, threshold for the luxotonic effect, and its continuation beyond the level of rod saturation suggest that cones contribute the major input to luxotonic units. Additional data show that (a)  $\frac{1}{2}$  of the units responded to moving stimuli, (b) 50% responded to stroboscopic flashes, and (c) of 16 units tested for ocular dominance, 60% were binocular. It is concluded that many single units in the striate cortex are at least capable of conveying more than a single class of information. (45 ref) —*Journal summary.*

539. Bernston, Gary G. & Hughes, Howard C. (Ohio State U) **Medullary mechanisms for eating and grooming behaviors in the cat.** *Experimental Neurology*, 1974(Aug), Vol 44(2), 255-265.—Electrical stimulation of localized regions of the medullary reticular formation induced well-coordinated eating and grooming behaviors in 6 male and 13 female cats. Findings suggest that these behaviors resulted from the activation of specific sensorimotor mechanisms, rather than from the induction of generalized drive states. Eating and grooming, however, were directed and goal dependent and not merely motor automatisms. Other elicited responses included escape behavior and fragmentary components of threat behavior. Results contribute to the growing view that the lower brain stem may play an important role in the elaboration and control of complex species-characteristic behaviors. (37 ref) —*Journal abstract.*

540. Bloss, J. L. & Potts, W. J. (Searle Lab, Chicago, IL) **A simple swivel for intracranial electrical stimulation.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 343-344.—Describes an assembly which consists of a commercially available terminal tap, mercotac swivel, and receptacle. The swivel is inexpensive, requires no

machining, and cannot be disconnected by the animal during free movement.

541. Campbell, Byron A. & Baez, Luis A. (Princeton U) **Dissociation of arousal and regulatory behaviors following lesions of the lateral hypothalamus.** *Journal of Comparative & Physiological Psychology*, 1974(Jul), Vol 87(1), 142-149.—Investigated the effect of lesions of the lateral hypothalamus on feeding and spontaneous locomotor activity in 3 experiments with a total of 110 male Sprague-Dawley rats. Lateral hypothalamic lesions produced aphagia and adipsia but did not prevent the increase in locomotor activity characteristic of starvation. In addition, both food deprivation and lateral hypothalamic self-starvation potentiated amphetamine-induced behavioral arousal. However, the lesions did abolish incentive-motivated activity to a stimulus signaling food. Results suggest a dissociation between the neural mechanisms mediating arousal and regulatory behaviors. (32 ref)—*Journal abstract*.

542. Carlson, Neil R. & Vallante, Michael A. (U Massachusetts, Amherst) **Enhanced cue function of olfactory stimulation in mice with septal lesions.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 237-248.—Trained a total of 121 male hybrid normal mice and mice with septal lesions on a go-no-go discrimination task (multiple fixed interval of 15 sec, 15-sec extinction schedule) in 4 experiments. When the discrimination stimulus (the one which indicated to the S whether responding at the end of the interval would be reinforced) was a pellet of food (delivered at the start of the interval) or odor of food or non-nutritive substance (present throughout the 15-sec interval), acquisition of septum-damaged mice was enhanced. These lesions did not, however, alter performance when the discrimination was cued by a buzzer or flashing light. Results suggest that septal lesions produce an increased reactivity to olfactory stimuli and to stimuli associated with the delivery of food reinforcement. (24 ref)—*Journal abstract*.

543. Colby, John J.; Misovich, Stephen & Kasouf, Chickery. (Providence Coll) **Cue prominence as a determinant of VMH obesity.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1131-1136.—Manipulated food prominence in 23 female albino rats to test S. Schachter's (see PA, Vol 46:4450) notion that ventromedial hypothalamic (VMH) obesity is caused by lesion-induced hyperresponsivity to environmental stimuli. Results indicate, contrary to Schachter's proposal, that ad lib overeating by dynamic phase VMH-lesioned rats was not affected by the amount of food present. The findings are discussed in the context of Schachter's explanation and D. W. Thomas and J. Mayer's explanation for human and VMH obesity.—*Journal abstract*.

544. Conrad, B. & Brooks, V. B. (U Western Ontario, London, Canada) **Effects of dentate cooling on rapid alternating arm movements.** *Journal of Neurophysiology*, 1974(Jul), Vol 37(4), 792-804.—Studied the effects of brief reversible cooling of the dentate nucleus on ipsilateral rapid elbow movements in 3 male *Cebus* monkeys that turned a handle in the horizontal plane. It is concluded that in rapid, alternating arm movements, the dentate nucleus is involved in timing their durations and coordinating successive movements.

545. Cruce, Judith A.; Greenwood, M. R.; Johnson, P. R. & Quartermain, David. (U Wisconsin, Medical School, Madison) **Genetic versus hypothalamic obesity: Studies of intake and dietary manipulations in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 295-301.—Studied feeding behavior in 4 experiments with a total of 86 Zucker rats. Ad-lib food and water intakes were significantly greater for the genetically obese rats (fatties) than for their nonobese littermates. The ratio of water intake per gram of food intake was not different for the 2 groups. The ability to regulate caloric intake was then tested in 4 groups of rats: genetically obese, ventromedial hypothalamic lesioned (VMH) obese, sham operated, and normal controls. In response to caloric dilution and quinine adulteration the genetically obese Ss behaved more like normal Ss than like VMH-lesioned Ss. Sensitivity to quinine increased with age in the Zucker fatty. The fact that Ss with genetic obesity and Ss with hypothalamic obesity displayed different behaviors suggests that obesity is not merely a unitary disorder. (20 ref)—*Journal abstract*.

546. Daigneault, E. A. (Louisiana State U, Medical Ctr) **Source of the P<sub>1</sub> component of the cochlea round window recording.** *Acta Oto-Laryngologica*, 1974(Jun), Vol 77(6), 405-411.—Studied the response of cochlear round window potentials of cats and guinea pigs to a short click stimulus coupled with specifically placed neural lesions. The destruction of a specific area of the cochlear nucleus produced a loss of the positive portion of the potentials (P<sub>1</sub>) suggesting that the P<sub>1</sub> potential represents an activity of a peripheral coding or inhibitory mechanism. (German summary) (18 ref)

547. De Sisto, Michael J. & Zweig, Matthew. (Colby Coll) **Differentiation of hypothalamic feeding and killing.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 67-70.—Chronically implanted bipolar electrodes in the posterior lateral hypothalamic-medial forebrain bundle area of 30 hooded rats. Ss which displayed either stimulus-bound feeding or stimulus-bound killing were trained to self-stimulate and tested while given the opportunity to eat or kill during self-stimulation. Average duration of barpressing was greater in the presence of the goal object appropriate to the stimulus-bound behavior, suggesting a differentiation of hypothalamic mechanisms of feeding and killing. (33 ref)—*Journal abstract*.

548. Demski, L. S. & Gerald, J. W. (U New Mexico) **Sound production and other behavioral effects of midbrain stimulation in free-swimming toadfish, *Opsanus beta*.** *Brain, Behavior & Evolution*, 1974, Vol 9(1), 41-59.—Electrically stimulated the midbrain area of the acoustico-lateral lemniscus, ganglion isthmi, and medial torus semicircularis in free-swimming toadfish. Grunts (threat sounds) and boatwhistles (probable courtship calls) were evoked in both sexes during stimulation of this region, which has been termed the sonic midbrain area (SMA). Several locomotor and defensive responses were elicited with sound production; however, neither complete reproductive nor aggressive patterns were observed. Several points adjacent to the SMA were negative for sound production. It is postulated that the SMA integrates various sensory and hormonal stimuli

and controls sound production through connections to lower sonic motor mechanisms. (42 ref)—*Journal abstract.*

549. DeVietti, Terry L. & Hopfer, Thomas M. (Central Washington State Coll) **ECS-induced amnesia: Retention function consistent with state dependency predictions.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 35-37.—Administered a single fear-conditioning footshock to 144 hooded rats, and tested their retention in different subgroups at 24-hr intervals through 144 hrs after conditioning. Retention was strong and undifferentiated at all test intervals. However, rats given ECS .5 sec after the footshock, while evidencing amnesia at all tested intervals, showed less amnesia at 96 and 144 hrs after training and ECS. This pattern of amnesia was predicted by the state-dependency hypothesis. The implications of these data regarding the role of state dependency in determining the recovery of memory following amnesia induced by a posttraining trial ECS are discussed. 550. Edwards, David A. (Emory U) **Non-sensory involvement of the olfactory bulbs in the mediation of social behaviors.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 287-302.—Discusses the results of studies which demonstrate that bilateral removal of the olfactory bulbs produces a syndrome of profound and apparently permanent social behavioral deficits. These deficits are not seen when mice are rendered anosmic by a peripheral manipulation not affecting the integrity of the olfactory bulbs. It is suggested that the olfactory bulbs are importantly involved in a nonsensory manner in the control of social behaviors in the mouse. (32 ref)—*Journal abstract.*

551. Ellman, Steven J. et al. (City Coll, City U New York) **Relationship between dorsal brainstem sleep sites and intracranial self-stimulation.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 31-34.—Tested the hypothesis that some sites involved in triggering rapid eye movement (REM) sleep are also good sites for intracranial self-stimulation (ICSS). 5 brain locations in 37 albino rats—the locus coeruleus (LC), the medial longitudinal fasciculus (MLF), the dorsal longitudinal fasciculus (DLF), and the ventral raphe (pontine level)—were explored. Rate-intensity functions were obtained from Ss displaying ICSS. High rates of ICSS (15,000/hr) were obtained at several dorsal brain sites. These sites included the LC, pontine aspects of the MLF, and posterior midbrain aspects of the MLF and DLF. ICSS from the LC is interpreted as evidence that noradrenergic ICSS sites are part of the REM sleep neural network.—*Journal abstract.*

552. Evans, S. M. (U. Newcastle upon Tyne, England) **A study of fighting reactions in some nereid polychaetes.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 138-146.—Describes fighting behavior in 3 nereid polychaetes (*Nereis pelagica*, *N. diversicolor*, and *N. dumerilii*). Fighting occurs less often in intra- than interspecific encounters. Many intraspecific encounters end without fighting because the worms either separate immediately on contact or explore one another with their palps and then separate. Individual *N. pelagica* can discriminate between individuals of their own and foreign species because they react differently in intra-

and interspecific encounters. After removal of any one of the anterior sense organs (cirri, palps, or tentacles), they can still make this discrimination but cannot do so after removal of all 3 of these organs.—*Journal abstract.*

553. Fibiger, Hans C. & Grewaal, Darshan S. (U. British Columbia, Div. of Neurological Sciences, Vancouver, Canada) **Neurochemical evidence for denervation supersensitivity: The effect of unilateral substantia nigra lesions on apomorphine-induced increases in neostriatal acetylcholine levels.** *Life Sciences*, 1974(Jul), Vol. 15(1), 57-63.—Unilateral lesions in male Wistar rats induced by injections of 6-hydroxydopamine into the zona compacta of the substantia nigra resulted in reduction of neostriatal dopamine to less than 6% of the control side. 2 mo later intraperitoneal injections of apomorphine (1 mg/kg) produced contralateral turning and a significant increase in neostriatal acetylcholine levels. Haloperidol (1 mg/kg) produced a significant decrease in neostriatal acetylcholine, but this decrease did not differ between the "denervated" and intact neostriata. The lesions did not by themselves affect neostriatal acetylcholine levels. The fact that apomorphine produces a greater increase in neostriatal acetylcholine after lesions of the dopaminergic nigro-neostriatal projection supports earlier behavioral data suggestive of denervation supersensitivity of neostriatal dopaminergic receptors after these lesions. (25 ref)—*Journal abstract.*

554. File, Sandra E. (City of London Polytechnic, England) **Sodium pentobarbital and habituation—acquisition and transfer between states.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 18-22.—Tested 120 hooded rats on habituation of licking response to successively presented tones. Subanesthetic doses of sodium pentobarbital impaired, but did not prevent, the acquisition of the behavioral habituation. Ss habituated in a saline state showed transfer of habituation when later tested in a drugged condition. Ss habituated while drugged and then tested under saline conditions showed much less transfer of habituation, and more Ss showed state-dependent habituation as the drug dose during acquisition of habituation was increased. (33 ref)—*Journal abstract.*

555. Gaito, John. (York U, Downsview, Ontario, Canada) **The kindling effect.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 45-50.—Reviews literature on the kindling effect, a phenomenon whereby animals subjected periodically to low-intensity electrical stimulation unilaterally to the amygdala or some other brain sites gradually develop automatic behaviors which culminate eventually in convulsions. Characteristic brain wave patterns accompany these behavioral changes. A 60-Hz sine wave with a 24-hr interval provides the optimum stimulation. This kindling effect shows some characteristics similar to learning events (i.e., relatively permanent changes, positive and negative transfer effects, and involvement of limbic system). Results suggest that 2 factors are involved in the kindling process: a long-term effect of positive nature (probably due to modified neural circuitry) and a short-term aftereffect of negative nature. (37 ref)—*Journal abstract.*

556. Gittis, Alan & Hothersall, David. (Ohio State U, Lab of Comparative & Physiological Psychology) **DRL performance of juvenile rats with septal lesions.**

*Physiological Psychology*, 1974(Mar), Vol 2(1), 38-42.

—Gave lesions of the septal nuclei to 19 infant hooded rats, and control operations to 12 others. After weaning at 21 days, Ss were trained to leverpress for food. A differential enforcement of low rates (DRL) 20-sec schedule was then used, Ss being tested either in a conventional operant chamber or in one which contained wooden balsa blocks. DRL training continued for 40 daily 60-min sessions. The Ss successfully leverpressed for food. The presence of the wooden blocks facilitated the development of efficient DRL behavior in the lesioned Ss but not in the controls. With training, Ss with septal lesions trained in conventional chambers showed an improvement in their DRL behavior. (26 ref)  
—*Journal abstract.*

557. Glick, S. D. & Marsanico, R. G. (Mount Sinai School of Medicine, City U New York) **Schedule-dependent recovery of barpressing performance in frontal rats.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 65-66.—8 rats with bilateral frontal cortical ablations showed early postoperative rate decrements on either a fixed interval (FI) 15 or fixed ratio (FR) 30 schedule of barpressing for water. Although the performance of all frontal Ss recovered to some extent during 1 mo of postoperative testing, complete recovery occurred only in Ss tested on the FI 15 schedule. Observations of barpressing behavior indicated that FR 30 barpressing required a degree of bimanual motor coordination not required in normal FI 15 barpressing. A persistent disruption of such coordination by frontal cortical lesions appeared to account for the differential recovery of barpressing rates on the 2 schedules.—*Journal abstract.*

558. Goodman, Edward D. & Russell, I. Steele. (Emory U) **Split brain rat: A new surgical approach.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 327-330.—Sectioned the corpus callosum in the midline by insertion of a 24-gauge needle and retractable knife horizontally through the dorsal cerebellum of 5 male albino rats. The callosum was sectioned through most of its extent, and incidental damage to the midline cerebral cortex was either minimal or absent. Gross postoperative motor deficits or other behavioral changes were absent.

559. Hamilton, Charles R.; Tieman, Suzannah B. & Farrell, William S. (California Inst of Technology, Div of Biology, Pasadena) **Cerebral dominance in monkeys?** *Neuropsychologia*, 1974(Mar), Vol 12(2), 193-197.—Trained visual discrimination of several types of stimuli to each hemisphere of 7 split-brain monkeys. Stimuli that differed only in orientation and that were spatially redundant were learned in fewer trials by the left hemisphere than by the right. Other stimuli (e.g., bilaterally symmetrical patterns, up-down mirror images, or photographs of monkeys' faces) were learned, on the average, equally easily by either hemisphere. These preliminary results suggest that monkeys may exhibit some degree of cerebral dominance. (French & German summaries) (19 ref)—*Journal abstract.*

560. Igarashi, M.; Alford, B. R.; Gordon, Wm. P. & Nakai, Y. (Baylor Coll of Medicine, Houston, TX) **Behavioral auditory function after transection of crossed olivo-cochlear bundle in the cat: II. Conditioned visual performance with intense white noise.** *Acta Oto-*

*Laryngologica*, 1974(May), Vol 77(5), 311-317.—Trained 6 healthy adult cats to respond to a visual signal in the presence of distracting background white noise. The fixed performance-ratio was measured by varying the intensity of the background white noise. Following surgical elimination of the crossed olivo-cochlear bundle, Ss exhibited an increase in white noise distraction in the light signal detection task. Statistical analysis confirmed a significant difference between the experimental and sham-operated groups. Electron microscopic and neuro-histological investigations confirmed the disappearance of the efferent nerve endings in the cochlea and that proper midline olivo-cochlear bundle sections had been made. It is suggested that one way in which the crossed olivo-cochlear bundle operates to inhibit acoustic processing is by activation from a sensory system of a different modality. (German summary)—*Journal abstract.*

561. Kemble, Ernest D. & Nagel, Jennifer A. (U. Minnesota, Div. of Social Sciences, Morris) **Effects of amygdaloid lesions in rats on food and water intake and body weight under varied ambient temperatures.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 31-32.—Measured food and water intake and body weight in 7 amygdala-lesioned and 7 control male Holtzman albino rats under 3 (70, 60, and 80°F) ambient temperature conditions. Both experimental and control Ss responded similarly to these manipulations with no suggestion of lesion-induced deficiency. Data are consistent with other research, which suggests that damage to basolateral portions of the amygdala leaves daily food and water regulatory mechanisms intact.—*Journal abstract.*

562. Kenney, Nancy J. & Mook, Douglas. (U Virginia) **Effects of ovariectomy on meal pattern in the albino rat.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 302-309.—In a study with 24 female albino Sherman rats, it was found that after ovariectomy most Ss increased food intake while continuing to eat discrete meals. Meal size increased in ovariectomized Ss, whereas meal frequency decreased. It is suggested that ovariectomy impairs the onset of satiety during a meal but not the ability to regulate total intake through modification of intermeal interval. (21 ref)  
—*Journal abstract.*

563. King, John O. (Coll of St Teresa) **Effects of frontal ablations on auditory discrimination in the rat.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 75-79.—Used a free operant discrimination procedure to study the effects of frontal ablations in 2 groups of 3 Sprague-Dawley rats. Both groups were trained on a multiple fixed-ratio 3 extinction schedule, and then the experimental group received frontal lesions. Following recovery they were returned to the multiple schedule. It was found that for the experimental group there was a significant loss in discrimination following frontal lesions. These results support those of a study by L. Weiskrantz and M. Mishkin (1958).—*Journal abstract.*

564. Kinson, Gordon A. & Liu, Chung-Ching. (U Ottawa, Medical Faculty, Ontario, Canada) **Long-term testicular responses to blinding in rats.** *Life Sciences*, 1974(Jun), Vol 14(11), 2179-2188.—Blinding at 1-mo of age was without effect upon gametogenic function of the

testis of Sprague-Dawley rats. Testicular venous levels of testosterone in intact Ss showed a postpubertal spurt followed by a seasonal peak, and the latter was paralleled by a similar peak in peripheral testosterone. Blinding led to suppression of the postpubertal surge, but testicular vein levels of testosterone were not significantly altered from control values. Testosterone concentrations in peripheral plasma of blinded Ss were consistently lower than in controls until 12 mo postsurgery. Results illustrate a somewhat small degree of gonadal dependency upon photic input in the male rat, particularly when compared with responses reported for the hamster subjected to similar experimental conditions.—*Journal abstract*.

565. Liu, C. M. & Yin, T. H. (National Defense Medical Ctr, Kohlberg Lab, Taipei, Republic of China) **Caloric compensation to gastric loads in rats with hypothalamic hyperphagia.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 231-238.—Hyperphagic male Sprague-Dawley albino rats responded to daily loads of either glucose or oil by reducing food intake without affecting weight gain. Loads of either substance did not enhance fat deposit compared to control loads of water or liquid paraffin. There was no relaxation of caloric compensation even during the acute increase of food intake shortly following the placement of lesions in the ventromedial hypothalamus. (24 ref)

566. MacNeil, Donald A. (Hoffman-LaRoche Inc, Research Div, Nutley, NJ) **Lateral hypothalamic self-stimulation: Effect of excess body weight.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 51-52.—Measured self-stimulation in the lateral hypothalamus of 5 female albino rats which had been made obese by force-feeding. The mean self-stimulation rate was significantly less at the obese weight than at normal weight levels. Results are consistent with the view that a factor correlated with obesity inhibits feeding by inhibiting lateral hypothalamic reward.

567. Manning, Frederick J. & McDonough, John H. (Walter Reed Army Inst of Research, Washington, DC) **Reinforcement omission, non-contingent reinforcement, and limbic lesions in rats.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 327-338.—Gave 2 groups of 6 male Wistar-derived albino rats lesions of the septum and dorsal hippocampus, respectively. Under a fixed-interval (FI) 1-min schedule of food reinforcement, septal Ss leverpressed at significantly higher response rates than 12 intact controls. Under a modified FI 1-min schedule during which food pellets were occasionally omitted, every S made more responses in intervals following omissions than in those following pellet deliveries, but Ss with hippocampal lesions showed a larger increase in response rate than either controls or septals, which did not differ. In Exp II, half of the Ss were subjected to experimental extinction and half provided with noncontingent reinforcement at 1-min intervals. Both procedures decreased responding, but only under extinction did the experimental groups show slower decreases than the controls. Although these data provide a clear double dissociation for septal and dorsal hippocampal lesions, they present substantial difficulties for both disinhibition and perseveration theories of septal and hippocampal function. (32 ref)—*Journal abstract*.

568. McLeese, D. W. (Dept of Environment, Biological Station, St Andrews, New Brunswick, Canada) **Olfactory responses of lobsters (*Homarus americanus*) to solutions from prey species and to seawater extracts and chemical fractions of fish muscle and effects of antennule ablation.** *Marine Behaviour & Physiology*, 1974, Vol 2(3), 237-249.—Tank water from intact prey and extract of Echinoderms were practically nonstimulatory to lobsters, whereas extracts of molluscs, crustaceans, and fish were highly stimulatory. Observations of the olfactory response of lobsters with the medial, lateral and medial, and lateral branches of the antennule bilaterally ablated indicate that the lateral branch performs a chemoreceptive function and that the medial branch assists in chemoreception, perhaps through orientation to water current.

569. Murphy, Lawrence R. & Brown, Thomas S. (DePaul U) **Hippocampal lesions and learned taste aversion.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 60-64.—Compared 16 rats with hippocampal lesions with 16 neocortical and 16 sham-operated controls on a taste-aversion learning task, using an 8% sucrose solution as the conditioned stimulus (CS) and 2% body weight intraperitoneal injection of .15 M lithium chloride as the unconditioned stimulus (UCS). Hippocampally ablated Ss acquired the taste aversion as rapidly as controls after a single CS-UCS pairing. No differences were found among the groups in terms of either the magnitude or extinction of the aversion. Results do not support the interpretation of hippocampal function as a general loss of response inhibition; rather they confirm and extend previous findings indicating that the enhanced perseverative tendencies frequently noted in rats with hippocampal lesions are absent in consummatory-type tasks. (32 ref)—*Journal abstract*.

570. Neill, Darryl B.; Ross, Joseph F. & Grossman, Sebastian P. (Emory U) **Comparison of the effects of frontal, striatal, and septal lesions in paradigms thought to measure incentive motivation or behavioral inhibition.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 297-305.—Conducted 3 experiments with 65 male Holtzman and Sprague-Dawley albino rats; 21 other Ss served as controls. Bilateral electrolytic lesions of the ventral, but not dorsal, anterior striatum produced overresponding in Ss performing on a modified delayed reinforcement of low rates 30-sec schedule of reinforcement. An analysis of the types of errors indicated important differences between the effects of septal and striatal lesions. Comparisons of Ss with frontal, striatal, and septal lesions with respect to their acquisition of saccharine licking, latency to eat in a novel environment, and acquisition of a runway response indicated that only septal lesions reliably enhanced approach tendencies. Data suggest that the behavioral changes seen after striatal or frontal damage in the rat are not due to enhanced responsivity to rewarding stimuli. (40 ref)—*Journal abstract*.

571. Nonneman, Arthur J.; Voigt, James & Kolb, Bryan E. (Pennsylvania State U, Animal Behavior Lab) **Comparisons of behavioral effects of hippocampal and prefrontal cortex lesions in the rat.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 249-260.—5 groups of 5 male Wistar rats each, with

aspiration lesions of dorsomedial frontal cortex, ventrolateral frontal cortex, hippocampus, or posterior cortex, or with sham operations, were tested in 5 behavioral situations: emotionality assessment, serial spatial reversals, 70:30 spatial probability, differential reinforcement of low rates (DRL), and barpress extinction. Ss with posterocortical lesions did not differ from operated controls on any task. The effects of lesions in the 2 anatomically defined frontal subfields were clearly dissociated on spatial reversals, spatial probability, and DRL. Lesions in either subfield produced a significant increase in emotionality relative to controls, and neither lesion affected barpress extinction. Results suggest that both frontal subfields may be functionally related to the hippocampus but in different ways. (31 ref)—*Journal abstract*.

572. Numan, Robert & Lubar, Joel F. (New England Regional Primate Research Ctr, Southborough, MA) **Role of the preoral gyrus and septal area in response modulation in the cat.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 219-234.—In a study with 25 cats, damage to the medial and dorsal septal nuclear groups or to the ventral sector of gyrus preus impaired performance during acquisition of a differential reinforcement of low rates 40 schedule. The deficit was diminished during the presentation of a feedback stimulus signaling the termination of the required delay, but reappeared when feedback was withdrawn. In the absence of feedback, deficient Ss generated response distributions correlated with each other, but not correlated with distributions generated by controls. During feedback, all group distributions were correlated. Collateral behavior was evident in all Ss during nonfeedback periods, and was reduced during feedback. Results support the view that damage to the septum, or frontal cortex impairs the effective utilization of response-produced proprioceptive stimuli. (French & German summaries) (37 ref)—*Journal abstract*.

573. Oakley, David A. & Russell, I. Steele. (University Coll London, England) **Differential and reversal conditioning in partially neocorticate rabbits.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 221-230.—5 normal male New Zealand albino rabbits and 8 others with extensive unilateral or bilateral neocortical lesions were required to differentiate between visual and auditory stimuli in a Pavlovian situation and then to reverse that differentiation. Neocortical ablations had no effect on the initial differentiation, and the lesioned Ss were superior to normals in their performance on the reversal task. The lesioned Ss in particular did not show the same tendency as normals to continue responding to the negative stimulus under reversal conditions. Possible sources of the apparently greater efficiency shown by the neocorticates are discussed. (15 ref)—*Journal abstract*.

574. Olton, David S. & Gage, Fred H. (Johns Hopkins U) **Role of the fornix in the septal syndrome.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 269-279.—Tested female Sprague-Dawley rats for their reactivity to a puff of air, loud noise, and touch on the back following fornix and septal lesions. Septal lesions produced the expected hyperreactivity. Large fornix lesions 9 days prior to the septal lesion, or fornix lesions within 10 min of the septal lesions, blocked the hyperreactivity expected from the septal lesions. Partial

fornix lesions partially suppressed the hyperreactivity. Data indicate that intact septohippocampal connections are necessary for the appearance of hyperreactivity following a septal lesion. (30 ref)—*Journal abstract*.

575. Oscar-Berman, Marlene; Heywood, Simon & Gross, Charles G. (VA Hosp, Boston, MA) **The effects of posterior cortical lesions on eye orientation during visual discrimination by monkeys.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 175-182.—Took motion pictures of the eyes of 12 immature male rhesus monkeys as they learned 2-choice visual discriminations. Preoperative gaze patterns were compared to gaze patterns following ablation of visual areas in the temporal and occipital lobes. After inferotemporal and prestriate lesions, Ss showed (a) increased postoperative staring at the discriminanda on the preferred side; (b) decreased rate of gaze shift from 1 stimulus to another; and (c) as expected, slower learning. (French & German summaries)—*Journal abstract*.

576. Parnas, I.; Armstrong, D. & Strumwasser, F. (California Inst of Technology, Div of Biology) **Prolonged excitatory and inhibitory synaptic modulation of a bursting pacemaker neuron.** *Journal of Neurophysiology*, 1974(Jul), Vol 37(4), 594-608.—Describes long-lasting synaptically induced modulation of the spontaneous activity of the parabolic burster in the parietovisceral ganglion of sponges *Aplysia californica*. This neuron (R15) was innervated by at least 3 axons from the right pleurovisceral connective. One was excitatory while the other 2 evoked biphasic postsynaptic potentials (BPSPs) with a predominantly hyperpolarizing phase. Activation of the excitatory, dextrotubocurarine-sensitive input for only 3 min led to a dramatic increase in the number and frequency of spikes in each burst. Hyperpolarizing the cell to block all spiking for several minutes reversed the effect to the prestimulation level. Synaptic activation was necessary to produce this effect. Stimulating 1 of the BPSPs for 3-10 pulses completely blocked bursting for nearly 1 hr. Findings demonstrate 2 synapses—1 excitatory and 1 inhibitory—which suggest that these inputs may be involved in the entrainment of R15's circadian rhythm of impulse activity. (30 ref)—*Journal summary*.

577. Phillips, Richard E. & Youngren, Orlan M. (U Minnesota) **A brain pathway for thalamically evoked calls in birds.** *Brain, Behavior & Evolution*, 1974, Vol 9(1), 1-6.—Investigated the relationships between 2 brain stem regions where electrical stimulation (ESB) evokes repetitive vocalizations in birds, using anesthetized female F1 strain inbred chickens as Ss. Electrodes were placed in the midbrain call region (MCR) and in a region ventral to nucleus ovoidalis (OM) and checked for ESB-evoked calling. Radio-frequency lesions were then made in MCR, and the OM site was retested for evoked vocalizations. Lesions in MCR abolished calls evoked from OM, indicating that OM excitation produces calls via ipsilateral MCR.—*Journal abstract*.

578. Rutledge, L. T.; Wright, C. & Duncan, J. (U Michigan, Medical School) **Morphological changes in pyramidal cells of mammalian neocortex associated with increased use.** *Experimental Neurology*, 1974(Aug), Vol 44(2), 209-228.—After long-term electrical stimulation of the brain in 4 adult cats, which presumably

produced increased neuronal use, histological studies were made of neocortical neurons involved in transcallosal and extracallosal systems. The observed changes in neuronal structure described in these experiments are interpreted as evidence that increased use of specific pathways to the cerebral cortex produces postsynaptic growth in some cortical neurons. (43 ref)

579. Saporta, Samuel & Greene, Ernest. (U California, Medical School, Ctr for the Health Sciences, Los Angeles) **Orienting bias in the rat produced by hippocampal lesion.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 339-351.—Investigated the view of hippocampal function which proposes that it acts as an attentional gating device, a theory which relies heavily on the inability of hippocampally lesioned animals to orient normally. Results of Exp I with 16 male Long-Evans hooded rats are consistent with the attentional theory: unilateral lesions of the hippocampus produced ipsilateral orienting to symmetrically presented stimuli. However, Exp II with 16 additional Ss showed that the direction of orienting bias to a visual stimulus was not altered by cutting the optic chiasm, a procedure which functionally reversed visual influence to lesioned and intact hemispheres. Since the direction of bias produced by unilateral hippocampal lesion was unchanged by this reversal of sensory input, it seems likely that the orienting bias is due to a motor rather than a sensory impairment. (26 ref)—*Journal abstract*.

580. Sharpe, Lawrence G.; Garnett, Janie E. & Cicero, Theodore J. (Washington U, Medical School) **Analgesia and hyperreactivity produced by intracranial microinjections of morphine into the periaqueductal gray matter of the rat.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 303-313.—Made a total of 137 microinjections of morphine sulfate in doses of 1.0-50  $\mu$ g into various midbrain sites of 47 implanted male Sprague-Dawley rats. 3-6  $\mu$ g of morphine injected in a .5  $\mu$ l volume produced a marked increase in hot-plate reaction time when injected into the periaqueductal gray matter ventral to the cerebral aqueduct encompassing the dorsal raphe nucleus and bordering tissue. Low doses of morphine in other midbrain loci produced less effective antinociceptive activity or no analgesia at all. 10-50  $\mu$ g of morphine eliminated the pain response to limb pinching, but in addition caused Ss to become hyperreactive. Death resulted in 7 Ss. Although mild hyperactivity (i.e., spontaneous motor activation) was frequently observed when 3  $\mu$ g of morphine was microinjected into more lateral midbrain sites, this dose elicited little or no hyperreactivity. Results (a) agree with studies that show identical sites of action for electrical analgesia in the rat, and (b) suggest that morphine and electrical stimulation have similar mechanisms of action in producing analgesia when these active midbrain sites are involved. (34 ref)—*Journal abstract*.

581. Shin, Seon H.; Howitt, Chris & Milligan, John V. (Queen's U, Kingston, Ontario, Canada) **A paradoxical castration effect on LH-RH levels in male rat hypothalamus and serum.** *Life Sciences*, 1974(Jun), Vol 14(12), 2491-2496.—Serum and hypothalamic luteinizing hormone releasing hormone (LH-RH) was lowered in male Sprague-Dawley rats after castration. Testosterone injections raised the hypothalamic LH-RH content signifi-

cantly. The mean value of serum LH level was elevated by testosterone, but not significantly. Hypothalamic LH-RH content was lowered by hypophysectomy and subsequently increased by testosterone injections.

582. Shinoda, Y. & Yoshida, K. (U Tokyo, Faculty of Medicine, Inst of Brain Research, Japan) **Dynamic characteristics of responses to horizontal head angular acceleration in vestibuloocular pathway in the cat.** *Journal of Neurophysiology*, 1974(Jul), Vol 37(4), 653-673.—Determined the dynamic characteristics of responses to sinusoidal oscillation of the head in several structures along the pathway of the horizontal canal system in the vestibuloocular reflex arc. Data from 64 cats reveal the transfer functions of each component structure within the entire vestibuloocular system and suggest the existence of a neural integrator situated postsynaptically to the vestibular nuclei neurons and presynaptically to the ocular motoneurons. (38 ref)

583. Siegel, Philip & Wepsic, James G. (Massachusetts General Hosp Neurosurgical Service, Boston) **Alteration of nociception by stimulation of cerebellar structures in the monkey.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 189-194.—Stimulated 15 cerebellar targets in each of 7 male squirrel monkeys to evaluate the effect of cerebellar stimulation upon painful tail shocks. An elevation of nociceptive thresholds occurred when cerebellar areas whose efferents traverse the brachium conjunctivum were stimulated. Stimulation of cerebellar areas related to the brachium restiformis produced no change. (22 ref)—*Journal abstract*.

584. Teitelbaum, Herman; Catrivas, George N. & McFarland, Willard L. (US Defense Nuclear Agency, Armed Forces Radiobiology Research Inst, Bethesda, MD) **Reversal of morphine tolerance after medial thalamic lesions in the rat.** *Science*, 1974(Aug), Vol 185(4149), 449-451.—Compared the bioelectrical responses of the caudate nucleus, medial thalamus, and cortex of 10 male albino rats to morphine. Tolerance, manifested by a diminished EEG response at cortical and subcortical recording sites, was found in Ss subjected to repeated systemic injections of morphine sulfate. Reversal of tolerance to morphine resulted from destruction of the medial thalamus, although these lesions had little, if any, effect on the withdrawal effects of naloxone.—*Journal abstract*.

585. Thompson, Robert. (Louisiana State U, Baton Rouge) **Localization of the "maze memory system" in the white rat.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 1-17.—Trained 86 albino rats on a 3-cul maze and subsequently performed bilateral cortical or subcortical lesions, and tested the Ss for retention. Defective retention resulted from damage to the anterior neocortex, posterior neocortex, cingulate cortex, corpus striatum, hippocampus, septofornix area, thalamus, posterolateral hypothalamus, mamillary bodies, subthalamus, red nucleus, substantia nigra, central tegmentum, ventral portions of the brain-stem reticular formation, or the cerebellum. Excellent retention was recorded after damage to the amygdaloid complex, rostral medial forebrain bundle, dorsomedial thalamus, or dorsal midbrain. These results, coupled with earlier findings, suggest that the maze habit is dependent upon the activities of 3 functional blocks of the brain: the 1st

block (brain-stem reticular formation) has integrative functions, the 2nd block (sensorimotor cortex, cingulate cortex, cerebellum, and thalamus) has kinesthetic functions, and the 3rd block (occipital cortex, hippocampus, septofornix area, and mamillary bodies) plays a role in the discrimination of spatial cues. (70 ref)—*Journal abstract*.

586. Uemura, Takuya & Cohen, Bernard. (Tokyo Women's Medical Coll, Japan) **Effects of vestibular nuclei lesions on vestibulo-ocular reflexes and posture in monkeys.** *Acta Oto-Laryngologica*, 1973, Suppl 315, 71 p.—Presents details of experiments with 30 juvenile rhesus monkeys with discrete lesions of the lateral, descending, superior, and medial vestibular nuclei. Effects of subsequent labyrinthectomies and postural and oculomotor changes (e.g., head tilt, falling tendencies, nystagmus, and canal paresis) are described and integrated with recent anatomical and physiological studies. (3/4 p ref)

587. Yaginuma, Shigeya & Iwahara, Shinkuro. (Tokyo U of Education, Japan) **Retrograde effects of electroconvulsive shock upon conditioned emotional responses in rats.** *Annual of Animal Psychology*, 1972(Nov), Vol 22(1), 1-8.—Studied the retrograde effects of electroconvulsive shock (ECS) on conditioned immobilization and defecation. 65 male rats of the Wistar-Imamichi strain received foot shock (FS) for 5 sec after being in a test box for 25 sec. The retention of the conditioned emotional responses was tested 24 hr later. The Ss that received ECS within 30 sec of FS froze as frequently, and defecated as many boluses, as the control Ss that did not receive ECS. Results suggest that the retrograde effect of ECS on the retention of passive avoidance cannot be attributed to either the disruption of memory trace or the suppression of conditioned immobilization by ECS.—S. Nakajima.

#### Drug Effects

588. Albin, Maurice S.; Bunegin, Leonid; Massopust, Leo C. & Jannetta, Peter J. (U Pittsburgh, Medical School) **Ketamine-induced postanesthetic delirium attenuated by tetrahydroaminoacridine.** *Experimental Neurology*, 1974(Jul), Vol 44(1), 126-129.—Results of observations made on 20 dogs given ketamine hydrochloride (KH), tetrahydroaminoacridine (THA) or combinations of both show that Ss administered THA 2 min after KH showed a marked and significant decrease in duration of KH anesthesia compared to the KH controls. The THA-KA interaction also significantly decreased abnormal autonomic, central, and motor responses from KH control levels. (16 ref)

589. Angel, Charles; Murphree, Oddis D. & DeLuca, Donald C. (VA Hosp, Neuropsychiatric Research, North Little Rock, AR) **The effects of chlordiazepoxide, amphetamine and cocaine on bar-press behavior in normal and genetically nervous dogs.** *Diseases of the Nervous System*, 1974(May), Vol 35(5), 220-223.—Studied 4 stable (A-strain) and 4 "genetically nervous" (E-strain) benzodiazepine dogs. It was found that administration of a benzodiazepine (chlordiazepoxide) facilitated acquisition of goal-directed behavior in genetically nervous Ss. Continued administration of the drug was required to maintain barpress response in this E strain.

The concomitant administration of either cocaine or amphetamine, compounds which inhibit neuronal reuptake of norepinephrine, disrupted the behavioral response of the genetically nervous E-strain Ss to a far greater extent than the stable A-strain Ss. After 14 days of daily administration of chlordiazepoxide, withdrawal of the drug not only resulted in almost complete loss of barpress response in the E-strain Ss but also resulted in a temporary decrease in the acquired behavioral response of the stable A-strain Ss.—*Journal summary*.

590. Bader, A. [Effect of hallucinogenic drugs on artistic creativity.] (Germ) *Confinia Psychiatrica*, 1973, Vol 16(3-4), 159-176.—Reports a discussion between 2 painters, a sociologist with a particular interest in art, a doctor who owns an art gallery, and 4 psychiatrists, during a working session of the German-Language Society of Psychopathology of Expression, at Freudstadt, Germany, in 1972. It was recognized that a hallucinogenic drug cannot itself have any creative value, but may, under certain conditions, induce a modification in style or at least stimulate the presentation of new raw material. The concept of "creativity" was examined, drawing a distinction between the ordinary creativity of the general run of people and the specialized creativity of the artist. The latter entails a formal elaboration which permits communication to others—a function which is in fact disturbed by the drug. It is noted that both qualitative and quantitative factors come into play. The substrate upon which the drug acts must not only be fertile but must be prepared for the experiment. Its sensitivity must be tested and dosages determined accordingly. Both personal conditions (the set), and environmental conditions (the setting) are of fundamental importance. In the absence of adequate preparation, the artist is in danger of using up all his energy in combating the intrusion into his familiar imaginary world of new phenomena produced by the drug. By taking certain technical precautions, physicians can help the artist to derive benefit from this new material.—*Journal abstract*.

591. Blum, K. & Wallace, J. E. (U Texas, Health Science Ctr, San Antonio) **Effects of catecholamine synthesis inhibition on ethanol-induced withdrawal symptoms in mice.** *British Journal of Pharmacology*, 1974(May), Vol 51(1), 109-111.—Studied the effects of  $\alpha$ -methyl-para-tyrosine on ethanol-induced withdrawal symptoms in mice. Significant potentiation of the withdrawal convulsion score induced by ethanol vapor exposure for 3 days was observed. Results indicate that reductions in catecholamines (dopamine and norepinephrine) augment seizure activity induced by subchronic exposure to ethanol.

592. Bradley, P. B. & Dray, A. (U Birmingham, Medical School, England) **The effects of microiontophoretically applied morphine and transmitter substances in rats during chronic treatment and after withdrawal from morphine.** *British Journal of Pharmacology*, 1974(May), Vol 51(1), 104-106.—Studied the effects of microiontophoretically applied acetylcholine (ACh), noradrenaline (NA), 5-hydroxytryptamine (5-HT), and morphine on single brain stem neurons of rats chronically pretreated with morphine and 24 hrs after morphine withdrawal. No significant changes were observed in the

initial spontaneous firing rate or in the qualitative or quantitative effects of ACh, NA, or 5-HT. There was a significant decrease in the number of neurons excited by morphine or showing tachyphylaxis to morphine on repeated applications.

593. **Brophy, Patrick D. & Levitt, Robert A.** (Rose-Hulman Inst of Technology, Div of Humanities & Social Sciences, Terre Haute, IN) **Effects of transmitter mimickers at sites of angiotensin-induced drinking in the cat.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 432-434.—Tested a variety of mimickers of synaptic transmitter activation (e.g., norepinephrine and carbachol) at neural sites in the cat effective for the elicitation of drinking by angiotensin-II. None of the mimickers produced a significant drinking response, although other behavioral effects were noted for carbachol and the catecholamines. (22 ref)

594. **Brown, Clinton C.; McAllister, Diane R. & Turek, Ibrahim.** **Psychomotor test performance with a fenfluramine-amphetamine combination.** *Journal of Clinical Pharmacology*, 1974(Jul), Vol 14(7), 369-376.—Studied the effects of fenfluramine, amphetamine, and a combination of the 2 on the speed and accuracy of psychophysical tests. 24 Ss served in a double-blind factorially designed experiment. 10 psychomotor tests were administered over a 5-day period. Findings were significant on 6 of the 10 tests, usually between amphetamine and placebo. Fenfluramine alone did not differ from placebo. The combination of the 2 drugs produced performances similar to that of amphetamine alone.—*P. Federman*.

595. **Bunney, Benjamin S. & Aghajanian, George K.** (Yale U, Medical School) **A comparison of the effects of chlorpromazine, 7-hydroxychlorpromazine and chlorpromazine sulfoxide on the activity of central dopaminergic neurons.** *Life Sciences*, 1974(Jul), Vol 15(2), 309-318.—Small equivalent doses of chlorpromazine and of 7-hydroxychlorpromazine (7-OH-CPZ) reversed amphetamine-produced depression in dopaminergic ventral tegmental neurons of male Charles River albino rats, whereas chlorpromazine sulfoxide was 50-100 times less potent. Findings suggest that 7-OH-CPZ might be a good antipsychotic agent. (27 ref)

596. **Cicero, Theodore J.; Wilcox, Carol E. & Meyer, Edward R.** (Washington U, Medical School) **Effect of  $\alpha$ -adrenergic blockers on naloxone-binding in brain.** *Biochemical Pharmacology*, 1974(Aug), Vol 23(16), 2349-2352.—Studies of the effects of various drugs on the stereoscopic binding of  $^3\text{H}$ -naloxone in rat-brain homogenates indicate that phenoxybenzamine and phenolamine ( $\alpha$ -adrenergic blockers), like morphine, methadone, and codeine, reduce the binding of naloxone in brain.

597. **Cole, Sherwood O. & Gay, Patricia E.** (Rutgers State U, Camden) **Brain mechanisms underlying the effects of amphetamine on feeding and nonfeeding behaviors: Dissociation and overlap.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 80-88.—Reviews literature on the function of amphetamine and discusses 2 brain mechanisms underlying its effects. In nonfeeding behaviors, the brain processes of the drug's action appear to facilitate aminergic processes which directly influence behavior or inhibit cholinergic processes. In feeding

behavior, the processes underlying the drug's action appear to involve a final adrenergic blocking action in the lateral hypothalamus. Although the primary processes are basically different in feeding and nonfeeding behavior, evidence suggests that there is considerable overlap in the complete central systems (primary and modulatory) involved in such mediations.—*Journal abstract*.

598. **Corner, M. A.; Roholl, P. J. & Bot, A. P.** (Central Inst for Brain Research, Amsterdam, Netherlands) **Effects of glutamate on spontaneous electrical activity in the embryonic chick cerebrum.** *Experimental Neurology*, 1974(Aug), Vol 44(2), 229-245.—Injections of sodium levoglutamate in chick embryos after 15-16 days incubation produced precocious electrical patterns approaching the level found normally at 18-19 days of incubation. Since the rise in the level of this amino acid during normal ontogeny also closely paralleled the electrophysiological changes, it is concluded that glutamate might be involved in regulating the timecourse of functional brain development in this species. (52 ref)

599. **Dmowski, W. Paul; Luna, Manuel & Scommegna, Antonio.** (U Chicago, Medical Ctr) **Hormonal aspects of female sexual response.** *Medical Aspects of Human Sexuality*, 1974(Jun), Vol 8(6), 92-113. Reviews the literature on the effects of hormones on sexual function and behavior in both human and animal Ss. It is emphasized that data from these Ss are not comparable, since a variety of psychological and sociocultural factors mediate the effect of hormones on human sexual behavior; libido, frequency of intercourse, and ability to achieve orgasm appear to be independent of estrogen influence. Evidence suggests that androgens have a role in establishing or imprinting a specific pattern of sexual behavior during intrauterine or early neonatal life, while estrogens have shown no such ability. Progesterone has a biphasic effect on sexual activity by first facilitating and then suppressing estrous behavior; large amounts of progesterone effectively block most sexual activity in female mammals. Androgens have a stimulatory effect on sexual drive in women, while progesterone has an inhibitory effect. The role of neuroendocrine substances (e.g., norepinephrine, dopamine, and serotonin) in sexual behavior is also considered, along with the effects of oral contraceptives. (62 ref)—*L. Gorsey*.

600. **Eckardt, Michael J.; Skurdal, Arlie J. & Brown, Judson S.** (U Oregon, Medical School, Portland) **Conditioned taste aversion produced by low doses of alcohol.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 89-92.—Used a taste-aversion paradigm to demonstrate the aversiveness of intraperitoneal injections of alcohol in 56 albino rats. When injections immediately followed the ingestion of an originally preferred flavor, the extent of subsequent aversion to that flavor varied as a function of dosage, the largest dose tested (1.2 g alcohol/kg) causing the strongest aversion. Delayed injections of 1.2 g/kg, however, did not result in significant aversion. Significant aversiveness was also demonstrated in a 2nd experiment which utilized a blind-injection technique with 16 rats given the 1.2-g/kg dose.—*Journal abstract*.

601. **Feder, H. H. & Silver, Rae.** (Rutgers State U, Inst of Animal Behavior, Newark) **Activation of lordosis in ovariectomized guinea pigs by free and esterified**

**forms of estrone, estradiol-17 $\beta$  and estriol.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 251-255.—Determined threshold doses of estradiol-17 $\beta$  estrone, estriol, estradiol-17 $\beta$ -3-benzoate, and estrone-3-benzoate required to activate lordosis in ovariectomized adult Hartley guinea pigs by injecting these steroids in combination with progesterone. The doses of the 3 free steroids which activated lordosis in about 50% of the Ss ranged from 20 to 50  $\mu$ g. Threshold doses of estradiol benzoate and estrone benzoate were only .4 and 1.7  $\mu$ g, respectively. Data indicate that (a) conversion to estradiol-17 $\beta$  is not an absolute requirement for activation of lordosis and (b) esterified forms of estradiol and estrone are far more potent in inducing lordosis than the corresponding free forms of these steroids. (23 ref)—*Journal abstract*.

602. **Feinberg, I.; Hibi, S.; Cavness, C. & March, J.** (VA Hosp, San Francisco, CA) **Absence of REM rebound after barbiturate withdrawal.** *Science*, 1974(Aug), Vol 185(4150), 534-535.—Conducted 3 experiments which showed that administration of 3 different barbiturates reduced rapid eye movement (REM) sleep. In Exp I, 3 schizophrenic patients and 3 patients with personality disorders received placebos for 5 nights, 200 mg of phenobarbital for 4-5 nights, and placebos (withdrawal) for 4-5 nights. In Exp II, 4 medical students were studied for 4 baseline nights, then 1 received 200 mg of secobarbital for 8 nights, and the other 3 received 200 mg of secobarbital for 1 night and 100 mg for 7 nights. In Exp III, after 4 baseline nights, 4 medical students were given 32 mg of amobarbital 2 times/day for 2 days and 3 times/day for 4 days, and were studied for 3 withdrawal nights. Drug withdrawal led to a return to baseline REM values without significant overshoot. Similar results were observed with administration of benzodiazepines in equivalent dosages; therefore, a distinction between these 2 drug classes on the basis of withdrawal effects appears unwarranted. Further study is needed to determine why high REM levels are sometimes associated with the withdrawal of sedative-hypnotic agents.—*Journal abstract*.

603. **Firth, Hugh.** (U Liverpool, England) **Sleeping pills and dream content.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 547-553.—Attempted to replicate a study by D. Carroll (see PA, Vol 45:5788) on the effects of amylobarbitone on dream content. In the present study with 20 male 19-26 yr olds as Ss, both amylobarbitone and nitrazepam were used. Ss received placebos for 1 wk, low doses of the drugs for 1 wk, high doses for the 3rd wk, and placebo for the 4th wk. It was hypothesized that the 2 drugs would reduce the visual aspects of dreaming, make rapid eye movement (REM) sleep more like non-REM sleep (i.e., less "real"), and on withdrawal, produce very visual, active, and unpleasant dreams. Dream reports were collected from Ss before, during, and after drug administration and were rated as conceptual or perceptual and as visually active or passive, and for hostility, anxiety, sexuality, psychotic thinking, bizarreness, and degree of reality. Contrary to prediction, dreams were virtually indistinguishable under the 3 conditions. Nitrazepam made dreams "everyday-ish," and its withdrawal made them bizarre, and withdrawal of amylobarbitone produced exceptionally vivid dreams and nightmares at home, but not in the

laboratory. Reasons for the contrary results are presented. (36 ref)—*L. Gorsey*.

604. **Gauron, Eugene F. & Rowley, Vinton N.** (U Iowa, Medical School) **Effects of chronic methylphenidate administration on learning and offspring behavior.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 157-158.—Chronic administration of methylphenidate to albino rat pups did not affect avoidance learning in adulthood. High dosages and long durations of the drug did decrease body weight. Preliminary evidence of cross-generational methylphenidate effects on learning was also obtained.

605. **Gluck, John P. & Ferraro, Douglas P.** (U New Mexico) **Effects of  $\Delta^9$ -THC on food and water intake of deprivation experienced rats.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 395-401.—Placed 2 groups of 16 male Wistar albino rats each on either a 23-hr food or water deprivation regimen for 150 days. For 12 days following this period of adaptation, half of the Ss in each group were pretreated with an oral dose of 1.0 mg/kg  $\Delta^9$ -tetrahydrocannabinol ( $\Delta^9$ -THC) which was administered immediately after the daily 1-hr access to food and water. During the 12-day treatment phase, all the Ss were administered the drug dose 2 hrs prior to the daily access period. Ss were then returned to nondrug recovery conditions for 8 days. The amount of food and water consumed during the 1-hr access period was increased by  $\Delta^9$ -THC throughout the treatment phase, regardless of Ss' deprivation or pretreatment drug conditions. (16 ref)—*Journal abstract*.

606. **Hartse, K. M. & Rechtschaffen, A.** (U Chicago, Sleep Lab) **Effect of atropine sulfate on the sleep-related EEG spike activity of the tortoise, *Geochelone carbonaria*.** *Brain, Behavior & Evolution*, 1974, Vol 9(2), 81-94.—Investigated the effect of atropine sulfate on EEG spike activity in 10 adult female tortoises. Results support the hypothesis of the existence of an analogy between the reptilian spike and the electrophysiological phenomena of mammalian slow-wave sleep. (25 ref)—*Journal abstract*.

607. **Hitzemann, Robert J.; Hitzemann, Barbara A. & Loh, Horace H.** (Langley Porter Neuropsychiatric Inst, San Francisco, CA) **Binding of  $^3$ H-naloxone in the mouse brain: Effect of ions and tolerance development.** *Life Sciences*, 1974(Jun), Vol 14(12), 2393-2404.—Binding in the brains of male ICR mice was reversed by levorphanol, morphine, and 1-methadone but not by dextrophan. Levorphanol-sensitive  $^3$ -naloxone binding was blocked by Na $^{+}$ , Li $^{+}$ , Ca $^{++}$ , Mg $^{++}$ , and Mn $^{++}$  but not by K $^{+}$ . Highest activity of specific binding was found in the brain nerve-ending particle fraction. Implantation of a 10-mg naloxone pellet increased the apparent total number of binding sites on the 2nd and 3rd days of implantation.

608. **Holloway, Frank A. & Wansley, Richard A.** (U Oklahoma, Health Sciences Ctr, Oklahoma City) **Motivational parameters in ethanol-induced state-dependent dissociation of avoidance learning.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 71-74.—Studied the effects of ethanol on acquisition and retention of a 1-way avoidance response in 160 albino rats as a function of intertrial time on the grid floor (TGF). During acquisition Day 1, ethanol did not affect performance, but Ss

having shorter TGFs required fewer trials. During retraining on Day 2, an overall state-dependent effect was observed (i.e., Ss receiving the same drug on Days 1 and 2 required fewer trials than those receiving different drugs on Days 1 and 2). The nature of these state-dependent effects varied as a function of TGF. The ethanol-saline Ss required more trials to reach criterion than their controls regardless of the TGF, while saline-ethanol Ss required more trials than their controls only at the longer TGF periods. Results suggest that dissociation of learning in the ethanol-saline and saline-ethanol groups may be differentially influenced by certain motivational factors.—*Journal abstract.*

609. Karniol, Isac G. (São Paulo School of Medicine, Brazil) [Effects of marihuana extracts ( $\Delta^1$ - and  $\Delta^9$ -trans-tetrahydrocannabinol in laboratory animals and in human beings: Comparative study.] (Port) *Revista de Psicologia Normal e Patológica*, 1972(Jan), Vol 18(1-2), 85 p.—Assayed the pharmacological potencies of extracts of 3 samples (A, B, and C) of Brazilian marihuana, and 2 active principles:  $\Delta^1$ -THC and  $\Delta^9$ -THC. 4 methods were used: corneal areflexia in rabbits, decrease in spontaneous motor activity and induction of catatonia in mice, and decrease in rope-climbing activity in rats. In all the tests the order of activity was  $B > A > C$  and  $\Delta^1$ -THC  $>$   $\Delta^9$ -THC. The 5 substances were also administered as smoke to 51 human Ss, using standard double-blind procedures. Pulse rate, time discrimination, and psychological effects were recorded. Varied doses provoked a wide range of responses, but the order of activity of the 5 substances was the same for human Ss as for animals. It is concluded that animal tests can predict the potency of marihuana samples in humans. The relative effects of various extracts of marihuana and of other plants are discussed. (English summary) (106 ref)—N. T. Pinckney.

610. Kastin, Abba J. et al. (VA Hosp, Endocrinology Section of the Medical Service, New Orleans, LA) Extinction of an appetitive operant response after administration of MSH. *Hormones & Behavior*, 1974(Jun), Vol 5(2), 135-139.—Trained 24 food-deprived Sprague-Dawley male albino rats to press a lever to obtain food on either a fixed-ratio (FR) 3 or a variable ratio (VR) 3 schedule of reinforcement. Ss trained on the FR schedule and injected with 10  $\mu$ g of synthetic  $\alpha$ -melanocyte-stimulating hormone (MSH) had delayed extinction of the task as compared with the FR controls injected with diluent. There was no difference between the UR groups receiving MSH or diluent. Results show that MSH affects the behavior of rats in another type of behavioral situation involving an appetitive operant response.—*Journal abstract.*

611. Kolodny, Robert C.; Masters, William H.; Kolodner, Robert M. & Toro, Gelson. (Reproductive Biology Research Foundation, St Louis, MO) Depression of plasma testosterone levels after chronic intensive marihuana use. *New England Journal of Medicine*, 1974(Apr), Vol 290(16), 872-874.—Reports that mean plasma testosterone levels were significantly lower in 20 heterosexual 18-28 yr old men who used marihuana at least 4 days/wk for at least 6 mo (with no other drugs) than in age-matched male controls who had never used

marihuana. Data show that the decreased levels were dose related and indicate that chronic use of marihuana may produce alterations in male reproductive physiology through hypothalamic or pituitary action. (19 ref)

612. Krippner, Stanley & Davidson, Richard. (Maimonides Medical Ctr, Dream Lab, Brooklyn, NY) Paranormal events occurring during chemically-induced psychedelic experience and their implications for religion. *Journal of Altered States of Consciousness*, 1974(Spr), Vol 1(2), 175-184.—Reviews the anthropological, anecdotal, clinical, and experimental evidence concerning paranormal phenomena (e.g., telepathy) during psychedelic sessions. It is concluded that although the data are sparse, the implications for religious experience may be of crucial importance. (27 ref)

613. Livrea, P. (U Bari, Clinic for Nervous & Mental Diseases, Italy) [A study of the neurochemical correlates of "akinesia": I. Central dopaminergic, serotonergic and cholinergic activity in catatonia.] (Ital) *Acta Neurologica*, 1974(Jan), Vol 29(1), 1-12.—Measured the concentrations of homovanillic acid (HVA), 5-hydroxy-indoleacetic acid (5-HIAA), and acetylcholine (Ch) in the cerebrospinal fluid (CSF) before and after probenecid in 4 patients with severe catatonic akinesia. Before probenecid, the HVA and 5-HIAA levels were lower than normal and choline levels were normal or higher. The probenecid administration caused a high increase of HVA and 5-HIAA in the CSF, indicating a very high turnover rate of dopamine (3 times normal) and of serotonin (5 times normal). These findings indicate that in catatonic akinesia there is a preponderance of cholinergic activity in the cholinergic-monoaminergic balance, and are consistent with the neurochemical data of parkinsonian and drug-induced akinesia. 614. Lober, Clifford W. (Duke U, Medical Ctr) Case against the use of d-tubocurarine in operant studies of the cardiovascular system. *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1287-1292.—Reviews evidence showing a high degree of integration between the autonomic and somatic systems and suggests that dextrotubocurarine alters both the central and peripheral perception and response patterns. Many of the observations made upon curarized animals can be explained by a central motor theory. Experimental use of curarine is hindered by the release of histamine in response to administration of curarine. Among other artifacts, curarine-induced release of histamine causes a progressive decrease of pulmonary compliance. When artificial respiration is given to curarized animals, the use of positive pressure ventilation and failure to monitor pulmonary gases are further sources of artifacts. It is noted that some investigators use the respiratory rate initially to adjust heart rate to predetermined levels. (47 ref)—*Journal abstract.*

615. Martz, Robert, et al. (Indiana U, Medical School) The effect of marihuana on auditory thresholds. *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 146-148.—Conducted an experimental study in which 8 21-26 yr old men smoked either placebo marihuana cigarettes or marihuana cigarettes prepared to deliver 50 .1-10 of  $\Delta^1$ -tetrahydrocannabinol. Significant increases were found in both heart rate and positive responses on the Cornell

Medical Index. Although 7 Ss felt that for acuity was improved, changes in Békésy thresholds from .125 to .128 kHz could not be clearly demonstrated.—*Journal summary*.

616. Mead, Philip G. (Keuka Coll) **Effects of overtraining and pretrial administration of dextroamphetamine on reversal learning in rats.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 566.—Trained 20 adult male Long-Evans rats on a brightness discrimination reversal problem containing 1 irrelevant dimension. Prior to being tested, half of the Ss received a 2-mg/kg injection of dextroamphetamine, and half received a 2-mg/kg dose of saline. Each group was further divided so that half of the Ss received 100 postcriterion trials, while the rest were trained only to criterion. Results reveal an overtraining reversal effect but no difference between scores across the drug groups. Findings are discussed in terms of dosage levels, anorexia, and selective attention.—*Author abstract*.

617. Moskowitz, Herbert & Sharma, Satanand. (U California, Inst of Transportation & Traffic Engineering, Los Angeles) **Effects of alcohol on peripheral vision as a function of attention.** *Human Factors*, 1974(Apr), Vol 16(2), 174-180.—Tested 12 male paid college students under a control treatment and 2 alcohol treatments in a perimeter apparatus used for testing peripheral vision. Ss were required to fixate either on a steady-state central fixation light and to detect peripheral lights, or to count blinks produced by the cessations of the fixation light and to detect peripheral lights. Alcohol produced an impairment of peripheral vision only under conditions where the central fixation light blinked and thus required information processing. No performance decrement occurred when the central light did not blink. Results suggest that alcohol interferes with central information processing rather than peripheral sensory mechanisms.—*Journal abstract*.

618. Nazar, Barry L.; Harclerode, Jack; Roth, Robert I. & Butler, R. Christopher. (Bucknell U) **Acquisition of tolerance to  $\Delta$ -9-THC as measured by the response of a cellular function.** *Life Sciences*, 1974(Jun), Vol 14(12), 2513-2520.—Investigated the development of tolerance to delta-9-tetrahydrocannabinol ( $\Delta$ -9-THC) by measuring respiration in brain tissue. Male Swiss albino mice were given either single or 7 daily repeated intraperitoneal injections of 50 mg/kg  $\Delta$ -9-THC or control vehicle. The final injection for all drug-treated Ss included  $^3$ H- $\Delta$ -9-THC. Ss were sacrificed at 1, 2, 4, or 24 hrs or 7 days after the final injection.  $\Delta$ -9-THC depressed respiration, but after repeated injections was significantly less effective in this regard, indicating acquisition of tolerance to  $\Delta$ -9-THC. Because the concentration of radiolabeled cannabinoids in brain tissue from each group is not appreciably different, a cellular as opposed to distributional mode of tolerance is suggested. (15 ref)—*Journal abstract*.

619. Perumal, T. A. & Prakasa Rao, J. (Christian Medical Coll, Velore, India) **Effect of pharmacological blockade on lithium-induced water drinking.** *British Journal of Pharmacology*, 1974(May), Vol 51(1), 107-108.—Intraperitoneal administration of lithium chloride led to a significant increase in the 24-hr water intake of rats. Prior administration of propranolol and haloperidol

blocked the effect of lithium, while atropine did not. The dipsogenic effect of lithium is probably exerted through  $\beta$ -adrenergic and dopaminergic pathways.

620. Porterfield, Al L. & Stern, Jeffrey J. (U Michigan, Dearborn) **Growth hormone and the refractoriness of the prepubertal activity system to estradiol in the rat.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 23-25.—Studied the relationship between growth hormone (GH) and the inability of estradiol to stimulate running in 30 immature female rats. Ss were hypophysectomized and ovariectomized at 21 days old. Starting on Day 25, Ss received either 10  $\mu$ g estradiol benzoate (EB) and isotonic saline or 10  $\mu$ g EB and 1 mg bovine GH. Ss given EB displayed adult running; those given EB and GH showed prolonged juvenile activity. Results demonstrate that GH contributes to the refractoriness of the prepubertal activity system to estradiol. Estrogen also produced a weight loss and precocious vaginal canalization. (20 ref)—*Journal abstract*.

621. Quimby, Kelvin L. et al. (U Wisconsin, Madison) **Enduring learning deficits and cerebral synaptic malformation from exposure to 10 parts of halothane per million.** *Science*, 1974(Aug), Vol 185(4151), 625-627.—Chronic exposure of Sprague-Dawley rats to halothane (10 ppm) during early life produced later deficits in learning a shock-motivated light-dark discrimination and a food-motivated maze pattern, correlated with enduring synaptic membrane malformation in cerebral cortex. Adult exposure had no effect. Halothane may provide a useful analytical tool for study of brain. The behavioral-ultrastructural techniques also suggest a standard for assessing the safety of trace toxicants with central nervous system effects.—*Journal abstract*.

622. Reigle, Thomas G. et al. (Massachusetts Mental Health Ctr, Neuropsychopharmacology Lab, Boston) **Norepinephrine metabolism in the rat brain following acute and chronic administration of thyrotropin releasing hormone.** *Psychopharmacologia*, 1974, Vol 37(1), 1-6.—Administered synthetic thyrotropin releasing hormone (TRH) intraperitoneally to male Sprague-Dawley albino rats to determine the effects of this drug on norepinephrine- $H^+$  metabolism in the brain. With the possible exception of a slight enhancement of release, acute or chronic administration of TRH had little effect on the disposition and metabolism of norepinephrine- $H^+$  in rat brain. In addition, no significant changes were found in brain levels of endogenous norepinephrine, serotonin, or dopamine following the injection of TRH. Thus, little evidence was found to support a possible relationship between the reported clinical antidepressant activity of TRH and its effects on norepinephrine metabolism in brain. (16 ref)—*Journal abstract*.

623. Reynierse, James H. & Balkema, Larry. (Hope Coll) **Effects of progesterone and nesting materials on response prevention and extinction of avoidance in ovariectomized female rats.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 425-428.—48 albino ovariectomized female Sasco rats received either progesterone or oil injections prior to learning a simple 1-way avoidance response. During a 10-min response prevention procedure, half of the Ss in each group had nesting materials present, while the remaining Ss did not. The availability of nesting material during response preven-

tion hastened extinction independent of progesterone injections.—*Journal abstract.*

624. Robinson, Gordon H. & Peebles, Warren J. (U Wisconsin, Madison) **Interactions between alcohol, task difficulty, and compatibility in a choice-reaction task.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 459-466.—Examined the effects of alcohol stress on choice reaction-time tasks of differing difficulty (response alternatives) and compatibility (stimulus-response mapping). Ss were 30 male undergraduates who described themselves as moderate social drinkers. Performance decrement under alcohol stress depended on the interaction of task difficulty and compatibility, low compatibility having a larger effect in more difficult tasks. (20 ref)—*Journal abstract.*

625. Schmaltz, Gerard & Delerm, Bernard. (U de Lille, Lab of Psychophysiology, France) **[Effects of cycloheximide on acquisition and retention of an avoidance learning in the rat: Recovery of memory.]** (*Fren Physiology & Behavior*, 1974(Aug), Vol 13(2), 211-220.—30 min before an avoidance learning session in a Y maze, 401 male Sprague-Dawley rats were given a subcutaneous injection of either cycloheximide or saline. Ss were trained to a criterion of 4 or 8 consecutive avoidance responses. Retention tests were given 2 hrs, 24 hrs, or 6 days after initial learning. Results show (a) acquisition was not affected by the severe protein synthesis inhibition, (b) impairment of memory was found in the low-criterion experimental group 2 hrs after learning and in both experimental groups 24 hrs after learning, and (c) a recovery of memory was observed in both groups 6 days later. A control experiment indicated that the deficits found were not retrieval deficits. Transient amnesia is interpreted in terms of slowing down in long-term memory establishment process, and this is thought to be due to a decrease in the rate of neurotransmitter synthesis. (37 ref)—*English abstract.*

626. Seegal, Richard & Denenberg, Victor H. (U Connecticut) **Maternal experience prevents pup-killing in mice induced by peripheral anosmia.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 339-341.—Used a 2 × 2 design with 30 nulliparous and 30 multiparous Swiss albino mice in which experience and anosmia were manipulated. Anosmia induced by zinc sulfate flush of the nasal epithelium resulted in pup-killing in 13 of 15 primiparous litters, whereas only 2 of 15 multiparous Ss were pup-killers. Results suggest that primiparous mothers depend heavily on olfaction and that a dichotomy exists between the peripheral chemical-induced anosmia (modifiable by experience) and the central, whole-bulb aspiration-induced anosmia, not modifiable by experience.—*Journal abstract.*

627. Stein, Donald G. (Clark U) **The effects of early saline injections and pentylenetetrazol on Hebb-Williams maze performance in the adult rat.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 415-422.—Gave 41 male Charles River CD strain albino rats intraperitoneal injections of either saline or 15 mg/kg pentylenetetrazol (PTZ) from 15 to 35 days of age, and then again at maturity, prior to testing in a Hebb-Williams maze. Ss given saline while immature and again as adults made more errors than 10 Ss never injected or than 10 Ss receiving saline only as adults. Ss receiving PTZ during

development and/or at maturity performed as well as nontreated controls, suggesting that the drug may have counteracted the disrupting effects of the early injections. Injections at maturity were given on alternate days of testing, and all Ss made significantly more errors on days in which treatments were given. Thus, even saline injections can have an immediate effect on performance and can influence behavior of noninjected animals tested in the same apparatus. (25 ref)—*Journal abstract.*

628. Stokes, John D. & Scudder, Charles L. (Loyola U, Strick School of Medicine, Inst for the Study of Mind, Drugs & Behavior, Maywood, IL) **The effect of butylated hydroxyanisole and butylated hydroxytoluene on behavioral development of mice.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 343-350.—The chronic ingestion of .5% butylated hydroxyanisole (BHA) or butylated hydroxytoluene (BHT) by pregnant Swiss-Webster mice and their offspring resulted in a variety of behavioral changes. Compared to controls, BHA-treated offspring showed increased exploration, decreased sleeping, decreased self-grooming, slower learning, and a decreased orientation reflex. BHT-treated offspring showed decreased sleeping, increased social and isolation-induced aggression, and a severe deficit in learning. (22 ref)—*Journal abstract.*

629. Stratton, Lois O. & Kastin, Abba J. (Louisiana State U, New Orleans) **Avoidance learning at two levels of shock in rats receiving MSH.** *Hormones & Behavior*, 1974(Jun), Vol 5(2), 149-155.—Trained 32 male Long-Evans rats who received either synthetic  $\alpha$ -melanocyte-stimulating hormone (MSH) or a control diluent in a 2-way shuttle box to avoid shock at 2 intensity levels (.3 and .9 mA). At the low level, MSH improved acquisition, but at the high shock level, MSH rats tended to perform more poorly but were not significantly different from controls. No differences were found in measures of activity or excitability, but higher defecation rates, which may indicate greater emotionality, were observed in Ss receiving high levels of shock and in Ss receiving MSH. Data suggest that MSH may facilitate learning at low, but not at high, levels of shock.—*Journal abstract.*

630. Tart, Charles T. & Kvstensky, Erma. (U California, Davis) **Marijuana intoxication: Feasibility of experiential scaling of level.** *Journal of Altered States of Consciousness*, 1973(Fal), Vol 1(1), 15-21.—On a mailed questionnaire, 40 experienced college users reported psychological factors could markedly alter their response to marijuana, indicating that quantity of drug ingested may not be an adequate measure of the psychological construct of the "level of intoxication" of the altered state of consciousness produced by marijuana. Users showed a highly reliable set of experiential criteria for scaling level, suggesting the usefulness of this psychological approach as an alternative and/or supplement to a pharmacological approach.—*Journal abstract.*

631. Tecce, Joseph J. & Cole, Jonathan O. (Boston State Hosp, Lab of Neuropsychology, MA) **Amphetamine effects in man: Paradoxical drowsiness and lowered electrical brain activity (CNV).** *Science*, 1974(Aug), Vol 185(4149), 451-453.—13 of 20 paid adult volunteers given 10 mg of dextroamphetamine exhibited paradoxical drowsiness accompanied by lowered electrical brain activity (contingent negative variation, or

CNV) in the 1st hr postdrug. During this period, 7 Ss showed behavioral alertness and increased CNV amplitude. Both groups of Ss showed heightened alertness 2 and 3 hrs postdrug. It is concluded that amphetamine is not a simple stimulant of the central nervous system but can also act as a depressant.—*Journal abstract.*

632. Thomsen, Klaus & Olesen, O. Vendelin. (Aarhus U, Inst of Psychiatry, Risskov, Denmark) **Long-term lithium administration to rats: Lithium and sodium dosage and administration, avoidance of intoxication, polyuric control rats.** *International Pharmacopsychiatry*, 1974, Vol 9(2), 118-124.—Gave lithium-containing foods to 5 Brattleboro strain rats with hereditary hypothalamic diabetes insipidus. 5 additional Ss served as controls. During the 1st wks the lithium content of the food was 40 mM/kg. To obtain a serum lithium level comparable to that used in treatment of patients, however, the lithium content of the food had to be raised to 60 mM/kg. Within a few days with this lithium intake, Ss developed signs of intoxication, loss of weight, and decrease of fluid intake. The condition was reversed by giving the Ss a free choice between .9% NaCl and tap water. With this regimen a stable serum lithium concentration of .8 mM was maintained for 2 mo without any signs of intoxication. The lithium-treated Ss drank more saline than did the controls. During the following 2 mo, the mean serum lithium concentration was 1.1 mM and no signs of intoxication occurred. The administration of extra sodium to the lithium-treated Ss did not abolish the lithium-induced lowered antidiuretic response to vasopressin. Results show that by appropriate administration of lithium and sodium intakes it is possible to maintain rats at a serum lithium level of .7-1 mM for long periods of time without signs of intoxication and with the same body weight as controls.—*Journal abstract.*

633. Thornton, William E. & Thornton, Bonnie P. (Naples Community Hosp, FL) **Narcotic poisoning: A review of the literature.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 867-869.—Presents a review of the literature on adverse physical reactions to narcotic drugs. Findings indicate a morbid physical prognosis for the habitual narcotics user. The need for increased prevention and treatment interventions by the medical and nursing professions is emphasized. (46 ref)

634. Tyler, John D. (U North Dakota) **Extinction of conditioned fear: A test of Wolpe's reciprocal inhibition hypothesis.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 127-137.—Tested J. Wolpe's (see PA, Vol 27:4990) reciprocal inhibition hypothesis, which states that fear can be reduced by (a) presenting the fear stimulus, (b) omitting noxious reinforcement, and (c) suppressing fear. 72 DBA/2 mice were given fear acquisition training. Next, a group that received both a drug and extinction-trial (DE), and a conventional experimental-extinction-trial group, were administered conditioned-stimulus (CS) alone trials while drugged with chlorpromazine and saline, respectively. Drug-only (D) Ss and no-treatment controls were injected with chlorpromazine and saline but were not exposed to the CS. Reciprocal inhibition hypothesis predictions were not supported in postextinction tests. The DE mice extinguished with chlorproma-

zine either did not differ from controls or displayed greater fear. (22 ref)—*Journal abstract.*

635. Whalen, Richard E. & Rezek, Donald L. (U California, Irvine) **Inhibition of lordosis in female rats by subcutaneous implants of testosterone, androstenedione or dihydrotestosterone in infancy.** *Hormones & Behavior*, 1974(Jun), Vol 5(2), 125-128.—Implanted 40 female Sprague-Dawley rats on the day of birth with Silastic capsules containing nonesterified testosterone, androstenedione, or dihydrotestosterone. The date of vaginal opening was assessed until sacrifice. Ss were ovariectomized, treated with estradiol benzoate and progesterone, and tested for the display of lordosis. Ss were then administered testosterone propionate and the size of the phallus was taken. Testosterone and dihydrotestosterone completely inhibited vaginal opening; androstenedione was partially effective. Testosterone almost completely inhibited lordosis behavior; androstenedione was partially effective and dihydrotestosterone was ineffective. All 3 androgens facilitated phallic development.—*Journal abstract.*

636. Whalen, Richard E. (U California, Irvine) **Estrogen-progesterone induction of mating in female rats.** *Hormones & Behavior*, 1974(Jun), Vol 5(2), 157-162.—Administered 43 ovariectomized female Sprague-Dawley rats 1, 2, 4, and 8 µg of estradiol benzoate and either 10, 25, 50, 100, or 200 µg of progesterone. Ss were then tested for sexual receptivity. The probability of lordosis was related directly to the dose of both steroids. Individual differences in hormone response were marked. Ear wiggling and hopping were primarily related to the dose of progesterone.—*Journal abstract.*

637. Winocur, Gordon & Bagchi, S. P. (Trent U) **Effects of bufotenine and p-chlorophenylalanine on reactivity to footshock.** *Physiological Psychology*, 1974(Mar), Vol 2(1), 75-79.—Conducted 2 experiments in which groups of albino rats were injected with bufotenine, parachlorophenylalanine (PCPA), bufotenine + PCPA (B + PCPA), or saline, and their reactions to footshock were recorded during tests of distractibility and response thresholds. Bufotenine consistently decreased sensitivity to shock, while PCPA consistently increased it. Individual effects of bufotenine and PCPA were not apparent in the B + PCPA groups, which behaved like saline control groups. Results support the hypothesis that bufotenine and PCPA affect reactivity to external stimuli in opposite ways. (15 ref) —*Journal abstract.*

638. Wurtman, Richard J.; Larin, F.; Mostafapour, S. & Fernstrom, J. D. (Massachusetts Inst of Technology, Lab of Neuroendocrine Regulation) **Brain catechol synthesis: Control by brain tyrosine concentration.** *Science*, 1974(Jul), Vol 185(4146), 183-184.—Estimated brain catechol synthesis in male rats by measuring the rate at which brain dopa levels rose following decarboxylase inhibition. Dopa accumulation was accelerated by tyrosine administration, and decreased by treatments that lowered brain tyrosine concentrations (e.g., intraperitoneal tryptophan, leucine, or parachlorophenylalanine). A low dose of phenylalanine elevated brain tyrosine without accelerating dopa synthesis. Findings suggest that nutritional and endocrine factors might

influence brain catecholamine synthesis by controlling the availability of tyrosine.—*Journal abstract.*

639. Yagiela, John A.; McCarthy, Ken D. & Gibb, James W. (U Utah, Coll of Pharmacy) **The effect of hypothermic doses of 1- $\Delta^9$ -tetrahydrocannabinol on biogenic amine metabolism in selected parts of the rat brain.** *Life Sciences*, 1974(Jun), Vol 14(12), 2367-2378.—The dose-dependent fall in body temperature induced by 1- $\Delta^9$ -tetrahydrocannabinol (THC) was rapid in onset and prolonged in duration, unaccompanied by any observed alteration in the concentration or turnover rate of 5-hydroxytryptamine. Norepinephrine (NE) was also unchanged, with the exception of a reduction in the amount of brainstem NE 30 min after the administration of 50 mg/kg THC. (26 ref)

640. Zamble, Edward. (Queen's U, Kingston, Ontario, Canada) **Pavlovian appetitive conditioning under curare in rats.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 101-105.—Conducted 2 experiments with 6 and 10 male Sprague-Dawley albino rats, respectively, in which a conditioned stimulus (CS) was paired with rewarding intracranial stimulation while Ss were immobilized by curare. Tests of the activity response to the CS were carried out before and after conditioning. With either simple or discriminative conditioning, activity to the rewarded CS increased after training. Results are comparable to those in studies using food reward and support the hypothesis that a central motivational state is conditioned to stimuli preceding reward.—*Journal abstract.*

## ANIMAL PSYCHOLOGY

641. Bronstein, Paul M.; Neiman, Howard; Wolkoff, F. Dmitri & Levine, M. Joy. (Brooklyn Coll, City U New York) **The development of habituation in the rat.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 92-96.—In each of 2 studies, Sprague-Dawley albino rats of different ages (8 each at 15, 21, and 100 days old in Exp I and 11 each at 15 and 21 days old in Exp II) were given 1 prolonged open-field trial. Ss of 21 days and older displayed within-session activity decrements, while 15-day-old Ss failed to habituate. The abrupt transition from a pattern of nonhabituation to one of habituation to a novel environment parallels the development of forebrain cholinergic mechanisms during the 3rd and 4th postnatal weeks. Results conform to the suggestion that the 2-wk-old rat is behaviorally similar to the hippocampectomized adult. (23 ref)—*Journal abstract.*

642. Bruen, Katri & Dunham, D. W. (Wright State U.) **Effects of social stimuli on nest building in the zebra finch (*Poephila guttata*).** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 183-190.—Under experimental conditions with a total of 69 Ss, the sight and sound of a conspecific was conducive to nest building in domesticated male grey zebra finches, but sounds from unseen nearby conspecifics blocked this stimulating effect. The sight and sound of nearby conspecifics, in addition to a single female cagemate, suppressed the rate of nest building, lowered building efficiency, and increased general activity. It is suggested that the close proximity of conspecifics evokes a flocking tendency that interferes

with nest building. If this inference is correct, one of the selective advantages in the spatial separation of flocking and nesting areas, and in the wide spacing of nests in the colony, is avoidance of social stimuli that interfere with nest building.—*Journal abstract.*

643. Dewsbury, Donald A. (U. Florida) **The use of muroid rodents in the psychology laboratory.** *Behavior Research Methods & Instrumentation*, 1974(May), Vol. 6(3), 301-308.—Describes the potential uses, taxonomy, and husbandry of the rodent superfamily Muroidea, a group of animals with much potential for comparative behavioral study. The superfamily—including Old World rodents, gerbils, hamsters, New World rats, mice, and voles—are readily acquired, easy to maintain, and exist with sufficient ecological and behavioral diversity to enhance the likelihood of significant results. (45 ref)

644. Dimond, S. & Lazarus, J. (University Coll, Cardiff, Wales) **The problem of vigilance in animal life.** *Brain, Behavior & Evolution*, 1974, Vol 9(1), 60-79.—Discusses vigilance as an important facet of animal life, particularly in relation to 3 areas: external danger, the exploitation of environmental resources, and intraspecific communication. The 2nd of these involves, in addition to vigilance, an active search of the environment. The organization of the nervous system imposes certain limitations on the effectiveness of vigilance, and these are described with particular reference to experimental studies of vigilance in man. 3 types of strategy are delineated which function to offset the neural limitations on vigilance; neural mechanisms, individual behavioral strategies, and social strategies. These are considered in relation to those areas of life already defined as requiring a watchkeeping function. (3½ p ref)—*Journal abstract.*

645. Haude, Richard H. & Ray, Oakley S. (U Akron) **Visual observing behavior in the squirrel monkey.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 138-140.—Tested 10 male squirrel monkeys to determine whether visual observing behavior could be measured using a technique developed for rhesus monkeys. Ss engaged in visual observation of a set of projected color slides of other squirrel monkeys to an extent comparable with visual observation by rhesus monkeys. Significant differences in both mean cumulative viewing time and mean frequency of visual observing were found for the different visual incentive conditions used. Previous reports of a low level of visual attention by squirrel monkeys were not confirmed.—*Journal abstract.*

646. Helligenberg, Walter. (Max Planck Inst. for Behavioral Physiology, Seewiesen, W. Germany) **Random processes describing the occurrence of behavioural patterns in a cichlid fish.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 169-182.—Correlation patterns found for 7 measured behaviors of male cichlids suggest that the behaviors share at least 4 slow basic processes which to different extents contribute to long-term fluctuations in the rate of different behaviors. A linear model representing slow fluctuations in the rate of a particular behavior as a linear combination of 4 basic processes yields a reasonable approximation to the long-term correlation pattern observed.

647. Holliday, D. V. (Tracor, San Diego, CA) **Doppler structure in echoes from schools of pelagic fish.** *Journal of the Acoustical Society of America*,

1974(Jun), Vol 55(6), 1313-1322.—Measured the Doppler spread-at-side aspect of 3 schools of fish and related it to swimming motions by a simple algebraic model based on R. Bainbridge's (1958) equation relating fish swimming speed, length, tail-beat amplitude, and tail-beat frequency. The mathematical model was used to estimate the length of the fish in 2 of the schools. Near head or tail aspect, the observed Doppler structure appeared to be related to behavioral swimming characteristics.

648. Impeken, Monica. (Rutgers State U., Inst. of Animal Behavior, Newark) **Response-contingent prenatal experience of maternal calls in the Peking duck (*Anas platyrhynchos*).** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 164-168.—Investigated whether Peking duck embryos, exposed to (mallard or chicken) maternal calls presented to them in response to their foot movements (as indicator of their motor activity) on the day before hatching, differed in their responsiveness from other embryos exposed to the same calls but not contingent upon their own movements. Results show that response rate was significantly increased to the mallard maternal call, but not to the chicken maternal call, as a function of the contingency. (20 ref)—*Journal abstract*.

649. Jones, R. B. & Nowell, N. W. (U Hull, England) **A comparison of the aversive and female attractant properties of urine from dominant and subordinate male mice.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 141-144.—Tested the urine of 10 individual dominant and 10 subordinate male Tuck T. O. strain mice for male-aversive and female-attractant properties using 20 dominant and subordinate male Ss and 20 estrous and anestrus female Ss in open-field tests. Results indicate (a) the presence of a factor in the urine of dominant males which proved aversive to both dominant and subordinate Ss, (b) the presence of a female attractant in the urine of dominant males, and (c) naive females had to be in estrus to respond positively to male urine. Results are discussed in terms of preputial and coagulating gland contents, androgen levels, and possible territorial functions.—*Journal abstract*.

650. Kuenzle, Clive C. & Knüsel, Alois. (U Zurich, School of Veterinary Medicine, Switzerland) **Mass training of rats in a superenriched environment.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 205-210.—Describes an apparatus that was designed and used for the simultaneous training of 70 male albino rats without requiring much effort from the E. The apparatus is based on an enriched environment and confronts the Ss with true learning situations. The Ss learned to traverse a maze and to select and open appropriate gates in order to get access to either food or water. The number of tasks and their complexity were gradually increased during a training period of 29 days. The apparatus offers a convenient means for supplying the investigator with a large number of trained animals in studies aimed at correlating behavior with brain morphology and biochemistry.—*Journal abstract*.

*Behavior Research Methods & Instrumentation*, 1974(May), Vol. 6(3), 325-326.

652. MacKinnon, John. (U Oxford, Animal Behaviour Research Group, England) **The behaviour and ecology of wild orang-utans (*Pongo pygmaeus*).** *Animal Behaviour*, 1974(Feb), Vol 22(1), 3-74.—Spent 21 mo of fieldwork studying wild populations of orangutans in Borneo and Sumatra. 1,500 hrs of daylight observation were made. In contrast to other higher primates, the dispersed distribution of food and the orangutan's slow mode of travel seem to favor solitary habits. Over 80% of foraging units seen contained only 1 independent animal, either alone or with dependent young. Larger groupings were seen when adolescents joined up with other animals or when males and females formed temporary consortships for mating purposes. Comparison between several populations revealed an interesting mechanism for the natural regulation of animal numbers. Differences between Bornean and Sumatran orangutans are discussed in relation to the zoogeography of these 2 islands. (116 ref)—*Journal abstract*.

653. Malcolm, William M. & Hanks, Jess P. (Rutgers State U., New Brunswick) **Landing-site selection and searching behaviour in the micro-lepidopteron *Agonoterpis pulvipennella*.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 45-48.—Observations indicate that the cryptic micro-lepidopteron (Oecophoridae) camouflages itself against predators by distinguishing among several shades of grey and preferring landing sites that match the reflectance of its forewings. Variations in the time it spends searching out a site are of survival value.

654. Mitchell, K. A. (U Glasgow, Scotland) **Activities of two British species of *Pagurus* (Crustacea, Decapoda, Paguroidea).** *Marine Behaviour & Physiology*, 1974, Vol 2(3), 229-236.—Results of 2 series of experiments show that the hermit crab *P. bernhardus* was more active during day than night, whereas the opposite was true of *P. prideauxii*. Under periods of 24 hrs constant illumination, the activity pattern of *P. bernhardus* persisted to a lesser degree but *P. prideauxii* showed no activity pattern.

655. Morgret, Morris K. & Albee, Paul R. (Washington State U.) **An automated open-field apparatus utilizing an improved resistance detection circuit.** *Behavior Research Methods & Instrumentation*, 1974(May), Vol. 6(3), 327-328.

656. Nadler, Ronald D. (Yerkes Regional Primate Research Ctr, Emory U) **Peripartuitional behavior of a primiparous lowland gorilla.** *Primates*, 1974(Mar), Vol 15(1), 55-73.—Observed and recorded the behavioral interactions of a primiparous lowland gorilla and her newborn female infant during the birth of the infant and the subsequent 27 hrs. The mother's behavior, initially unresponsive to the infant, progressed rapidly through a series of interactions that are described as preliminary to, and perhaps essential for, the ultimate development of appropriate maternal behavior. The relationship between the following different critical activities is discussed: (a) the ingestion of birth fluids by the mother and the establishment of initial contact with the infant, (b) the progression from impersonal contact to ventral-ventral contact, and (c) the coordination between the mother's and infant's vocalizations and activity preceding nursing. (33 ref)—*Journal abstract*.

657. Norton, Thomas T. (U Pennsylvania, Medical School) **Receptive-field properties of superior colliculus cells and development of visual behavior in kittens.** *Journal of Neurophysiology*, 1974(Jul), Vol 37(4), 674-690.—Studied the relationship between the development of receptive field properties in the stratum griseum superficiale of the superior colliculus and the development of visually guided behaviors in 27 10-39 day old kittens. Comparative electrophysiological data from 4 adult cats indicate that immature receptive fields acquired more adult receptive field properties by 15 days of age and continued to change until at least 25 days in the case of 4 of 5 receptive field properties and 35 days for the 5th property, direction selectivity. Tests of visual and auditory behavior conducted before the electrophysiological recordings showed that (a) 2 visually guided behaviors (orienting to a visual stimulus and following it) could be elicited in Ss tested at 16 and 18 days of age, respectively; (b) the onset of these behaviors coincided with the period of rapid change from the immature to the mature state of the receptive fields; and (c) auditory orienting and following responses appeared before visual orienting and following. (52 ref)—*Journal summary*.
658. Ohashi, M.; Kurisu, S.; Imai, H. & Murakami, H. (Kobe U, Japan) **Inexpensive digital recorder for measuring the activity of mice.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 321-325.—Describes a device which registers the frequency of electric pulses generated by the activity of the mice on a counter and automatically photographs the registered count with a camera at specific times. Data obtained through the apparatus coincide satisfactorily with values observed by the kymographic method.
659. Ollason, Janet C. & Slater, Peter J. (U Sussex, School of Biology, Brighton, England) **Changes in the behaviour of the male zebra finch during a 12-hr day.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 191-196.—During a 12-hr day (from 7 AM to 7 PM), 75% of the movement of each of 10 male finches between perches occurred between 8 AM and 2 PM. Trends were apparent in other behaviors, as assessed by the number of 30-sec time units in which they were recorded. Soft call notes, singing, drinking, and taking of sand and cuttlefish bone declined during the day, and sitting still and preening rose.
660. Rydén, Olof. **Responses to an alarming auditory stimulus as affected by massive earlier exposure: A combined field- and laboratory experiment with great tit nestlings (*Parus major*).** *Psychological Research Bulletin, Lund University*, 1974, Vol 14(3), 26 p.—Exposed 3 11-14 day old Great Tit nestlings to 2 hrs of intermittent replays of an alarm note before feedings when the parents were not present and in connection with simulated attacks on the home cage or with the display of a stuffed predator. Results show that (a) Ss exhibited a constant tendency to withdraw from stimuli similar to the alarm note based on an early preference for sounds with opposite qualities and (b) the 3 environmental conditions had transient effects on this tendency. (25 ref)
661. Suthers, Roderick A. & Fattu, James M. (Indiana U.) **Fishing behaviour and acoustic orientation by the bat (*Noctilio labialis*).** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 61-66.—Found that this species of bat, previously believed to feed entirely on aerial insects, captures aquatic food by dipping its feet into water. Small bits of food on the water's surface were echolocated at a range of about 1 m. The most common orientation cry began with an almost constant frequency of 70 kHz which was then frequency modulated to about 40 kHz. (18 ref)
662. Tortora, Daniel F.; Eyer, Jerry C. & Overmann, Stephen R. (Michigan State U) **The effect of sand deprivation on sandbathing and marking in Mongolian gerbils (*Meriones unguiculatus*).** *Behavioral Biology*, 1974(Jul), Vol 11(3), 403-407.—Observed the behaviors of 20 Mongolian gerbils after 0, 2, 4, 6, and 8 days of sand deprivation. The frequency of 3 behavioral components of sandbathing significantly increased as a function of deprivation. Deprivation also significantly increased territorial marking, and as expected, males marked more frequently than females. Results are examined in terms of an oil-regulation hypothesis for sandbathing. The effects of deprivation support the hypothesis.—*Journal abstract*.
663. Van Deventer, John. (U Wisconsin Ctr, Marshfield) **The feeding latencies of two species of planaria.** *Psychological Record*, 1974(Sum), Vol 24(3), 373-377.—Results of studies with the planaria *Cura foremanii* and *Dugesia tigrina* show that there were no significant differences between the mean feeding latencies of the Control, Handled, and Familiarized groups; food size affected the frequency of *C. foremanii* eating (but not *D. tigrina*) but not feeding latency, and prior handling decreased the feeding latency for *D. tigrina*. It is concluded that failure to replicate J. B. Best and I. Rubenstein's (see PA, Vol 37:2701) results may indicate that *C. foremanii* may not be as reliable a laboratory animal as *D. tigrina*.
664. Webb, Wilse B. (U Florida) **Sleep as an adaptive response.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1023-1027.—Suggests that sleep is an adaptive nonresponse and that the sleep characteristics of particular species reflect the adaptive requirements for nonresponding in the ecological niche of species. The ecological conditions which would modify sleep length, intermittency, and diurnal placement are discussed. Sleep is viewed as a form of instinctive behavior rather than as a nutritional or need satisfying state.—*Journal abstract*.
665. Wells, Annie; Jones, Atlas; Williams, Marvin & Geist, Charles R. (Lincoln U) **Noise, vitamin A deficiency, and emotional behavior in rats.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 392-394.—Investigated the effects of aversive stimulation (loud noise) on the emotionality of 21 male albino Holtzman rats which were food-deprived, satiated, or vitamin A deficient. Activity (number of squares traversed in an open-field task) and defecation scores comprised the measures of emotion. Significantly more boli were recorded for food-deprived Ss than satiated Ss, while the number of boli for vitamin A deficient Ss was in between. Noise significantly increased the number of boli for all groups. Deprivation conditions, noise-no noise, and the interaction of these variables were all significant on activity scores. Food-deprived Ss were the most active, satiated Ss the least active, and again vitamin A deficient Ss fell in

between. Groups were more active with noise. The significant interaction probably resulted from the marked increase in activity by deprived Ss under noise. Thus, aversive stimulation may have greater effect on animals already under stress from food deprivation than on satiated animals.—*Journal abstract*.

666. Woodard, William T. & Bitterman, M. E. (U. Hawaii) Improved techniques for the measurement of consummatory behavior in fishes. *Behavior Research Methods & Instrumentation*, 1974(May), Vol. 6(3), 321-324.

667. Zachman, T. A.; Bell, R. W.; Nitschke, W. & Irwin, B. (Northern Illinois U) Ultrasonic signaling in three inbred strains of mice. *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 137-145.—Subjected 3 litters each of 3 inbred strains of mice (C57BL/6/J, Balb/c/J, C3H/He/J) to 2 temperature parameters: 23.5° C (ambient temperature) and 0° C (cold stress parameter). Ultrasonic recordings of the animal signals were taken at 3, 6, 9, 12, and 15 days of age. The recordings were analyzed for mean peak frequency and for duration and rate of the signals. The number of signals differed significantly between 3 and 6 days; the C57BL/6/J ceased signaling by 6 days while by 12 days only the cold-stressed C3H/H3/J pups were emitting signals. At 3 days all strains differed significantly as a function of signal duration. At 3, 6, and 9 days, 2 of the strains appeared to emit significantly longer signals under cold stress. The mean peak frequency of the signals differed significantly across strains. However, the parameter of cold stress did not appear to affect the signal frequency for any of the strains. The following conclusions are drawn: (a) the suggestion of some type of strain-specific frequency coding; (b) the possibility of differences in the development of homeothermia across strains; and (c) the indication that critical periods for neonatal development may exist.—*Journal summary*.

### Learning & Motivation

668. Aoyagi, Hajime. (Waseda U, Tokyo, Japan) [The effect of partial- and non-reward followed by continuous reward upon extinction to resistance.] (Japn) *Annual of Animal Psychology*, 1972(Nov), Vol 22(1), 9-20.—Studied the effect of partial reinforcement on later extinction. 30 male albino rats received 90 training trials in a straight runway reinforced with food. In the first and last phases of the training, all trials were reinforced, but in the middle phase, either 100% (Group 1), 50% (Group 2), or 0% (Group 3) of 30 trials were reinforced. The running speed in the extinction trials was fastest in Group 2 and slowest in Group 1. The largest difference in speed was found in the initial segment of the runway. Results indicate that the effect of partial reinforcement in the middle phase of training survived through the continuous reinforcement in the last phase of training. The effects of nonreward during training trials appear to be different from those during the extinction trials. (English summary) (17 ref)—S. Nakajima.

669. Baker, A. G. (U Sussex, Brighton, England) Conditioned inhibition is not the symmetrical opposite of conditioned excitation: A test of the Rescorla-Wagner model. *Learning & Motivation*, 1974(Aug), Vol 5(3), 369-379.—R. A. Rescorla and A. R. Wagner's 1972

linear associative model of learning predicts that a neutral stimulus will become weakly excitatory if it is paired with a conditioned inhibitor and the compound is not reinforced. If the inhibitor is not allowed to extinguish during these pairings, the model predicts that the neutral stimulus will become strongly excitatory. The present Exp I tested the latter prediction of a strong effect using 16 male hooded Long-Evans rats in a conditioned emotional response paradigm, and found no evidence that the pairings made the neutral stimulus excitatory. Exp II, with 24 rats, replicated Rescorla's 1972 finding of a weak excitatory effect, but showed that even on a relearning test the experimental group learned no faster than a novel-stimulus control group.—*Journal abstract*.

670. Bankart, C. Peter; Bankart, Brenda M. & Burkett, Michael. (Wabash Coll) Social factors in acquisition of bar pressing by rats. *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1051-1054.—Examined the effects of a response-sophisticated model on the acquisition of a novel operant response (barpressing) in 30 male Holtzman rats. Results are consistent with A. Bandura's (1969) social learning theory and suggest that previous studies may have confounded acquisition with performance in attempting to demonstrate observational learning in species other than humans.—*Journal abstract*.

671. Barlow, J. J. & Sanders, G. D. (University Coll, U London, England) Intertrial interval and passive avoidance learning in *Octopus vulgaris*. *Animal Learning & Behavior*, 1974(May), Vol 2(2), 86-88.—When 105 octopuses were trained on a passive avoidance task at various intertrial intervals from .05 to 10 min, acquisition rate was maximal at the intermediate intervals, a finding similar to those obtained with rats. Explanations involving fear are thought to be inadequate, and the phenomenon is interpreted in terms of short-term memory.

672. Beach, F. A. et al. (US Naval Undersea Ctr, Hawaii Lab, Kailua) Spatial habit reversal in two species of marine mammals. *Psychological Record*, 1974(Sum), Vol 24(3), 385-391.—Tested 2 male California sea lions and 1 female Atlantic bottlenose dolphin over 19 reversals of a spatial problem. Both species performed well on spatial reversal and reached asymptote quickly. Error rates varied more between the 2 sea lions than between the 2 species. Incidence of spontaneous reversal was positively correlated with lower error rates for each S. The tendency for spontaneous reversal on the earlier problems appears in conflict with notions proposing improvement of reversal performance as a function of decrement in retention produced by proactive interference.—*Journal abstract*.

673. Beck, Robert C. & Bidwell, Liane D. (Wake Forest U) Incentive properties of sucrose and saccharin under different deprivation conditions. *Learning & Motivation*, 1974(Aug), Vol 5(3), 328-335.—Reports results of 2 experiments with a total of 48 male albino Holtzman water-deprived, food-deprived, or nondeprived rats. In Exp I it was found that hungry Ss developed a 100% preference for 8% sucrose over water in a maze-choice situation, whereas thirsty Ss developed no preference. When deprivation conditions for the 2 groups were reversed, the pattern of preference relations also reversed. In Exp II nondeprived Ss developed a

preference for either 8% sucrose or .2% saccharin over water, while thirsty Ss did not develop a preference for either of these over water. Results are discussed in terms of incentive theory.—*Journal abstract.*

674. Behar, Isaac & LeBedda, John M. (US Army Aeromedical Research Lab, Fort Rucker, AL) **Effects of differential pretraining on learning-set formation in rhesus monkeys.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 277-283.—Compared the rate of learning-set formation by 4 rhesus monkeys that had previously been pretrained on the win-stay component of the learning-set strategy (Group WS) to the rate evidenced by 4 others that had pretraining on the lose-shift component (Group LS). Differences between groups were small, and asymptotic levels were below those previously obtained by monkeys without pretraining. The negative transfer resulted from generalized tendencies to perseverate or shift (Groups WS and LS, respectively), regardless of response outcome. The former tendency dissipated relatively rapidly, while the latter persisted very markedly throughout the 400-problem learning-set series. It is noted that learning-set formation requires a balance between the win-stay and lose-shift components; however, the optimal ratio is unknown. (19 ref)—*Journal abstract.*

675. Berger, Laurence H. & Kettlewell, Neil M. (U Montana) **The effect of cutaneous afferent activity on instrumental learning in rabbits.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 201-204.—Used 2 methods—an instrumental escape-avoidance paradigm and a yoked classical-conditioning paradigm—to train the nictitating membrane response in 24 New Zealand albino rabbits. The magnitude of cutaneous afferent activity (CAA) from the orbital region of the eye was controlled using mechanical and chemical means. Ss were trained with augmented and diminished CAA. Diminished levels of CAA depressed learning in both training paradigms. Instrumental Ss emitted more nictitating membrane responses than did the yoked classical controls under conditions of augmented CAA. It is concluded that the general importance of the role of CAA in learning was strengthened.—*Journal abstract.*

676. Bolles, Robert C.; Riley, Anthony L.; Cantor, Michael B. & Duncan, Perry M. (U Washington) **The rat's failure to anticipate regularly scheduled daily shock.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 365-372.—Gave 32 female Long-Evans rats in Exp I an electric shock at the same time each day, either at noon or at midnight, for 30 days to see if they would anticipate shock by making a learned escape response before a scheduled shock. In Exp II with 7 female Wistar rats, subcutaneous temperature was recorded before a regularly scheduled daily shock to see if there was anticipatory conditioned emotional reaction. Both experiments showed an absence of anticipation. It is suggested that diurnal anticipation may be limited in the rat to the hunger-feeding system.—*Journal abstract.*

677. Braud, William G. & Ginsburg, Harvey J. (U Houston) **Immobility reactions in domestic fowl (*Gallus gallus*) less than 7 days old: Resolution of a paradox.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 104-108.—Found that 12 domestic white Leghorn chickens showed virtually no immobility reactions until the age of

9 days when tested repeatedly on a flat surface. 12 other chicks showed pronounced immobility reactions as early as 1 day of age when tested repeatedly on a cloth surface which slightly contoured the chick's body. It is suggested that previous failures to observe immobility reactions in chicks less than 7 days old were due to inappropriate testing conditions and not to the absence of fear, insufficient hormonal functioning, or nonfunctioning "releasing nervous mechanisms." Young chicks do indeed become immobile if effector disruption is prevented and/or if increased physical contact during induction augments fear or produces a "prolonged zero" in the animal's defensive distance. (19 ref)—*Journal abstract.*

678. Brodigan, David L. & Trapold, Milton A. (U Minnesota) **Recovery from conditioned suppression to a partially overlapping compound stimulus.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 89-91.—In a conditioned suppression paradigm with 8 male albino rats, a partially overlapping compound stimulus—consisting of 3 min of continuous illumination of the houselight with 3 discrete 5-sec presentations of a tone superimposed—signaled occurrences of electric shock. A .5-sec electric shock was coterminous with each tone presentation. Ss that received this treatment in early conditioning sessions showed considerable recovery from conditioned suppression to the houselight as the experiment progressed. The effect was not reversible, and it could not be demonstrated in Ss that experienced extensive prior conditioning to the houselight alone. Results are discussed in relation to a hypothesis concerning the modulation of behavioral control exerted by elements of compound stimuli and as they relate to a recent theoretical model for Pavlovian fear conditioning.—*Journal abstract.*

679. Burns, Richard A.; Woodard, William T.; Henderson T. B. & Bitterman, M. E. (U South Florida) **Simultaneous contrast in the goldfish.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 97-100.—Conducted an experiment in which 11 goldfish trained with small reward for response to one color and large reward for response to another color performed less well for the small reward than 10 controls trained with small reward for response to both colors. Results (with liquid food as reward) cannot be explained in terms of postingestive inhibition (evidence from prior experiments with *Tubifex* worms as reward being inconsistent on this point) or in terms of within-sessions decrement in drive. Findings bear on the phyletic generality of simultaneous contrast and on the relation of simultaneous to successive contrast, a phenomenon that has thus far failed to appear in goldfish. (17 ref)—*Journal abstract.*

680. Campbell, Byron A.; Misanim, James R.; White, Brent C. & Lytle, Loy D. (Princeton U) **Species differences in ontogeny of memory: Indirect support for neural maturation as a determinant of forgetting.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 193-202.—Studied the development of long-term memory in 150 Sprague-Dawley rats and 80 male Hartley guinea pigs as a function of age, using active escape and passive avoidance tasks. Memory increased with age in the rats but did not change in the guinea pigs. It is concluded that neurological

maturity at the time of original learning appears to be a major determinant of long-term memory. (25 ref) —*Journal abstract.*

681. Capaldi, E. J. & Freese, M. R. (Purdue U) **Partial reward training level and reward magnitude: Effects on acquisition and extinction.** *Learning & Motivation*, 1974(Aug), Vol 5(3), 299-310.—2 groups of 10 male albino Holtzman rats each received either a large magnitude (.90 g) or a small magnitude (.18 g) of partial reward (PR) and 7 successive acquisition-extinction sessions in the runway. The large-magnitude PR group ran much faster than the small-magnitude PR group in the early acquisition sessions, with differences between the groups declining over sessions. In the early extinction sessions, the large-magnitude PR group showed greater resistance to extinction than the small-magnitude PR group, but in the late extinction sessions this relation was reversed. Resistance to extinction decreased over sessions, this decrease being greater under a large than under a small magnitude of PR. (20 ref)—*Journal abstract.*

682. Carlson, Kristin R. & Eibergen, Robert . (U Pittsburgh, Medical School) **Factors influencing the acquisition of tactual random figure discriminations by rhesus monkeys.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 133-137.—Trained 4 mature male rhesus monkeys to perform 2-object random figure discrimination problems by touch, and compared their performance to the visual acquisition of the same problems (reported earlier). In both modalities, choice latencies were shorter to the correct than to the incorrect figure. Tactual learning, however, required significantly more trials to criterion, was independent of stimulus figure complexity, and was characterized by significantly shorter choice latencies. Rotation of the figures 180 deg after criterion performance was achieved yielded partial recognition of the figures visually, but no recognition tactually. Results are explained by different observational or cue-utilization strategies. The majority of the figure is inspected visually, but only the same small section of the perimeter is used tactually. Thus, restricted use of the available cues characterizes tactual performance and is responsible for generating differences in various measures of learning between vision and touch in the monkey. (19 ref)—*Journal abstract.*

683. Carmona, Alfredo; Miller, Neal E. & Demierre, Terrie . (U Costa Rica, San Jose) **Instrumental learning of gastric vascular tonicity responses.** *Psychosomatic Medicine*, 1974(Mar), Vol 36(2), 156-163.—Trained 10 Sprague-Dawley male albino rats with a chronically implanted device that allowed photoelectric plethysmographic measures to be made of the stomach wall while paralyzed with dextrotubocurarine and being artificially respirated. One group was reinforced by avoidance of and/or escape from electric shocks to the tail, whenever increases in the transmission of light through the stomach wall occurred during a CS; another group was reinforced for decreases. Reliable changes in the rewarded direction were learned. Results are interpreted as evidence for the instrumental learning of a gastric response which, in the light of control experiments, very probably was a vasomotor one producing changes in the

amount of blood in the stomach wall. (17 ref)—*Journal abstract.*

684. Caul, William F.; Barrett, Robert J.; Thune, Gene E. & Osborne, Guy L. (Vanderbilt U) **Avoidance decrement as a function of training-test interval: Single cycle or multiphasic?** *Behavioral Biology*, 1974(Jul), Vol 11(3), 409-413.—Assessed the Y-maze avoidance performance in independent groups of male Fisher-derived F344 strain rats ( $N = 63$ ) during a 50-trial test session which followed a 30-trial training session by 15 min, 1, 6, 12, 18, 24, or 30 hrs. While a decrement in avoidance performance was present at the 1-hr interval, there was no evidence for a difference among the other groups. The number of correct discriminations was unaffected by training-test interval.—*Journal abstract.*

685. Chase, Sheila; Geller, Ethel A. & Hendry, Jean S. (Hunter Coll., City U. New York) **On the establishment of a continuous repertoire.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 14-16.—2 pigeons trained to peck the response key directly below a spot of light which appeared in only 3 of 5 positions were tested with the spot in all 5 positions. Key choice, given these test stimuli, showed a mixture of functional control: on some trials, the key beneath the spot was chosen, indicating that the training produced a correspondence between novel points on the stimulus and response dimensions (a continuous repertoire). On other trials, the specific responses acquired during training were made.—*Journal abstract.*

686. Cone, Donna M. (Lynchburg Coll) **Do mammals lick at a constant rate? A critical review of the literature.** *Psychological Record*, 1974(Sum), Vol 24(3), 353-364.—A review of research on uninterrupted licking in mammals indicates that studies which support the invariant-rate hypothesis do not contain statistical analyses. When parametric analyses are used, several variables, including sex, age, deprivation level, time of day, and phase of the test session, are associated with statistically significant burst-lick-rate variability. Possible reasons for the general failure to regard lick-rate invariance as a testable null hypothesis are discussed. (33 ref)—*Journal abstract.*

687. Day, Richard B. & Platt, John R. (McMaster U, Hamilton, Ontario, Canada) **Stimulus control of foodcup approach following fixed ratio reinforcement.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 148-152.—Trained 52 female hooded rats on fixed-ratio (FR) schedules requiring either 5 or 10 leverpresses to produce reinforcement and an intertrial interval (ITI). Half of the Ss at each ratio requirement were extinguished on an FR 5 and half on an FR 10 schedule of ITI presentation. Fewer foodcup approaches were made on the FR 10 than on the FR 5 extinction schedule, regardless of acquisition FR. Leverpresses per approach were fewer on the FR 5 than on the FR 10 extinction schedule and were fewer following FR 5 than following FR 10 acquisition. Data suggest the existence of interoceptive as well as exteroceptive stimulus control of foodcup approach and are discussed in terms of their implications for a response-unit account of extinction.—*Journal abstract.*

688. Dickson, Andrew L. . (U Southern Mississippi) **Temporal course of open-field behavior in albino rats.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 447-452.

—Measured the locomotor activity and defecation of 72 male albino Wistar rats, at 24-hr intervals on 6 consecutive days under 6 schedules of exposure in an open field. Results indicate that the schedule of exposure was an important determiner of locomotor activity and defecation. (27 ref)—*Journal abstract*.

689. Eiserer, Leonard A. & Hoffman, Howard S. (Bryn Mawr Coll) **Imprinting of ducklings to a second stimulus when a previously imprinted stimulus is occasionally presented.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 123-125.—10 newly hatched Khaki Campbell ducklings were imprinted to 1 stimulus and then given prolonged visual exposure to a 2nd discriminable stimulus. Filial behavior toward the 2nd stimulus developed more slowly when the original imprinting stimulus was occasionally presented during exposure to the 2nd stimulus than when the original stimulus was withheld during such exposure. Results are interpreted in terms of a possible motivational aftereffect following presentations of the original imprinting stimulus.—*Journal abstract*.

690. Elias, Merrill F. & Schlager, Gunther. (Syracuse U) **Discrimination learning in mice genetically selected for high and low blood pressure: Initial findings and methodological implications.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 261-267.—Mice bred from an 8-way cross of 8 inbred strains were selected for high or low blood pressure and compared with randomly mated controls on discrimination learning performance. The high blood pressure Ss performed more poorly than the low blood pressure Ss. Subsequent comparisons of high blood pressure Ss from a different foundation stock and extreme blood pressure groups from an F<sub>2</sub> distribution, formed from the cross of F<sub>1</sub> (High × Low) hybrids, indicated that these differences were not due to a causal relationship between blood pressure and performance, linked gene effects, or pleiotropic effects of the same genes. Implications of these findings for the development of animal models for hypertension and behavior studies are discussed. (37 ref)—*Journal abstract*.

691. Elkins, Ralph L. (VA Hosp, Augusta, GA) **Conditioned flavor aversions to familiar tap water in rats: An adjustment with implications for aversion therapy treatment of alcoholism and obesity.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 411-417.—Notes that conditioned flavor aversions, readily established in rats by pairing a novel palatable flavor with radiation-induced or drug-induced illness, are highly efficient adjustments with implications for the treatment of alcoholism and obesity. Recent experiments show that such aversion acquisition is diminished by preconditioning familiarity with the conditioned stimulus (CS) flavor. However, these studies involved single pairings of the target flavor with postingestional illness. In the present experiment with Sprague-Dawley-derived male rats, multiple conditioning trials and discrimination training were combined to produce a marked aversion to a highly familiar and relatively bland substance, plain tap water. This conditioned water aversion demonstrates the transient nature of the CS familiarity effect, thus weakening any contention that preconditioning exposure to target flavors will necessarily render aversion therapy

for alcoholism or obesity ineffective. (39 ref)—*Journal abstract*.

692. Franchina, Joseph J.; Agee, Carol M. & Hauser, Peter J. (Virginia Polytechnic Inst & State U) **Response prevention and extinction of escape behavior: Duration, frequency, similarity, and retraining variables in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 354-363.—Describes 3 experiments in which a total of 158 female hooded rats received escape training, response prevention, and then regular extinction. Following training, Ss in Exp I received 1 response-prevention trial lasting 0, 120, 240, or 400 sec, or multiple trials (6, 12, or 20) lasting 20 sec each. Extinction was faster as prevention duration or frequency increased. At each duration, extinction was faster following multiple- than following single-prevention trials. In Exp II Ss received "prevention" in the original escape situation or in similar or dissimilar situations. Extinction was faster as prevention and training situations increased in similarity. To evaluate the persistence of prevention effects, in Exp III Ss received shock retraining between prevention and regular extinction. Retraining attenuated but did not eradicate the effects of prevention. (19 ref)—*Journal abstract*.

693. Frontali, Marina & Bignami, Giorgio. (Inst of National Council of Research, Rome, Italy) **Stimulus nonequivalences in go/no-go avoidance discriminations: Sensory, drive, and response factors.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 153-160.—Previous work with rats showed slower active avoidance (AA) and passive avoidance (PA) learning in a light-go-noise-light no-go task (L<sup>+</sup> NL<sup>-</sup>) than in a noise-go-light-noise no-go task (N<sup>+</sup> LN<sup>-</sup>) independently of noise intensity and of presence or absence of AA pretraining. Exp I with 64 male Wistar albino rats compared these 2 tasks and the corresponding discriminations with a compound AA and a simple PA signal. The latter were learned at a faster rate, with only negligible differences between the 2 types of stimulus arrangements. Exp II (n = 72) investigated the acquisition and reversal of 4 go-no-go tasks with a simple AA signal, with either a simple or a compound no-go signal and asymmetrical reinforcement. Groups with a simple no-go signal acquired AA with little or no generalization to the other stimulus. In reversal, however, the L<sup>+</sup> N<sup>-</sup> group responded to the no-go signal much more frequently than the other. Both the L<sup>+</sup> NL<sup>-</sup> and the N<sup>+</sup> LN<sup>-</sup> groups gave a large number of responses to the extinction signal, but the differences between the 2 groups were at least as large as in previous work with a PA contingency. Data show that perceptual or attentional phenomena cannot explain stimulus nonequivalences in situations with a compound no-go signal. Furthermore, the similar nonequivalences found in situations with and without differential fear conditioning lead to complex, highly speculative models concerning possible interactions between response and drive-modulating properties of various stimuli. (24 ref)—*Journal abstract*.

694. Garzanit, Frank S. & Richardson, Ann M. (California State U, Los Angeles) **Black-white discrimination and orienting behavior in the desert iguana (*Dipsosaurus dorsalis*).** *Animal Learning & Behavior*,

1974(May), Vol 2(2), 126-128.—Trained 6 desert iguanas on a black-white discrimination problem using a modified Lashley maze I. Results, in terms of number of trials to criterion, compare favorably to those reported for turtles on the same brightness difference. Efficiency of learning was attributed to (a) the angle separating the discriminanda, (b) intertrial substrate temperature, and (c) visual attentional characteristics of the apparatus. Orienting responses varied in expected directions according to speed of learning and difficulty of maze choice points. (19 ref)—*Journal abstract*.

695. Goldstein, Melvin L. (Indiana U, Komomo) **Effect of static background cues on classical fear conditioning.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 145-151.—Varied the duration of exposure of male albino Holtzman rats to background-apparatus cues at 2 levels during classical fear conditioning. Group 1 spent the entire intertrial interval between successive conditioned stimulus-unconditioned stimulus (CS-UCS) E presentations in the shock compartment of a conditioning box. Group 2 was placed into a neutral carrying cage during the intertrial intervals. A hurdle-jump response was used as an indicator of the magnitude of conditioned fear. Group 2 performed more poorly on the test response than Group 1. Results are interpreted in terms of differential conditioning to the components of a compound CS. The background-apparatus cues were identified as 1 component of the compound CS.—*Journal abstract*.

696. Hancock, Robert A. & Ayres, John J. (Kansas State U) **Within-subject effects of sucrose concentration on conditioned suppression of licking.** *Psychological Record*, 1974(Sum), Vol 24(3), 325-331.—Measured dipper licking in 10 male Charles River albino rats tested 18 times under each of 2 sucrose conditions. Conventional indices of preference showed that every S strongly preferred 32% over 8% sucrose, yet only 5 Ss suppressed significantly more to a preaversive conditioned stimulus when licking the less preferred solution. 4 Ss did not suppress differentially as a function of sucrose concentration, and 1 suppressed significantly more when licking 32% than when licking 8%.—*Journal abstract*.

697. Heacock, Del; Smith, Nathan & Thurber, Steven. (Boise State Coll) **A multidimensional analysis of variables related to bar-pressing in the presence of free food.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 105-108.—Made a comparison between schedules of reinforcement—continuous reinforcement (CRF) and fixed ratio (FR-5 and FR-10)—and various levels of deprivation (0, 24, 48, and 72 hrs) in the presence of food. 24 male Sprague-Dawley albino rats were randomly assigned to each of the conditions and trained to barpress on a CRF schedule. The only significant effect ( $p < .05$ ) was found between the CRF and FR-10 schedule. Results contradict previous studies which found high rates of barpressing in the presence of free food.—*Journal abstract*.

698. Hershkowitz, Moshe & Samuel, David. (Weizmann Inst. of Science, Rehovot, Israel) **The retention of learning during metamorphosis of the crested newt (*Triturus cristatus*).** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 83-85.—Housed 5 crested-newt larvae in individual cages. Ss were given training based on the characteris-

tic "snapping response" of both larvae and adult newts to any dark, small objects. It was found that larvae could be taught a simple discrimination task for food reward. The preference established by training was retained by the adult newts after metamorphosis. No significant change in the natural preference of these animals occurred after metamorphosis. Adult animals appear to be more difficult to train than the larvae.—*Journal abstract*.

699. Hillman, Nancy M.; Fuseller, Penelope H. & Riopelle, Arthur J. (Louisiana State U, Baton Rouge) **Protein deprivation in primates: II. Effects of fondling on feeding behavior of discomforted infant rhesus monkeys.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 369-374.—19 infant rhesus monkeys whose mothers were fed diets providing 1, 2, or 4 g protein/kg body weight/day during pregnancy were fondled for 5 min before their noon and 4 PM feedings on 2-3 days/wk. 14 were caressed between 10 and 30 days of age, and 18 were caressed between 41 and 95 days of age. The intake at meals following handling was compared to that for meals when handling was not given. The younger Ss' intake was specific to the diet group and treatment. The older Ss ate more at the 4 PM meal than at the noon meal and more at weekday, nonhandled feedings than at weekday, handled, or weekend feedings. Differences due to maternal nutritional history were not significant. Infant Ss subjected to a variety of laboratory anxiety-producing tests during weekdays drank more formula on test days than on tranquil weekends. This effect was ameliorated by preprandial comforting.—*Journal abstract*.

700. Hogan, Jerry A. (U Toronto, Ontario, Canada) **On the choice between eating and aggressive display in the Siamese fighting fish (*Beta splendens*).** *Learning & Motivation*, 1974(Aug), Vol 5(3), 273-287.—Reports results of 2 experiments with a total of 44 male Siamese fighting fish. In Exp I Ss were given a choice between food and a mirror image in a T maze. All Ss consistently preferred food. In Exp II the choice of Ss that lived in the T maze for the duration of the experiment was compared with the choice of Ss that were transferred to the T maze for each experimental session. Ss that lived in the T maze consistently preferred food, but Ss that were transferred showed a shift in preference toward mirror image. Differential inhibition of hunger and aggression by fear is suggested as the cause of the preference shift. (17 ref)—*Journal abstract*.

701. Israel, Allen C.; Devine, Vernon T.; O'Dea, Margaret A. & Hamdi, Mark E. (State U. New York, Albany) **Effect of delayed conditioned stimulus termination on extinction of an avoidance response following different termination conditions during acquisition.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 360-362.—Investigated the role of delayed conditioned stimulus (CS) termination in the extinction of a shuttle-box avoidance by exposing 28 male Long-Evans rats to conditions of delayed or nondelayed CS termination. Ss were assigned to 1 of 4 conditions of CS termination: (a) delay during acquisition-delay during extinction, (b) delay-no delay, (c) no delay-delay, or (d) no delay-no delay. Delayed CS termination during acquisition resulted in poorer performance on all

measures of acquisition. Delayed CS termination during extinction resulted in fewer avoidances regardless of acquisition condition. Results are discussed in terms of competing explanations of effects of CS delay.—*Journal abstract.*

702. Katzev, Richard D. & Berman, Jeffrey S. (Reed Coll) **Effect of exposure to conditioned stimulus and control of its termination in the extinction of avoidance behavior.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 347-353.—Describes 2 experiments in which, following signaled shuttle box avoidance training, a total of 52 female Fischer<sub>344</sub> rats were exposed to the conditioned stimulus (CS) during no-shock treatment trials and subsequently tested during extinction trials in which shock was also absent. In Exp I, Ss that could control the termination of the CS during treatment responded significantly more often during extinction than yoked partners that received the same pattern and duration of CS exposure but could not control its termination. Exp II revealed that the probability of responding during extinction was a decreasing function of the duration of CS exposure during treatment. Thus, in the absence of shock, both lack of control over CS termination and increasing CS exposure each independently facilitated the weakening of well-established avoidance responses. (21 ref)—*Journal abstract.*

703. Kello, John E. & Staddon, J. E. (Duke U.) **Control of long-interval performance on mixed cyclic-interval schedules.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 1-4.—Exposed 4 adult male White Carneaux pigeons to a series of cyclic-interval food reinforcement schedules in which each cycle comprised 12 1-min intervals followed by 2 2-min intervals, 2 6-min intervals, or 6 6-min intervals. Response rate was higher and postfood pause shorter in the long (2- or 6-min) than in the short (1-min) intervals. Response rate decreased and pause generally increased across successive 2-min intervals, but response rate increased and pause generally decreased across successive 6-min intervals. Performance in the 2-min intervals is consistent with a temporal discrimination account, but performance in the 6-min intervals supports earlier suggestions that some other factor (response "momentum") may be involved when the long intervals are sufficiently longer than the short.—*Journal abstract.*

704. Kimura, Hiroshi . (Waseda U, Tokyo, Japan) **[Latent extinction of a partially reinforced response in the white rat.]** (Jpn) *Annual of Animal Psychology*, 1971(Mar), Vol 21(2), 81-90.—Confirmed the facilitating effect of latent extinction on a partially reinforced response. 71 male white rats learned to approach food in a straight runway with either 100, 75, 50, or 25% of the trials reinforced. Direct placing of the Ss into the goal box without reinforcement reduced the running speed in later extinction trials in the 100% group, but increased speed in the 50% group. The 75% and 25% groups were not different from control Ss, which were placed into a neutral box. Results agree with the findings of previous workers. (English summary)—S. Nakajima.

705. Klare, Warren F. (Syracuse U) **Conditioned fear and postshock emotionality in vicious circle behavior of rats.** *Journal of Comparative & Physiological Psychology*,

1974(Aug), Vol 87(2), 364-372.—Gave 64 female hooded Long-Evans rats 15 shock-escape trials in a runway (1 trial/day), followed by 30 extinction trials. Half of the Ss received regular extinction treatment, while the others received a punishing shock if they ran. The Ss' level of activity (or freezing) before the trial was used as an index of conditioned fear. In acquisition, these shocked Ss were less active before the trial than 56 additional Ss receiving identical treatment, but without shock. During extinction, punished Ss both ran longer and showed less pretrial activity. This directly supports the vicious circle hypothesis that punishment for running maintains the fear motivating the running. When postshock emotionality was induced before a trial, it tended to suppress vicious circle behavior.—*Journal abstract.*

706. Kullig, Beverly M.; Bryant, Rodney C.; Petty, Frederick & Byrne, William . (U Tennessee, Medical Units, Brain Research Inst, Memphis) **Preliminary studies on acquisition of a discriminated depth-position task by goldfish.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 403-408.—Describes a new technique for the study of discriminated avoidance in the goldfish. 46 goldfish were trained in 1 of 2 conditions: to avoid electric shock by swimming to the top of the tank in the presence of a red light and to the bottom of the tank during a green light stimulus (Red up—Green down), or the reverse condition, to avoid shock by swimming up on green and down on red (Green up—Red down). Results indicate that learning occurred whether trials were spaced or massed and that the technique can be used for acquisition training of individual fish or fish trained in groups. Differences in rate of learning between fish trained in the Red up—Green down condition and fish in the Green up—Red down condition were also found. The superior performance of the Red up—Green down group is discussed in terms of the spectral characteristics of goldfish vision and the nature of the task.—*Journal abstract.*

707. MacDonald, Glenn E. & de Toledo, Leyla . (U Toronto, Ontario, Canada) **Partial reinforcement effects and type of reward.** *Learning & Motivation*, 1974(Aug), Vol 5(3), 288-298.—Describes 2 experiments in which a total of 36 albino and 32 hooded Blue Spruce male rats were trained to barpress or to run down a straight runway for food or for water under conditions of either continuous or partial reinforcement. In both experiments, there was greater persistence of behavior which had been reinforced with food than with water. In Exp II the partial reinforcement extinction effect was observed with food reward but not with water. Within the context of the experimental procedures used, it is concluded that the rat has mechanisms for developing persistence which are dependent on the specific motivational system involved. This conclusion is related to theories of partial reinforcement effects and to possible biological origins of the mechanisms.—*Journal abstract.*

708. Mackintosh, N. J. (U Sussex, Brighton, England) **A search for contrast effects in discrete-trial discrimination learning by pigeons.** *Learning & Motivation*, 1974(Aug), Vol 5(3), 311-327.—Behavioral contrast has often been observed in free-operant experiments with pigeons, but rarely in discrete-trial experiments with rats. Although H. M. Jenkins (see PA, Vol 36:1EJ11J) and H.

S. Terrace (1963) have reported a discrete-trial contrast effect in pigeons, the present 5 experiments with a total of 42 White Carneaux pigeons found no evidence that latency of responding to the positive stimulus (S+) in a discrete-trial situation was reliably decreased by alternating reinforced trials to S+ with nonreinforced trials to the negative stimulus (S-). Latency of responding to S+ was affected neither by the length of the preceding intertrial interval (within the range of 10-60 sec), nor by whether the preceding trial had been to S+ or to S-. Results suggest that the appearance of positive contrast in Jenkins's experiment was a consequence of differences in the variability of the intertrial interval experienced by control and discrimination groups. In 2 of the experiments employing standard free-operant procedures, contrast was observed as an increase in rate of responding to S+, but not as a decrease in latency of the 1st response on each S+ trial. The implication is that contrast effects are more readily observed with the rate measures of free-operant experiments than with the latency measures of discrete-trial experiments. (22 ref)—*Journal abstract*.

709. Manning, Frederick J.; Jackson, Mason C. & McDonough, John H. (Walter Reed Army Inst. of Research, Washington, D.C.) **A simple method of improving leverpress avoidance by rats.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 5-8.—In 3 experiments, a total of 22 Long-Evans hooded and 6 Wistar albino male rats were trained to avoid electric shock in a free-operant leverpress procedure. After stable performance was obtained, sessions were suspended for periods of 1 to 4 wks. In 24 Ss, shock rates were lower, some by as much as 75%, when avoidance sessions were resumed. This improvement extended throughout the entire 60-100-min session and occurred despite variations in apparatus, strain of rat, length or efficacy of prevacation training, lesions in the amygdala, and unshocked exposure to the apparatus during vacation.—*Journal abstract*.

710. Masur, Jandira . (Paulista School of Medicine, São Paulo, Brazil) [The "open field" method as a measure of emotional reactivity of rats.] (Port) *Revista de Psicologia Normal e Patológica*, 1970(Jul), Vol 16(3-4), 195-220.—Reviews the open-field technique from its earliest studies, concentrating of defecation ambulation, grooming, and rearing. On the basis of the research cited, it is concluded that: (a) Strain, age, and sex are important variables. (b) Early experiences are a determinant of behavior in an open field. (c) Direction of behavior alteration induced by different manipulations cannot be predicted. (English summary) (76 ref)—N. T. Pinckney.

711. Matsuda, Michihiko . (Chiba U, Faculty of Education, Japan) [Avoidance behavior for food and compartment conditioned by midbrain central grey stimulation in cats.] (Japn) *Annual of Animal Psychology*, 1971(Mar), Vol 21(2), 69-80.—Studied conditioned avoidance responses using electrical brain stimulation as the unconditioned stimulus. 6 adult cats received stimulation of the ventral part of the mesencephalic central gray area (a) when they approached milk, and (b) when they entered one compartment of a shuttle box. The stimulation intensity was at the threshold of escape,

and was well below the level that produced any sign of pain. All of the 4 Ss that drank the milk acquired passive avoidance response, and 3 out of 6 Ss learned conditioned avoidance of a compartment. Results suggest that the stimulation is negatively reinforcing by producing an aversive motivation, but not by exciting pain fibers. (English summary) (21 ref)—S. Nakajima.

712. Medin, Douglas L. (Rockefeller U., New York, N.Y.) **Position distinctiveness and successive discrimination learning.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 35-36.—Tested the prediction that increased spatial separation of discriminanda would facilitate successive discrimination learning. 8 pigtailed monkeys were trained concurrently on 2 successive discrimination problems, one with a small and the other with a large separation of cues. Better performance was associated with the larger cue separation.—*Journal abstract*.

713. Miller, H. L. & Loveland, Donald H. (Harvard U) **Matching when the number of response alternatives is large.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 106-110.—4 male White Carneaux pigeons could choose between 5 concurrently available response keys, each associated with a different variable-interval schedule of reinforcement. A 2-sec changeover delay was also in effect on each key. In almost all cases, the relative number of responses to a key and the relative time spent at it were nearly equivalent to the relative number of reinforcements it produced. In addition, matching was observed between the relative number of reinforcements at a key and the relative number of changeovers to it.—*Journal abstract*.

714. Mitani, Keiichi; Ando, Masafumi & Nagata, Hiroshi . (Okayama U, Japan) [An enhancement of general activity through a particular learning experience in the white rat.] (Japn) *Annual of Animal Psychology*, 1972(Nov), Vol 22(1), 21-27.—Studied the effect of a learning experience on the level of general activity. Male albino rats 450 days old were handled for 5 days and divided into 2 groups of 9 each. One group received 30 trials of food-reinforced runway training for 12 days, while the other group remained untouched. The trained group showed a higher level of activity in an activity wheel, suggesting that learning experience enhances general activity. (English summary)—S. Nakajima.

715. Montecchi, W. A.; Gallup, G. G. & Dunlap, W. P. (Rutgers U., Inst. of Animal Behavior, Newark) **The peep vocalization in group reared chicks (Gallus domesticus): Its relation to fear.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 116-123.—Conducted 4 experiments to determine the relation of fear and arousal to peeping in 165 socially-reared Production Red chicks. Pretest exposure to loud noise or shock resulted in decreased peeping in Ss tested in isolation, while in the presence of a mirror pretest exposure to loud noise reduced peeping, but pretest shock had no effect. Neither tranquilizer (Pacitran) ingestion or E proximity had any significant influence on peeping. An inverse relationship between peeping and activity latency was also revealed; peeping usually preceded the initiation of activity. (52 ref)—*Journal abstract*.

716. Morgan, M. J. (U Cambridge, England) **Do rats like to work for their food?** *Learning & Motivation*, 1974(Aug), Vol 5(3), 352-368.—Reports results of 5 experiments with a total of 29 female and 14 male hooded rats. Ss were given a choice in a 2-compartment box between response-dependent and response-independent schedules of food presentation. In general, the response-independent schedule was preferred, but the preference was not exclusive and considerable amounts of time were spent on the "work" (response-dependent) side. Food deprivation caused an increased preference for the response-independent schedule when the schedules were fixed, but not when they were variable. Addition of a signal to the work side, indicating the availability of reinforcement, increased preference for that side. Relative numbers of reinforcements obtained on the response-independent side exceeded the relative time spent there; when the relative reinforcements were equated by adding delays to the response-independent side, indifference between the schedules resulted. Latencies of food collection were higher on the response-independent side than on the lever side, and it is suggested that this gives a clue to the factors maintaining "work" in this situation.—*Journal abstract*.
717. Mountjoy, Paul T. (Western Michigan U) **Some early attempts to modify penile erection in horse and human: An historical analysis.** *Psychological Record*, 1974(Sum), Vol 24(3), 291-308.—Notes that between the years 1856 and 1919, Letters Patent were granted by the US Patent Office for 49 antimasturbatory devices; 35 were designed for application to the horse, while 14 were intended for man. After analysis of the surprisingly modern aversive-stimulation principles involved, an attempt is made to relate the onset and cessation of patenting activities to more general cultural variables in Euro-American society. (30 ref)
718. Okano, Tsuneya. (Shizuoka U, Japan) **A preliminary observation of orangutans in the rehabilitation station in Sepilok, Sabah.** *Annual of Animal Psychology*, 1971(Mar), Vol 21(2), 55-67.—Reports on a visit to an orangutan colony in Malaysia. To rehabilitate accidentally or illegally captured apes before returning them to their natural environment, 9 Ss were regularly fed at an unfenced station on the fringe of a jungle. Ss had freedom to leave the station for the jungle and to return to the station at any time. Unlike chimpanzees, orangutans were slow in movement, and did not display fighting or mutual grooming. An adult female and the youngest male formed a close relationship. 3-4 yr old males formed a play group, while 5-8 yr old males and females formed another group without playing. Adults remained in solitude.—S. Nakajima.
719. Olsen, Christopher A.; Delius, Juan D. & Hockey, Robert J. (U Newcastle, England) **Brain temperature alterations and the retention of visual pattern discriminations in pigeons.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 257-260.—Trained 4 racing pigeons in visual discriminations. Immediately after Ss had reached criterion their forebrain was either left untreated, heated, or cooled for 30 min, with water flowing through a chronically implanted cannula system. The effects of the treatments on retention were assessed in retraining sessions. Both brain temperature alterations led to slight saving scores and marked, significant response latency advantages, compared with the control treatment. (15 ref)—*Journal abstract*.
720. Ostroot, David & Mendelson, Joseph. (U Kansas) **Airlicking vs. water drinking in a T-maze: Thirsty rats prefer water.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 195-199.—Conducted an experiment to determine the duration of airlicking which is equivalent in reward value to 10 sec of drinking. 6 male, water-deprived hooded rats were trained to lick an airstream from a standard drinking tube. Ss were then tested in a T maze in which they were confronted with a choice between 10 sec of water and access to an airstream for periods of airlicking varying from 40 to 300 sec. All Ss preferred the water to the airstream, regardless of the duration of airlicking reward and irrespective of the goal positions in the maze. It is concluded that for a thirsty rat the rewarding effects of drinking water are very much greater than those of airlicking.—*Journal abstract*.
721. Petri, Herbert L. (Johns Hopkins U) **Discrimination of schedules that predict reinforcement from non-predictive ones and preference for less predictive schedules by rats.** *Learning & Motivation*, 1974(Aug), Vol 5(3), 336-351.—Examined the behavior of a total of 42 female Sprague-Dawley rats on schedules that either did or did not contain information about impending reinforcement in 2 experiments. Results of Exp I indicate that Ss discriminated between schedules of reinforcement that differed only in the amount of information they contained about impending reinforcement. Exp II revealed a preference for the schedule containing less information about impending reinforcement. Results suggest that predictable nonreinforcement is an important determiner of behavior in choice situations. (19 ref)—*Journal abstract*.
722. Pilley, John W.; Jones, Millard; Parker, Roy & Lyles, James. (Wofford Coll) **Spontaneous recovery as a function of drive and interval for recovery.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2)), 1343-1346.—Gave 54 male albino Holtzman rats 5 training trials/day for 12 days in a straight runway. Following 30 massed extinction trials, Ss were randomly assigned to 1 of 4 spontaneous-recovery groups. The groups received 5 additional extinction trials after intervals of either 5 min or 24 hrs under either low or high drive. High-drive Ss were run under a 23-hr water-deprivation schedule, while low-drive Ss received access to water for 5 min prior to recovery trials. Results show that while high-drive Ss exhibited significantly greater recovery than low-drive Ss at the long recovery-interval, drive did not exert differential effects at the short interval for recovery.—*Journal abstract*.
723. Pinel, John P. & Mucha, R. F. (U British Columbia, Vancouver, Canada) **Role of footshock-produced activity and reactivity functions in the production of incubation and Kamin gradients.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 353-363.—120 male blackhooded rats received 10 noncontingent footshocks (FSs) in the start compartment of a 2-compartment box followed 1 min or 1, 4, or 24 hrs later by a test of 1-way active avoidance. 2 kinds of tests were employed, only one of which involved the administration of additional FSs. Ss

receiving no FS during the test were placed in the start compartment and their active-avoidance latencies were measured; the other Ss received FS during the course of 10 1-way active avoidance trials. In the no-FS condition, avoidance deteriorated monotonically over 24 hrs but in the FS condition the usual U-shaped Kamin effect was observed. Independent activity measures prior to each avoidance trial suggested that both of these functions resulted from FS-produced, time-related changes in activity or reactivity. When no FS was administered during the test, activity decreased monotonically over the 4 FS-test intervals; the reactivity to additional FSs administered during the test was a U-shaped function. Data clearly demonstrate the important role played by activity and reactivity functions in the production of the incubation and Kamin effects, respectively. (18 ref) —*Journal abstract.*

724. Pouthas, Viviane. (U Paris V—René Descartes, Lab of Experimental & Comparative Psychology, France) [Temporal regulation and the development of conditioning.] (Fren) *Année Psychologique*, 1974, Vol 74(1), 109-124.—Studied the acquisition of temporal regulation of behavior (a) during differential reinforcement of low rates (DRL) conditioning by naive rats and by rats pretrained with a fixed interval (FI) schedule, and (b) during FI conditioning by naive rats and by rats pretrained with a DRL schedule. Postreinforcement pauses, interresponse times, and reinforcement rates of the 2 groups of Ss did not differ at the end of DRL conditioning. In the pretrained Ss, the behavior adapted to FI was replaced by behavior adapted to DRL. In contrast, postreinforcement pauses and reinforcement rates of pretrained Ss were higher than those of naive rats at the end of FI conditioning. 2 patterns of behavior elicited by the 2 experimental conditions have thus been observed during FI conditioning. However, 2 types of collateral behavior may have played a different role in adaptation to the 2 schedules; i.e., it is suggested that behavior which occurred in the food-cup area, and only during postreinforcement pauses, had a mediating role; behavior which occurred opposite the food-cup area, and only during DRL, had a role of inhibition compensation. —G. Rubin-Rabson.

725. Powell, Robert W. (U South Florida) Some measures of feeding behavior in captive common crows. *Auk*, 1974(Jul), Vol 91(3), 571-574.—Crows trained to keypeck under a continuous-reinforcement schedule in standard operant conditioning apparatus preferred live mealworms, but dog food and mynah bird pellets were effective when the Ss were food-deprived. Individual differences in food preferences were noted, suggesting that some diversity occurs in this type of crow behavior.

726. Ramsauer, Sharan; Mendelson, Joseph & Freed, William J. (U Kansas) Effects of water temperature on the reward value and satiating capacity of water in water-deprived rats. *Behavioral Biology*, 1974(Jul), Vol 11(3), 381-393.—Hypothesized that, since orolingual cooling is a primary reward for water-deprived rats, cold water should be more rewarding than warm water. 4 male hooded rats were allowed to barpress for water at approximately 12° or 36°C. Testing started when their body weights had dropped to 80% of their predeprivation

levels and was continued as their weights were allowed to drift slowly upward. Mean number of barpresses for cold and body-temperature water were compared under the various body-weight conditions, and in almost all cases the Ss barpressed at a higher rate for cold water. When these same Ss were again deprived to 80% body weight in Exp II, they showed an overwhelming preference for cold over warm water in 10-min choice tests. Exp III with these Ss replicated G. Kapatos and R. M. Gold's finding (1972) that rats offered either only warm water or only cold water in different test sessions drink more warm water than cold. Results support the hypothesis, but it is suggested that the intake of cold water is terminated prematurely by the drop in body temperature which it produces.—*Journal abstract.*

727. Reynierse, James H. (Hope Coll.) Elitism among albino rats: Genius and overachievement. *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 33-34.—From a population of 234 adult albino Sasco rats that had been trained in a shuttlebox, the records of 40 Ss which had shown particularly excellent avoidance performance were identified and examined further. Contrary to the conventional view that shuttlebox avoidance takes many trials to acquire, it was demonstrated that many Ss learned the response quickly, showing maintained avoidance throughout a 200-trial session. Results are discussed in terms of particularly important procedures, notably the presence of odors associated with fear, which facilitate rapid acquisition of shuttlebox avoidance. —*Journal abstract.*

728. Reynierse, James H.; Klomp, Linda & Bach, Paul J. (Hope Coll) Effects of response prevention upon the "Kamin effect" in rats. *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 417-420.—Describes 2 experiments with a total of 96 female Sasco rats and 90 male albino rats. After Ss had incompletely learned a shuttle escape-avoidance task, response prevention procedures were introduced and Ss were retested on the avoidance task after 0, 1, or 24 hrs. Female controls, which did not receive response prevention, showed the U-shaped retention function characteristic of the "Kamin effect," while response prevention disrupted avoidance performance under every condition. Male Ss exhibited a much smaller effect with minimal recovery after 24 hrs. Results are discussed in terms of potential methodological and theoretical significance for the problem of residual fear.—*Journal abstract.*

729. Roberts, William A. & Grant, Douglas S. (U Western Ontario, London, Canada) Short-term memory in the pigeon with presentation time precisely controlled. *Learning & Motivation*, 1974(Aug), Vol 5(3), 393-408.—Studied delayed matching-to-sample in 3 experiments with 10 Silver King pigeons, using a procedure which precisely controlled the presentation time of the sample stimulus. Exp I and II revealed that (a) accuracy of matching increased as a negatively accelerated function of presentation time, (b) accuracy declined when an interstimulus interval was introduced between successive presentations of the sample stimulus, and (c) the rate at which accurate matching was restored after an interstimulus interval was greatest when the initial presentation of the sample was short and the interval was long. It is concluded that a theory of short-

term memory based on the growth and decay of trace strength could account adequately for all of these findings. Exp III studied trace interaction by presenting 2 sample stimuli first in succession and then simultaneously for choice. Predictions from trace competition theory about the specific lengths of presentation of these stimuli at which choice of the 2nd stimulus should be 50% or deviate systematically below 50% were not supported. It appears that a recency mechanism in addition to competition is necessary to explain trace interaction effects.—*Journal abstract.*

730. Rodewald, H. Keith. (Central Michigan U) **A conjoint-measurement analysis of control by dimensions of compound stimuli.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 551-556.—Trained 3 barnyard chickens on a go-no-go discrimination in which the positive stimulus was 3 white dots in a vertical array on a red background and the negative stimulus was 3 white dots in a horizontal array on a green background. The 9 combinations of red, yellow, and green backgrounds with vertical, 45°, and horizontal arrays of dots were presented in extinction. A conjoint-measurement analysis is discussed, and the orientation and color dimensions are shown to be independent and additive.—*Journal abstract.*

731. Rudy, Jerry W. (Princeton U) **Stimulus selection in animal conditioning and paired-associate learning: Variations in the associative process.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol 13(3), 282-296.—Notes that stimulus selection phenomena observed in both animal conditioning and paired-associate (PA) learning generally have been attributed to a selective attention process. Recently, however, some conditioning theorists have departed from an attentional view and have attributed stimulus selection to variations in the associative process. This paper surveys some recent developments in animal conditioning and argues that the emerging principle in this domain—that the associative process is engaged only to the extent that an unpredicted event is experienced—also has utility in dealing with PA findings. To this end, a theory is developed and applied to stimulus selection phenomena of PA learning and transfer. (35 ref)—*Journal abstract.*

732. Russell, P. A. & Williams, D. I. (U. Aberdeen, Scotland) **Effects of repeated testing on rats' locomotor activity in the open-field.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 109-111.—Tested 24 male PVG/C strain black-hooded rats over a series of 10 open-field trials. Results are consistent with reports that an initial decrement in ambulatory activity is followed by an increment. Alternative explanations of the effect are (a) that Trial-1 activity is influenced by a hyperactivity phenomenon unrelated to exploration and (b) that the effect stems from differential habituation of approach and avoidance tendencies. Comparison of the behavior of Ss tested with-without a small object in the center of the field leads to rejection of the former possibility, and it is suggested that the latter may account for some, though not all, of the effects of repeated testing on exploratory behavior.—*Journal abstract.*

733. Russell, P. A. (U. Aberdeen, Scotland) **Effects of fear on the behaviour of rats in an enclosed maze.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 112-115.—Test-

ed 28 female PVG/C strain black-hooded rats, chosen for high- and low-defecation scores, for 5 min on each of 5 consecutive days in an enclosed Y maze. High defecators entered fewer maze arms and showed more rapid habituation of arm entries, but overall alternation percentages did not differentiate the groups. High defecators also showed a preference for the novel arm on their 1st choice between this and the previously visited arm. Results are discussed in terms of differences in fearfulness between the groups and extend the generality of statements about fear and exploration while avoiding problems inherent when fear is manipulated by varying apparatus factors. (23 ref)—*Journal abstract.*

734. Scoble, Stanley R.; Gold, Dennis C. & Fallon, Daniel. (State U New York, Binghamton) **Reward and reward omission: Time-dependent aftereffects in rats and fish.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 452-454.—Both goldfish and rats responded faster on a trial following shortly after reward omission than on trials at longer intervals. On trials shortly after a reward, responding was slower than on trials at longer intervals. These reward omission effects are similar to the invigorating effects of frustrative nonreward.

735. Shanab, Mitri E. & Birnbaum, Dana W. (California State U, Fresno) **Durability of the partial reinforcement and partial delay of reinforcement extinction effects after minimal acquisition training.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 81-85.—Gave 4 groups of 10 male Sprague-Dawley albino rats each 6 acquisition trials (Phase 1) under continuous reinforcement, partial reinforcement, constant delay, or partial delay of reinforcement conditions. In Phase 2 all Ss were given 18 nonreinforced trials, followed by 12 continuously reinforced trials in Phase 3. In Phase 4 all Ss were given 12 more extinction trials. A constant 24-hr intertrial interval was observed throughout the experiment. A strong partial reinforcement extinction effect was obtained in both Phases 2 and 4. Only a temporary partial delay of reinforcement effect was observed, which was restricted to the 1st 9 trials of the 1st extinction phase. No constant delay of reinforcement effect was observed in either extinction phase. Results are discussed in terms of both frustration and sequential theories.—*Journal abstract.*

736. Shanab, Mitri E.; Cavallaro, Gerald & White, Reba. (California State U, Fresno) **Abolition of the partial reinforcement extinction effect (PREE) following extinction of the persistence mechanism.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 117-125.—Gave 3 groups of 30 male Sprague-Dawley albino rats either continuous, partial, or zero reinforcement in a 1st acquisition phase, followed by an extended extinction phase. All Ss were then given a reacquisition phase under continuous reinforcement conditions followed by a 2nd extinction phase. While the usual PREE was found during the major part of the 1st extinction phase, it disappeared during the last few trials of that phase. No PREE was obtained during the 2nd extinction phase in any of the 3 sections of the runway. The abolition of the PREE is attributed to the extinction of the mechanism relating fractional fractional of primary frustration responses to feedback stimuli in the partial reinforcement group.—*Journal abstract.*

737. Smart, J. L. (U Manchester, England) **Activity and exploratory behavior of adult offspring of undernourished mother rats.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 315-321.—Female black and white hooded Lister rats were either adequately fed or were undernourished during much of pregnancy and throughout lactation. Both control and undernourished (UN) offspring had free access to food from weaning. Pups were tested between 15 and 27 wks of age. During repeated exposures on the same day in a rectangular observation box, UN Ss moved about more and reared on their hind legs more often than controls, but defecated less frequently. 2 measures of exploratory behavior—tendency to emerge from a familiar to an unfamiliar area and responsiveness to a novel object—did not differentiate the 2 groups, nor did control and UN Ss differ in the rate at which they pressed a lever to produce a light stimulus in a dark Skinner box. Results indicate that previously undernourished rats are more active than controls in familiar, nonstressful situations. (15 ref)—*Journal abstract*.

738. Sprott, Richard L.; & Symons, James P. (Jackson Lab., Bar Harbor, Me.) **Operant performance in inbred mice.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 46-48.—Conducted experiments which successfully used standard operant procedures to condition mice to barpress for a food reward on a variety of schedules of reinforcement. The schedules included continuous reinforcement, 9 fixed-ratio values, and 6 fixed-interval values. 12 mice of each of 5 genotypes—C57BL/6J, DBA/2J, B6D2F, B6D2F<sub>1</sub>, ob/ob, and C57BL/6J (+/-)—were exposed to some or all of these schedules. Performance was typical of that observed in other organisms, and satiation was not a problem in sessions lasting from 2 to 3½ hrs. Results demonstrate that barpress performance can be obtained with inbred mice as readily as with other organisms.—*Journal abstract*.

739. Tarczyńska, Krystyna; Karliński, Andrzej & Sadowski, Bogdan. (Polish Academy of Sciences, Lab of Applied Physiology, Warsaw) **Method of evoking the instrumental water-rewarded conditioned reflexes in rabbits.** *Acta Physiologica Polonica*, 1972, Vol 23(6), 1103-1107.—Elaborates a method for studying the central mechanisms of thirst and water-electrolyte balance in rabbits. A device for studying instrumental conditioned responses, as well as the electronic circuit for automatic delivery of the conditioned stimulus and reinforcement are described. The experimental procedure, maintenance of rabbits during conditioning, results of instrumental responses, responses to situation and sporadic stimulus, and evaluation of the findings are presented.—*Journal abstract*.

740. Taylor, George T. (State University Coll New York, Potsdam) **Stimulus change and complexity in exploratory behavior.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 115-118.—Examined the relationship between changes in complexity and the consequent exploratory behavior in an experiment with 48 male albino rats. Following extended exposure to a midcomplexity stimulus, Ss were allowed to choose between a stimulus change and the now familiar midcomplexity stimulus. For some Ss the change was to a stimulus of higher complexity and for others to one of lower

complexity. Results suggest that physical stimulus changes to a stimulus of greater complexity is a more effective novel stimulus than physical stimulus changes to lesser complexity, although both changes may function as incentives. (15 ref)—*Journal abstract*.

741. Testa, Thomas J.; Juraska, Janice M. & Maier, Steven F. (U Illinois) **Prior exposure to inescapable electric shock in rats affects extinction behavior after the successful acquisition of an escape response.** *Learning & Motivation*, 1974(Aug), Vol 5(3), 380-392.—Describes 2 experiments with a total of 91 male Sprague-Dawley rats. In Exp I Ss exposed to 64 inescapable electric shocks in a restrainer or merely restrained were later given either 0, 5, 15, or 30 escape-avoidance training trials with a 2-way shuttlebox procedure that does not lead to interference with escape acquisition due to prior exposure to inescapable shock. After escape training all Ss were given an escape-avoidance extinction procedure in which shock was inescapable. Ss which had received exposure to shock responded less often and with longer latencies in extinction than did the restrained Ss. Exp II demonstrated that this effect was caused by the inescapability of the initial shock treatment. Results are explained in terms of (a) associative interference which minimized the effect of shuttlebox escape training for the preshocked Ss and (b) a stronger tendency to recognize the presence of an inescapable shock situation during extinction for the preshocked Ss.—*Journal abstract*.

742. Tondat, Lynn M. (Ohio U) **Is the effect of preshock treatment on shock-elicited aggression independent of situational stimuli?** *Psychological Record*, 1974(Sum), Vol 24(3), 409-417.—During a 4-day Preshock Phase, 64 male Holtzman rats were placed individually for 10 min/day in either Chamber A (illuminated) or Chamber B (pine-scented, not illuminated). Half of the Ss placed in each chamber received shock. During a 4-day Aggression Phase, pairs of Ss of the same preshock condition were placed in Chamber A and administered shock for 10 min/day. Regardless of the similarity of preshock and aggression chambers, preshocked Ss displayed less aggression than nonpreshocked Ss. The preshock effect is interpreted as being mediated by the stimulus consequences of shock.—*Journal abstract*.

743. Wasserman, Edward A. (U Iowa) **Stimulus-reinforcer predictiveness and selective discrimination learning in pigeons.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 284-297.—Conducted 3 experiments with a total of 80 homing pigeons and 10 hybrid cock pigeons to investigate selective discrimination learning during acquisition training. A 2-key autoshaping procedure was used in which Ss' responses to the common and distinctive elements of 2 successively presented compound visual stimuli were recorded separately. The difference between the correlations with reinforcement of the compound stimuli influenced between- and within-trial discrimination learning. The methods and findings of these experiments are discussed in terms of several views of stimulus selection in animal discrimination learning. (23 ref)—*Journal abstract*.

744. Williams, Ben A. (U California, San Diego) **Reward vs extinction in discrimination reversal learning.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol

3(6). 454-456.—Pigeons trained on a series of color-discrimination reversals were given either reward or extinction single-stimulus pretraining at various points during reversal learning improvement. Extinction of the previous positive stimulus facilitated reversal learning more than reward of the previous negative stimulus throughout training.

745. Williams, Donald T. & Ballenger, M. Mark. (York Coll, City U New York) **Successive contrast effects.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 43-50.—Tested 80 white Sprague-Dawley rats for positive and negative contrast effects with the use of a 2 × 2 design (6 or 1 45-mg pellet as reward in pre- or postshift phase) and with the use of the necessary methodological controls. Ss were run in a straight alley for 33 pre- and 10 postshift trials. A significant ( $p < .01$ ) negative contrast effect (NCE) was found, but there was no evidence of a positive contrast effect (PCE). It is concluded that the NCE is a viable behavioral phenomenon, whereas the PCE is questionable. (21 ref) —*Journal abstract.*

746. Yarcower, Matthew & Evans, Gary. (Bryn Mawr Coll) "Combined cue" test of conditioned inhibition in pigeons. *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 261-266.—Conducted an experiment with 15 Silver King pigeons to determine whether the amount of positive-stimulus (S+) training affects the amount of response suppression induced by superimposing a novel stimulus on the S+ stimulus (external inhibition). An increase in the amount of training was accompanied by a reduction in the amount of external inhibition. The reduction in suppression could not be attributed to differences in response rate or to changes in stimulus control by S+. Results of the present study, taken together with those of a prior study, support the suggestion that the degree of external inhibition is codetermined by the degree of S+ stimulus control and by the strength of the behavior controlled by S+. —*Journal abstract.*

747. Young, A. Grant; Hale, P. A. & Fuselier, G. D. (Louisiana State U, Baton Rouge) **A within-S test of the response specificity of the PRE.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 437-439.—Trained 64 male albino rats to leverpress in an operant chamber and to run a straight runway. Half of Ss were trained on a continuous reinforcement schedule (CRF), and the other half on a partial reinforcement schedule (PR). Upon completion of acquisition, the groups were subdivided and given acquisition training in the other apparatus, half under conditions of CRF and the other half under conditions of PR. Upon completion of acquisition on both pieces of apparatus, half of Ss in each subgroup were extinguished in the runway, and the other half were extinguished in the operant chamber. Results show that resistance to extinction of either response was a function only of the training reinforcement for that response, and was independent of the schedule of reinforcement received in training of the other response. Results are discussed in terms of the response specificity of the partial reinforcement effect. —*Journal abstract.*

748. Zerboglio, Dominic J. (U. Missouri, St. Louis) **Wild caught vs inbred mouse strains: Differences in wheel-turn avoidance learning.** *Bulletin of the Psycho-*

*nomic Society*, 1974(Jul), Vol. 4(1), 24-26.—12 Ss from each of 3 Bar Harbor inbred mouse strains—C57BL/6J, C3H/HeJ, and DBA/2J—and two wild caught but laboratory bred *Peromyscus* strains—*P. leucopus* and *P. maniculatus bairdi*—were compared over 8 days of acquisition training on a wheel-turn avoidance task. In the acquisition of the conditioned avoidance response, the Bar Harbor inbreds did not differ but were, as a group, significantly better than the wild caught strains. Differences in activity rate were also apparent but do not account for the differences in avoidance performance. —*Journal abstract.*

### Social & Sexual Behavior

749. Averhoff, W. W. & Richardson, R. H. (U Texas, Austin) **Pheromonal control of mating patterns in *Drosophila melanogaster*.** *Behavior Genetics*, 1974(Sep), Vol 4(3), 207-225.—Performed multiple-choice mating tests comparing the mating propensity among and within inbred lines for *Drosophila melanogaster*. Courtship activity, time to copulation, and assortative mating were all directly correlated with the degree of inbreeding. By the 8th generation of sibling mating, there was a 76% incidence of negative assortative mating in multiple-choice tests and a marked reduction of courtship behavior among siblings. Absence of sperm in the females of nonreproductive pairs indicated that much of the attrition of inbred lines was due to failure of siblings to mate. Olfactometer tests with either unrelated flies or collected pheromone samples as source material indicate that airborne chemosignals were required for initiation of courtship in *D. melanogaster*. Visual and audio cues were noncritical in *D. melanogaster* courtship and mating. It is suggested that intraspecific qualitative pheromone variation, at one or a few loci, is functioning as the control mechanism in selective mating. (22 ref) —*Journal abstract.*

750. Barash, David P. (U Washington) **The evolution of marmot societies: A general theory.** *Science*, 1974(Aug), Vol 185(4149), 415-420.—Discusses a series of studies which reveal consistent and predictable correlations between marmot environments and social systems that indicate the ways in which social behavior may be adjusted to local ecology. The effects of environment on dispersal of the species and on reproductive performance and the marmot's behavioral system of local population control are described. (22 ref)

751. Bauer, Richard H. & Turner, James H. (U. California, Medical School, Los Angeles) **Effects of social conditions and time of testing on activity and striking of goldfish (*Carassius auratus*).** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 12-14.—Separated pairs of goldfish by a clear Plexiglas sheet, an opaque sheet, or mirrors with the reflective surfaces toward the Ss ( $N = 21$ ). Horizontal activity, vertical activity, and striking for food pellets were recorded at 7:00 AM, 12:00 noon, and 4:00 PM for 14 days. Horizontal and vertical activity was greater at 12:00 and 4:00 than at 7:00, increased for approximately the 1st 8 days, and then declined slightly. By the 10th day, horizontal activity was greater for Ss with mirror-image stimulation and those separated by a clear Plexiglas sheet than for Ss separated by an opaque sheet. Striking for

food pellets was not altered by social conditions or time of testing. Results suggest that social facilitation of feeding is not related to increased activity, but probably requires competition for food.—*Journal abstract*.

752. Bengtsson, Hans. **Retinal stimulation underlying the approach responses of naive chicks toward moving objects of different diameters.** *Psychological Research Bulletin; Lund University*, 1974, Vol 14(2), 8 p.—Analyzed data from a study by A. H. Schulman et al (see PA, Vol 46:4455) which identified the visual stimulus conditions which elicit initial approach responses in neonate chicks in order to further determine critical features of the proximal retinal stimulation that evoke the approach response. Data show that the effectiveness of eliciting approach behavior to an object moving toward the chick is a function of the relative increase in speed of the object's visual angle.

753. Borchelt, Peter L. & Overmann, Stephen R. (Michigan State U) **Development of dustbathing in bobwhite quail: I. Effects of age, experience, texture of dust, strain, and social facilitation.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 305–313.—Found that quail chicks dustbathed in fine dust at an earlier age than in coarse dust. A different Age  $\times$  Experience developmental pattern was found for dustbathing in a different strain of Bobwhite quail. Chicks experienced in dustbathing facilitated significantly the development of dustbathing in naive chicks.

754. Box, Hilary O. & Pook, A. G. (U Reading, England) **A quantitative method for studying behaviour in small groups of monkeys in captivity.** *Primates*, 1974(Mar), Vol 15(1), 101–105.—Describes a method in which the behavior of individual animals is recorded to minimize order effects and observer differences in studying social behavior among a small group of captive monkeys. Gross activity profiles, obtained by using time sampling and a modified event recording technique, are presented.

755. Chamove, Arnold S. (U Stirling, Scotland) **A new primate social behaviour category system.** *Primates*, 1974(Mar), Vol 15(1), 85–99.—After a brief critical review of some primate behavioral recording techniques, a new device and scoring system is described. Frequency, duration, duration–frequency, and modified frequency data of a large number of behaviors can be obtained using this adding machine and printout counter. Data collected using this system are illustrated. (43 ref)

756. Chappell, Patricia F. & Meier, Gilbert W. (Boston U, Medical Ctr) **Behavior modification in a mother–infant dyad.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 296.—Made observations of an isolate-reared female rhesus monkey and her infant from Day 1 of the infant's birth until 4 mo later. The mother showed atypical behavior toward her infant, including omission of grooming, stereotypy, aggression, and frequent bouts of rejection.

757. Clark, Dennis L. & Kessler, Karen L. (U Arizona) **Pairwise dominance and social preference in squirrel monkeys.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1083–1090.—Observed 5 male and 5 female squirrel monkeys, previously tested for dominance, in a noncompetitive and social preference

situation. Following nonsocial adaptation trials, all possible pairs of monkeys were observed, one pairmate serving as S and the other as a stimulus animal in a free-choice preference test. Ss' latencies to enter the apparatus and activity levels were greatly reduced by the addition of social partners. While social choices were not influenced by the dominance of the stimulus animal, the sex of the stimulus monkey proved to be an effective variable in that females elicited more approach behaviors than males.—*Journal abstract*.

758. Connor, James L. (U Nebraska, Lincoln) **Waning and recovery of conspecific aggression in the house mouse (*Mus musculus* L.).** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 215–227.—Reports results of 3 experiments with a total of 254 wild, C57/BL6, and DBA/2 mice. 4-hr exposure to fighting opportunities depressed intermale mice to a low baseline level. A subsequent 18-hr restriction in fighting opportunities restored aggression to its previous level. The time course of these effects was the same whether aggression was measured as the proportion of time spent fighting, trial length, or attack-reinforced barpressing rates. Replacing familiar intruders with novel intruders failed to affect baseline aggression, aggressive waning, or aggressive recovery. Waning and recovery effects replicated across the outbred wild stock of mice and the aggressive inbred strain (C57/BL6) but failed to replicate with the relatively nonaggressive inbred strain (DBA/2). (27 ref)—*Journal abstract*.

759. Creer, Thomas L. (Children's Asthma Research Inst. & Hosp., Denver, Colo.) **Communal housing and shock-induced aggression.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 51–53.—In Exp I, testing, which began after 18 naive male Sprague-Dawley rats had been evenly divided and confined to 1 of 3 communal cages for 30 days, indicated that only 1 pair from each of the 3 cages exhibited high rates of fighting. The other 2 pairs in each cage displayed low and variable rates of aggression. In Exp II the Ss in each communal cage were paired in round-robin fashion with all cagemates. Results show that Ss displaying higher rates of aggression in Exp I again exhibited high frequencies of fighting. Rates displayed by other Ss were a function of the particular pairing. Thus, some Ss fought when confronted with a more aggressive protagonist. Others, however, did not fight, regardless of the composition of the match.—*Journal abstract*.

760. Dewsbury, D. A. (U Florida) **Copulatory behavior of California mice (*Peromyscus californicus*).** *Brain, Behavior & Evolution*, 1974, Vol 9(2), 95–106.—Observed 17 male–female pairs of California mice in 60 tests of copulatory behavior. Ss showed a pattern with no functional lock, intravaginal thrusting, ejaculation possible on single insertions, and multiple ejaculations. Results suggest that the evolution of copulatory behavior in hystricomorph and myomorph rodents is less divergent than previously proposed. (27 ref)—*Journal abstract*.

761. Dewsbury, Donald A. (U Florida) **Copulatory behavior of wild-trapped and laboratory-reared cactus mice (*Peromyscus eremicus*) from two natural populations.** *Behavioral Biology*, 1974(Jul), Vol 11(3), 315–326.—Observed copulatory behavior in 4–6 tests of each of 24 male–female pairs of cactus mice. Ss showed long

latencies to initiate copulation. Multiple intromissions with intravaginal thrusting always preceded ejaculation. Only 1 ejaculation occurred in most tests. Locking was observed on 1.5% of all copulations. Copulatory pattern showed little variation as a function of population and rearing condition. A total of 62.8% of all copulations occurred in incomplete series after the last ejaculation and sperm transfer. It is proposed that these "postejaculatory copulations" may either be necessary for induction of neuroendocrine reflexes in the female or increase male reproductive success by reducing the likelihood that the female will mate with a different male. (34 ref) —*Journal abstract*

762. Erwin, J.; Maple, T.; Willott, J. & Mitchell, G. (California, Davis) **Persistent peer attachments of rhesus monkeys: Responses to reunion after two years of separation.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1179-1183. — 6 male and 6 female 4½-yr-old rhesus monkeys were reunited with same-sex peers with which they had spent their 2nd yr of life. Responses of Ss to reunion with familiar animals were compared with their responses to pairing with unfamiliar same-sex peers. Ss displayed less aggression, fear submission, and disturbance, and more affiliation, while paired with familiar peers than with unfamiliar peers. —*Journal abstract*.

763. Ghitelli, William B. & Thor, Donald H. (Edward R. Johnstone Training & Research Center, Bordentown, N.J.) **The rodent model of irritable aggression: A method for analyses of individual roles in paired fighting.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 17-19. — Selected 10 pairs of Long-Evans male rats for reliable fighting to footshock. For each pair, 1 member on Day 1 (and the other member on Day 2) was temporarily rendered docile by local anesthesia of the vibrissal pad. Attack scores decreased ( $p < .0001$ ) when 1 member was anesthetized, but component elements of the score varied in direction. Biting increased ( $p < .001$ ) and boxing decreased ( $p < .0001$ ). Upright inherent ambiguity in standard observational measures of paired fighting behavior. The present method has evident potential for discriminating nonapparent dominance relationships in normally fighting pairs and for stabilizing aggressor-target roles in the shock-elicited aggression paradigm. (16 ref) —*Journal abstract*.

764. Gillett, Sylvia D. (U. York, England) **The role of integumental colour pattern in locust grouping.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 153-156. — Measured the social behavior of normally pigmented and albino locusts. Albino nymphs and adults grouped less than normal locusts. In mixed-animal tests albino locusts showed no increase in grouping, and normal locusts showed no decrease in grouping. (17 ref)

765. Grota, Lee J. (U. Rochester, School of Medicine & Dentistry) **Effects of litter size, age of young, and parity on foster mother behaviour in *Rattus norvegicus*.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 78-82. — Results of 2 experiments with female Sprague-Dawley albino rats show that maternal behavior in the presence of newborn pups was determined by the age and size of the litter independent of parity of the mother, previous experience with different-sized litters, and the number of days after delivery the measurements are taken. After fostering 10-day-old young, maternal behavior was

influenced by the age and size of the litter and also by the mother's previous experience with different-sized litters. —*Journal abstract*.

766. Heinz, Gary. (Patuxent Wildlife Research Center, Laurel, Md.) **Responses of ring-necked pheasant chicks (*Phasianus colchicus*) to conspecific calls.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 1-9. — Measured the locomotor responses of pheasant chicks to conspecific calls and the vocalizations of the chicks relating to their locomotor responses in a test apparatus permitting approach or retreat movements. The brood-gathering call and the content call elicited strong approach from chicks, whereas the alarm call and the squeak call inhibited locomotion. (19 ref)

767. Hinkel, Thomas J. & Maier, Richard. (Rockhurst Coll) **Isolation and aggression in Siamese fighting fish (*Betta splendens*).** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1323-1326. — Tested the hypothesis that animals show an increased tendency toward aggression as deprivation of fighting is extended. 60 male Siamese fighting fish were observed to determine aggressive display strength to a mirror image following 15 min or 6, 24, or 72 hrs of visual isolation. Results indicate shorter attack latencies and progressive increments for total time of gill-cover erections as the length of the isolation period was increased. —*Journal abstract*.

768. Hodgdon, Harry E. & Larson, Joseph S. (U. Massachusetts, Amherst) **Some sexual differences in behaviour within a colony of marked beavers (*Castor canadensis*).** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 147-152. — Studied social and construction behaviors of 8 beavers in the field in central Massachusetts. The colony was organized around the adult female. She emerged from the lodge first 93% of the time, tail-slapped twice as frequently as the adult male, was the alpha member of the family in dominance encounters, and elicited more calls from other beavers than any other animal. Tail-slapping by females was significantly more effective in causing beavers to move to deep water than tail-slaps by males. The adult female led the family in lodge maintenance, food cache building, and dam maintenance. The adult male performed close dam inspection twice as often as the adult female. (24 ref) —*Journal abstract*.

769. Howard, J. L.; Obrist, P. A.; Gaebelein, C. J. & Galosy, R. A. (U North Carolina, Chapel Hill) **Multiple somatic measures and heart rate during classical aversive conditioning in the cat.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 228-236. — In 2 experiments, a total of 9 freely moving cats were subjected to classical aversive conditioning under either a delay or a trace paradigm using a tone conditioned stimulus (CS) and a shock unconditioned stimulus (UCS). During a 7- or 9-sec CS-UCS interval, heart rate (HR) decelerated and concomitantly, general activity, neural activity in the pyramidal motor system, respiration amplitude, and neck muscle electromyogram (EMG) decreased. General activity and pyramidal activity were more related to HR than were respiration and EMG. The close correspondence between HR and the various measures of somatic activity are interpreted as showing the dependence of HR change on the metabolic demands of the organism. The concomitance

demonstrated between HR change and somatic change provides further evidence against HR change as a direct index of emotional or motivational processes. (24 ref)—*Journal abstract*.

770. Jensen, Gordon D. & Tokuda, Kisaburo. (U California, Davis) **Spatial organization of captive monkeys.** *Primates*, 1974(Mar), Vol 15(1), 75-83.—Formed an artificial group of 18 pigtailed monkeys, selected by sex and size (age) to simulate the composition of natural groups of macaques. All were strangers to each other. Observations were made over 5 mo of Ss' resting and clustering locations in a laboratory compound. Spatial organization was found to emerge about 1 mo after the group was formed when the group acquired a competent leader. The leader, certain high-ranking females, and/or females in estrus were seen consistently in a geographically central area of the compound and therefore were termed central monkeys. This central subgroup, coherent in terms of area and roles, persisted throughout the study. Development of increased group structure was also indicated by increased stability of dyadic affectional relationships. Results indicate that social organization of the pigtailed macaque will develop when some of the environmental and prior experience variables are controlled. The results highlight the leader's role and suggest that it is at least as essential in social organization as kinship and factors inherent in a natural environment. Estrous cycles of females and seasonal variations of temperature in the compound were other factors affecting spatial and social relationships of the group members.—*Journal abstract*.

771. Langford, Andrew & Hogan, Jerry A. (U. Toronto, Ontario, Canada) **Effects of chick vocalizations on ongoing behaviour.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 160-163.—Conducted 2 experiments with a total of 48 Burmese red jungle-fowl chicks. Recorded feeding twitters, shrill calls, and tones of 2 intensities were presented to Ss that were pecking a key for food on a variable interval schedule of reinforcement. The shrill calls and tones had an immediate inhibitory effect on pecking which dissipated in about 5 min. Feeding twitters had no effect on pecking rate. (17 ref)—*Journal abstract*.

772. Larsson, K., et al. (U Göteborg, Unit of Psychobiology, Sweden) **Delayed onset of sexual activity of male rats subjected to pre- and postnatal undernutrition.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 307-311.—Subjected male Sprague-Dawley rats to pre- and postnatal undernutrition and studied their sexual and locomotive behavior. The underfed Ss were slower in initiating sexual behavior than the intact ones, and some of the Ss never showed any mounting behavior during the period of testing. Occurrence of spermatozoa in a penile smear was delayed in the underfed Ss. The Ss subjected to restricted food consumption showed an increased locomotive activity in an open field situation, but habituation occurred at a normal rate.—*Journal abstract*.

773. Levine, John M. & Zentall, Thomas R. (U Pittsburgh) **Effect of a conspecific's presence on deprived rats' performance: Social facilitation vs distraction/imitation.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 119-122.—Investigated effects of

(a) conspecific's "mere presence" and (b) water deprivation on emission of dominant responses by rats. R. B. Zajonc (see PA, Vol 39:16348) suggested that a conspecific's presence functions like a physiologically based drive in enhancing performance of dominant responses. Alternative interpretations suggest that a conspecific's presence impairs performance by distracting the O or eliciting imitation of irrelevant responses. The social facilitation vs distraction-imitation hypotheses were tested in a 2 × 2 design: 32 barpress-trained male Long-Evans rats, deprived of water for 4 or 23 hrs, barpressed for water in the presence of a naive rat or alone. Results support social facilitation theory: Performance was significantly higher when the conspecific was present rather than absent and when the responder was 23 hrs rather than 4 hrs deprived. It is suggested that degree of contact may be important in determining how a conspecific's presence affects performance of dominant responses. (25 ref)—*Journal abstract*.

774. Martin, J. (Utah State U) **Copulatory and vocal behavior of a pair of whiskered owls.** *Auk*, 1974(Jul), Vol 91(3), 619-624.—Describes 2 songs and other vocal displays of a single pair of whiskered owls and the contexts in which the vocalizations were used, particularly before, during, and after copulation.

775. Michener, Gail R. (U Saskatchewan, Regina, Canada) **Development of adult-young identification in Richardson's ground squirrel.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 375-384.—8 adult female ground squirrels were paired in an observation box with their own young and with unrelated young aged 20-24 days through 40-44 days. Social discrimination was characterized by a predominance of cohesive over agonistic contacts between related pairs, and a predominance of agonistic over cohesive contacts between unrelated pairs. Both adults and young were capable of identifying the other S as familiar or unfamiliar. Adults did not pick up or carry young aged over 29 days. Young that were not carried could identify adults at 20-24 days of age when the eyes were still closed. They responded cohesively with the mother and submissively with the unrelated adult. This pattern of behavior was maintained after the eyes opened. Adults initiated fewer contacts than young; the majority of their responses involved nasal investigation of the young. (24 ref)—*Journal abstract*.

776. Michener, Gail R. (U. Cape Coast, Ghana) **Maternal behaviour in Richardson's ground squirrel (*Spermophilus richardsonii richardsonii*): Retrieval of young by non-lactating females.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 157-159.—Investigated retrieval of ground-squirrel young by females which had littered in the previous year and by virgins. More (5 of 6) nonparous mothers retrieved than did virgins (1 of 7). Ss which did not retrieve attacked the young. Ss which retrieved also exhibited other maternal responses (cleaning, nidification, and lactation position). Results suggest that previous parity has a long-lasting effect on the response of nonlactating females to young. (17 ref)—*Journal abstract*.

777. Newman, John D. & Symmes, David. (NIH, Inst of Child Health & Human Development, Behavioral Biology Branch, Bethesda, MD) **Vocal pathology in**

**socially deprived monkeys.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 351-358.—Found structural abnormalities in the clear calls of 2 male and 2 female rhesus monkeys raised in partial social isolation. These abnormalities included abrupt pitch changes, harmonic emphasis shifts, temporal discontinuity, and lack of the characteristic inflection found in such calls from 2 male and 1 female mother-reared controls. Other forms of vocalization appeared structurally normal. Vocal pathologies were distinctive for each isolate tested, and persisted over the age range of 8-24 mo. (16 ref)

—*Journal abstract.*

778. Norikoshi, Kohsiki. (Osaka City U, Japan) **The development of peer-mate relationships in Japanese macaque infants.** *Primates*, 1974(Mar), Vol 15(1), 39-46.—Studied the play behavior of Japanese macaque infants in the field for 6 mo at Arashiyama, Japan. 3 types of play were identified. The 1st (solitary play) was observed in 5-12 wk old infants. The 2nd type of play (parallel play) was observed in infants from 12 to 21 wks old. After the 12th wk, the 3rd type of play (associate play) was seen. At this point the infants seldom played without partners. It is in associate play that dominant and submissive behavior may be seen, and from which dominance relations may be assumed. It is suggested that the rank of a 12-wk-old infant parallels that of its mother. (16 ref)—*Journal abstract.*

779. Pruzan, Anita & Ehrman, Lee. (Hunter Coll, City U New York) **Age, experience, and rare-male mating advantages in *Drosophila pseudoobscura*.** *Behavior Genetics*, 1974(Jun), Vol 4(2), 159-164.—Examined frequency-dependent sexual selection in female *Drosophila* who differed in age and in previous mating experiences. Direct observation tests were conducted employing females of the previously described Arrowhead (AR) and Chiricahua (CH) homokaryotypes. 4-day-old virgin females conferred mating advantages on all tested rare males or, AR, AR, and CH). Females that had a previous mating experience when younger awarded a rare-male advantage only when the rare male was of the same genotype of karyotype as their 1st mate, and matings were random when the 1st-mate type males were common. Equivalently aged (11 days) virgin females mated significantly more than expected with minority males if they were of the same karyotype as the females themselves, whereas matings were near random when the males were different. Frequency-dependent mating, therefore, is both age and experience dependent. —*Journal abstract.*

780. Rosenson, Leon M. (Richard Stockton State Coll.) **Group formation in the captive greater bushbaby (*Galago crassicaudatus crassicaudatus*).** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 67-77.—1 male and 3 female bushbabies were released into a room and observed for 30 days. Consistent relationships, but no straight-line hierarchy, were formed. Grooming and marking were the most frequent activities. Females fought over proximity to the male even though none were in estrus. One female initiated over 90% of agonistic encounters. When she was removed for 9 days the remaining Ss continued their friendly relations; when she was returned she briefly reasserted dominance over the other 2 females. (21 ref)

—*Journal abstract.*

781. Russock, Howard I. & Schein, Martin W. (West Virginia U) **Effect of early experience and age on initial responsiveness of *Tilapia mossambica* fry to a maternal model.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 111-114.—High levels of responsiveness were exhibited by all fry of a maternal mouth-brooding fish regardless of rearing experience, indicating that responsiveness to the mother's mouth is fully developed at birth and needs no previous social experience for its expression. It was also found that naive fry were strongly attracted to the model at 13 and 16 days of age but were neutral or actively avoiding it at 26 days of age. This decline is almost identical to the decline in responsiveness of normally reared fry toward their actual mother.

782. Sachs, Benjamin D.; Macalone, Roger & Fegy, Linda. (U Connecticut) **Pacing of copulatory behavior in the male rat: Effects of receptive females and intermittent shocks.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 326-331.—Describes 2 experiments with 7 male hooded Long-Evans rats. In Exp I, Ss were tested with females continuously present and with the presence of the female after each sex act contingent upon a barpress. The sole effect of the barpress requirement was to increase the intervals between copulations before ejaculation. In Exp II, intermittent shocks were superimposed upon the conditions of Exp I. Shocks were followed with short latency by mounts in the ad-lib condition and by barpress and mounts in the operant condition. The pacing of copulatory acts before ejaculation is inferred to result from an interaction of stimuli from the female and feedback from the copulatory acts; after ejaculation, factors primarily endogenous to the male govern the timing of resumption of copulation. (18 ref)—*Journal abstract.*

783. Suomi, S. J.; Eisele, C. D.; Grady, S. A. & Tripp, R. L. (U Wisconsin, Primate Lab, Madison) **Social preferences of monkeys reared in an enriched laboratory social environment.** *Child Development*, 1973(Sep), Vol 44(3), 451-460.—Each of 26 1-mo to 4-yr-old rhesus monkeys who had been reared in a nuclear family environment with continual access to mother, father, and siblings and with limited access to other parents and their offspring were tested individually for preferences between (a) mother, familiar adult female, and unfamiliar adult female; (b) father, familiar adult male, and unfamiliar adult male; (c) sibling, familiar peer, and unfamiliar peer; and (d) mother and father. Ss of all ages preferred their mothers to other adult females, preferred their fathers to other adult males, preferred their mothers to their fathers, but exhibited no preference among siblings and peers. (25 ref)—*Journal abstract.*

784. Syme, G. J. & Doak, J. B. (U Western Australia, Nedlands) **Problems in the analysis of competitive data.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 69-74.—A review of the literature indicates that while a number of studies have investigated the effects of experimental manipulations on the competitive behavior of laboratory rodents, little systematization has been achieved in either experimental design or statistical analyses. A review of the analyses used in a number of competitive studies leads to the conclusion that between-group competitive experiments should be analyzed with one-sample statistics. It is

suggested that if the one-sample chi square is used, the expected frequency should be calculated from the number of Ss in the experimental group. Reanalysis of some competitive experiments is recommended. (18 ref)—*Journal abstract*.

785. Van Deventer, John . (U Wisconsin Ctr, Marshfield) **The behavior of two species of planaria in confined spaces.** *Psychological Record*, 1974(Sum), Vol 24(3), 379-384.—Conducted 2 studies which examined the behavior of 100 *Cura foremanii* and 100 *Dugesia tigrina* in large and small spaces. It was found that the smaller the space (the greater the probability of contact with a corner for rectangular spaces and the greater the degree of angularity for cylindrical spaces), the shorter the mean time to cessation of locomotion. When given a choice between settling in a large or a small volume under diurnal conditions, both *C. foremanii* and *D. tigrina* chose the small volume. With continuous darkness, while *D. tigrina* appeared to continue to choose the smaller volume, *C. foremanii* avoided it. The behavior is explained as an interaction of chemotaxis and positive thigmotaxis.—*Journal abstract*.

### Sensory Processes

786. Capps, Mary J. & Preciado, Manuel C. (U Minnesota, Medical School) **Vestibular habituation in paralyzed cats.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 272-276.—Studied the role of the eye movement response in the production of vestibular habituation in 12 cats. One group of Ss was subjected to an habituation series of 15 unilateral caloric irrigations while paralyzed with gallamine triethiodide. A 2nd group underwent an identical habituation procedure but was not paralyzed. Tests conducted following recovery from paralysis showed that the responses of the previously is Ss were habituated and did not differ from the responses of Ss habituated in a normal manner. Data support a central origin for the phenomenon of vestibular habituation.—*Journal abstract*.

787. Carricaburu, Pierre . (National Museum of Natural History, Paris, France) **[Under what aspect do insects see colored objects?]** (Fren) *Vision Research*, 1974(Aug), Vol 14(8), 671-675.—Used color photography to study insect color vision. A trichromatic selection was made through 3 filters—ultraviolet, blue, and green—and the 3 negatives were printed through 3 filters—blue, green, and red. Striking differences from human color vision were observed. (French, German, & Russian summaries)

788. Gold, Richard M. & Prowse, James . (U Massachusetts, Amherst) **Water temperature preference shifts during hydration.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 291-296.—In 3 experiments, 18 thirsty female Carworth albino rats chose cool water over warm water at the beginning of daily 2-choice drinking sessions, but after 6-8 min of drinking their preference shifted to warm water. The temperature preference shift persisted when the Ss were hyperthermic, thus ruling out thermoregulation as an explanatory mechanism. Hydration, not thermoregulation, appeared to mediate the shift in water temperature preference. When only cool water was available at the end of the drinking session (nonpreferred) total water intake was

suppressed. The same amount of cool water at the beginning of the drinking session (preferred) did not suppress water intake. Thus the cool to warm water temperature preference shift explains how cool water can be both rewarding and satiating.—*Journal abstract*.

789. Herman, Louis M. & Arbeit, William R. (U Hawaii) **Frequency difference limens in the bottlenose dolphin: 1-70 Kc/s.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 109-120.—Obtained frequency difference limens (DL) for an Atlantic bottlenose dolphin, *Tursiops truncatus* (Montagu) for 1, 6, 12, 19, 27, 36, 50, and 70 kHz. Ss were required to select the pure tone signal from a sequential pair consisting of a pure tone signal and a frequency-modulated (FM) signal of the same center frequency. Using a threshold-tracking procedure, the percent-frequency (EP) the FM signal was reduced following correct responses and increased following errors, providing estimates of the minimum deviation required for correct discrimination. The effects of modulation rates of 1 and 2 Hz were also studied. Thresholds and threshold variability were lowest for the 2-Hz rate. Relative DLs ( $\Delta F/F$ ) were roughly constant (.002-.003) for 6-50 kHz but were elevated for 1 kHz and 70 kHz. Results indicate exceptionally fine frequency discrimination by *T. truncatus* between 6 and 50 kHz.—M. B. Meikle.

790. Hoppe, Susan A. & Langford, Ted L. (Purdue U) **Binaural interaction in cat and man: I. Signal detection and noise cross correlation.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1263-1265.—Studied detection of diotic 500-Hz tones partially masked by diotic and dichotic noise in 2 cats and compared the results with similar detection data for 2 human Ss. The interaural correlation of the masker was varied by delaying the channel to 1 ear from 0 to 5 msec in steps of 1 msec. The absolute sensitivity of the cat was less than that of man, and smaller masking-level differences were found for the cat at each delay. The temporal interval over which the binaural system of the cat was able to effect a correlation between events occurring at the 2 ears was smaller than in man, while the critical band appeared to be wider. (15 ref)—*Journal abstract*.

791. Kelly, Jack B. (Carleton U, Ottawa, Ontario, Canada) **Localization of paired sound sources in the rat: Small time differences.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1277-1284.—Trained 17 male Wistar albino rats to perform 2 sound-localization tasks with single and paired sound sources. All Ss were first trained to detect a change from a series of single clicks on the left to a series on the right. They were then given training with paired clicks separated by a small time interval; the discrimination was between left-right pairs and right-left pairs. 5 Ss were given further tests with smaller values using the method of constant stimuli. Transition from single to paired clicks occurred for values between .5 and 4.0 msec. Ability to discriminate paired clicks was demonstrated for values between .25 and 16.0 msec. The limits for discrimination ranged from 62  $\mu$ sec to 32 msec. Results are discussed in relation to the precedence effect in human hearing. (17 ref)—*Journal abstract*.

792. Laursen, A. Mosfeldt & Rasmussen, J. Born. (Inst of Neurophysiology, Lab of Behavioral Physiology, Copenhagen, Denmark) **Circle-ellipse discrimination in monkeys: Comparison of titration schedules with the method of limits.** *Biological Psychology*, 1974, Vol 1(4), 293-301.—Reinforced 3 male vervet monkeys with food pellets for choosing a response key with a back-projected circle from among 7 keys with identical ellipses. Ellipse ratios from .400 to .985 were available in 18 discrete steps. Schedules were tested in the following sequence: (a) A titration schedule was used with different up-and-down transformed response rules. Training began with a rule of 3:1 indicating that after 3 correct responses the next trial presented ellipse ratios 1 step higher. A change to a lower ratio occurred after 1 incorrect response, and subsequently, up-and-down rules from 1:3 to 9:1 were tested, 1 rule per session. (b) The method of limits was then used in which 1 ellipse ratio was tested per session, first in a sequence of increasing and then of decreasing ratio. (c) Finally, a titration schedule with sequential likelihood ratio tests was employed. A target probability of correct responses was approached by deciding after each trial whether to change to a larger or to a smaller ellipse ratio. Psychometric functions derived from Schedules (a) and (b) coincided. Schedule (c) produced oscillations in the difficulty of the presented stimuli. It is concluded that discrete trial titration schedules with different up-and-down transformed response rules provided reliable measures of threshold in a visual shape discrimination.—*Journal abstract*.
793. LaVail, Matthew M.; Sidman, Murray; Rausin, Ricki & Sidman, Richard L. (Harvard U, Medical School, Boston) **Discrimination of light intensity by rats with inherited retinal degeneration: A behavioral and cytological study.** *Vision Research*, 1974(Aug), Vol 14 (8), 693-702.—4 rats of the Royal College of Surgeons (RCS) strain with inherited retinal degeneration suppressed leverpressing behavior in response to onset of light at ages 6 mo to more than 2 yrs. Control experiments established that the Ss were responding to light rather than to some other stimulus, and that the response was mediated by the eyes. Electron microscopic examination of the retinas demonstrated numerous surviving photoreceptor cells which lacked outer segments but which did make synaptic contact with presumed bipolar and/or horizontal cell processes. Counts of conventional and ribbon synapses in the inner plexiform layer showed that the circuitry through the retinas was relatively well preserved. Pigment epithelial cells made tight and gap junctions with Müller cell processes, which in turn were apposed to the photoreceptor cells. Possible cellular mechanisms mediating visual behavior in RCS rats are discussed. (French, German, & Russian summaries) (41 ref)—*Journal abstract*.
794. Martin, Graham R. & Gordon, Ian E. (U Exeter, England) **Increment-threshold spectral sensitivity in the tawny owl (*Strix aluco*).** *Vision Research*, 1974(Aug), Vol 14(8), 615-621.—Behaviorally determined photopic spectral sensitivity functions in 3 tawny owls, using a 2-choice simultaneous discrimination procedure. The functions obtained from the 3 Ss showed very close agreement. All had maximum sensitivity at about 580 nm, and in 2 of the Ss a submaximum at about 525 nm was evident. A comparison is made between this function and that from 2 humans tested in the same apparatus. The possible effects of selective absorption by preretinal media on the owl's function are considered. (French, German, & Russian summaries) (47 ref)—*Journal abstract*.
795. Popper, Arthur N.; Salmon, Michael & Parvulescu, Antares. (U. Hawaii) **Sound localization by the Hawaiian squirrelfishes, *Myripristis berndti* and *M. argyromus*.** *Animal Behaviour*, 1973(Feb), Vol. 21(1), 86-97.—Investigated sound localization in a large pond which opened into a bay and was similar to the normal environment of squirrelfish. Observations were made of movements towards 1 of 2 underwater loud speakers emitting squirrelfish alarm calls normally produced in response to predators. When the sound source was within 2.0 m of the test cage housing the Ss, they faced and moved toward the speaker. Ss responded some of the time when the source was within 3.0 m but generally did not orient to the sound source when the speaker was beyond 3.0 m. Response loss was correlated with the S being in the acoustic far-field. Possible cues which release and direct localization remain unknown, but include particle velocity information alone, or some change in relationships between particle velocity and pressure. (29 ref)—*Journal abstract*.
796. Porter, Richard H. & Czaplinski, James A. (George Peabody Coll for Teachers, John F. Kennedy Ctr for Research on Education & Human Development) **Responses of water snakes (*Natrix r. rhombifera*) and garter snakes (*Thamnophis sirtalis*) to chemical cues.** *Animal Learning & Behavior*, 1974(May), Vol 2(2), 129-132.—Conducted 5 experiments with a total of 10 water snakes and 24 garter snakes. In a series of simultaneous 2-choice preference tests, water snakes displayed a significant preference for a clean area of a test chamber vs an area soiled by a conspecific. No differential responsiveness was found for a clean area as compared to an area soiled by either a sympatric species of garter snake or by the individual water snake Ss. A similar series of tests with individual garter snakes revealed significant preferences for areas soiled either by the Ss themselves or by conspecifics as compared to clean areas. No preferences were found for a clean area of the test chamber vs an area soiled by a sympatric water snake. The possible role of chemical cues in the mediation of dispersion and social responsiveness is discussed.—*Journal abstract*.
797. Robinson, John S. & Fish, Stephen E. (Sonoma State Hosp. Brain-Behavior Research Ctr, Eldridge, CA) **A cat's form-experienced but visual-motor deprived eye lacks focal vision.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 331-342.—Allowed 6 laboratory-reared cats to move about freely from birth to 18 mo with 1 eye open; the other eye was open during daily 1-hr periods of binocular exposure in a holder, but was deprived of all visual-motor experience. Focal vision failed to develop in the deprived eye (DE). The DE's guidance deficit was especially pronounced for targets in the central field and in the photopic light range (it was much smaller in the periphery and in the mesopic range). Conjugate eye control, required for binocular fixation of objects in focal viewing, was disrupted by strabismus (squint). The identification function of focal vision was

virtually absent in the DE—it showed only slight recognition of patterns learned by the experienced eye and little ability to learn to identify them itself. (23 ref)—*Journal abstract*.

798. Simner, Marvin L. (U Western Ontario, London, Canada) **Effects of early posthatch exposure to intermittent light on visual flicker rate preference in chicks.** *Journal of Comparative & Physiological Psychology*, 1974(Aug), Vol 87(2), 267-271.—Gave independent groups of newly hatched White Leghorn chicks ( $N = 45$ ) 15 hr of continuous exposure to several rates of flashing white light during the period when the naive preference for a 4 flash/sec rate over a nonflashing light began to emerge. Tests conducted immediately following termination of exposure showed that although this treatment generated a marked reduction in locomotor activity and distress calling, it produced no change in the Ss' naive flash rate preference. (23 ref)—*Journal abstract*.

799. Tavalga, William N. (American Museum of Natural History, New York, NY) **Signal/noise ratio and the critical band in fishes.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1323-1333.—Measured auditory thresholds in 10 Ss from each of 3 teleost species: goldfish (*Carassius auratus*), pin fish (*Lagodon rhomboides*), and African mouth-breeder (*Tilapia macrocephala*). In the goldfish, the signal-to-noise ratio to broad-band noise was about 22 db, and direct measurement of the critical band yielded a value between 100 and 200 Hz. Single-tone masking effects in the goldfish showed partial remote masking and strong masking at frequencies within 5 to 20 Hz of the signal. Audiograms for pinfish and *Tilapia* were significantly higher than in the goldfish, but the signal-to-noise ratio values were in the same range. The evidence supports the existence of a critical band in the goldfish, but not in the other species tested. The relationship of signal-to-noise ratio to the critical band is discussed in reference to the frequency-discrimination capacities and hearing mechanisms in fishes. (54 ref)—*Journal abstract*.

800. Yamamoto, Takashi & Kawamura, Yojiro. (Osaka U, Dental School, Japan) **An off-type response of the chorda tympani nerve in the rat.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 239-243.—Elicited a transient burst activity in the chorda tympani nerve of 27 Wistar albino rats with a water rinse (off-type response) after a sucrose solution had been previously applied to the tongue. A possible mechanism for the generation of this response is suggested, and 2 different acceptor groups in the sugar-sensitive macromolecule are hypothesized. (16 ref)

801. Yamamoto, Takashi & Kawamura, Yojiro. (Osaka U, Dental School, Japan) **Chloroform responses of the chorda tympani nerve in the rat.** *Physiology & Behavior*, 1974(Aug), Vol 13(2), 245-250.—Application of chloroform solution to the tongues of 35 Wistar albino rats did not produce an off-type response in the chorda tympani nerve, following subsequent water rinse, as did the application of a sucrose solution. Effects of some metallic ions on the response to chloroform were also different from those on the sucrose response and suggest that sucrose and chloroform combine to the different loci within the same taste-receptor macromolecule.

## DEVELOPMENTAL PSYCHOLOGY

802. ———. **Abstracts and bibliography.** *Child Development*, 1974(Jun), Vol 48(3-4), 129-280.—Presents a collection of 427 abstracts of journal articles and books on various aspects of child development, including biology, clinical medicine and public health, developmental and comparative psychology, personality, social psychology, and education and counseling.

803. Adams, Gerald R. (Pennsylvania State U, Coll of Human Development, Div of Individual & Family Studies) **An investigation of differential reinforced imitation training on imitative behavior.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 221-233.—Examined the function of reinforcement as a performance vs a learning variable using varying imitation training conditions with 40 black and 40 white nursery-school children. The analysis consisted of 5 2 (Testing Situation)  $\times$  2 (White vs Black Children)  $\times$  8 (Training Conditions) factorials with the use of an analysis of variance technique. Results question the hypothesis that reinforcement is only a performance variable. Partial support is provided for the assumption that imitative behavior may be maintained through similarity of responding where imitation has been acquired through a strong history of reinforcement for imitation. Few racial differences were discovered. (17 ref)—*Journal abstract*.

804. Belmont, Ira. (Albert Einstein Coll of Medicine, Rose F. Kennedy Ctr for Research in Mental Retardation & Human Development, Yeshiva U) **Requirements of the early reading task.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 527-537.—Discusses the specific requirements of the early reading task and identifies related competencies which children must develop if they are to meet the requirements successfully. (36 ref)

805. Bohannon, John N. & Friedlander, Bernard Z. (U. Hartford) **The effect of intonation on syntax recognition in elementary school children.** *Child Development*, 1973(Sep), Vol. 44(3), 675-677.—Administered an automated evaluation of selective listening to story narratives to 60 children in kindergarten through 5th grade to test the general proposition that children manifest a shift in critical language listening from voice intonation to coherent meaning as a function of age. 10 children at each grade level were given a choice between a meaningless (randomized syntax) narrative with a lively intonation and the same story with meaningful (normal syntax) narration but monotonous intonation. Kindergarten and 1st-grade children used the flat intonation pattern as a cue to choose the more meaningful story version, and there was significant development toward more decisive selection for meaning in the higher grades. —*Journal abstract*.

806. Bower, T. G. (U Edinburgh, Scotland) **Development in infancy.** San Francisco, CA: W. H. Freeman, 1974. viii, 258 p. \$10(cloth), \$5.95(paper).—Details methods in current use to obtain information from infants and elucidates the processes whereby infants develop their necessary capacities, particularly cognitive. Results of investigations of infants' space perception, radial localization by eye, perception of distance, object perception, and development of motor behavior are included. (10 p ref)

807. Buss, Allan R. (U Alberta, Ctr for Advanced Study in Theoretical Psychology, Edmonton, Canada) **A recursive-nonrecursive factor model and developmental causal networks.** *Human Development*, 1974, Vol 17(2), 139-151.—Presents a model in which both unidirectional (recursive) and bidirectional (nonrecursive) influence properties are considered. The distinction of between vs within domain factors generates 4 major types of models. The components may assume any of the following: lower-order factors, higher-order factors, simple variables, and complex criterion variables. Some of R. B. Cattell's developmental theory is related to the present model. (30 ref)

808. Butzin, Clifford A. & Anderson, Norman H. (U California, San Diego) **Functional measurement of children's judgments.** *Child Development*, 1973(Sep), Vol 44(3), 529-537.—30 5-13 yr olds judged attractiveness of pairs of toys in a  $3 \times 3$  design. These judgments obeyed the parallelism prediction of information integration theory, thus supporting either an adding or an averaging model. An auxiliary critical test eliminated the adding model. Quite similar results were obtained for children 5-7 yrs old and children 7-13. Results extend the range of the averaging hypothesis of general integration theory from adults to children. They also illustrate the applicability of functional measurement methodology to obtain interval scales of subjective value for the individual child. (16 ref)—*Journal abstract*.

809. Cantwell, Zita M. & Svajian, Pergrouhi N. (Brooklyn Coll, City U New York) **Adolescence: Studies in development.** Itasca, IL: F. E. Peacock, 1974. x, 526 p. \$7.50.—Presents a collection of 33 papers on genetic and environmental factors in human development and their application to concepts of adolescence. The personal individuality and interpersonal relationships of the adolescent are discussed, as well as his moral development, language, abilities, motivations, and transition to adulthood.

810. Carmean, Stephen L. (Western Washington State Coll) **Procedure, timing, and task difficulty as moderators of the effect of vocalization of choices during discrimination learning.** *Child Development*, 1973(Sep), Vol 44(3), 693-696.—Conducted 4 experiments differing in the age of Ss (undergraduates or 3rd graders), time of vocalization (before or after responding), and procedure (vocalizing choices with or without correction, or nonvocal with or without correction) to determine if vocalization of responses affects performance in a discrimination learning task. Results indicate that the type of procedure (corrective or noncorrective) acts as a moderator of the effect of vocalization and that the timing of the vocalization and task difficulty are also relevant variables.—*Journal abstract*.

811. Corsini, David A. & Berg, Allan J. (U Connecticut) **Inter-task correspondence in the five to seven shift: Transposition, cue interference, and spatial memory.** *Child Development*, 1973(Sep), Vol 44(3), 467-475.—Examined the interrelationships of performance across 3 tasks (transposition, tactual cue interference, and memory for spatial placements) in 45 4-, 6-, and 8-yr-old children. Significant developmental differences were observed on each of the 3 tasks. The pattern of intercorrelations suggests a high degree of correspond-

ence between tasks. Original learning in the transposition task was related only to form discrimination without interference; form discrimination without interference was moderately related to the other 3 measures; and the 2 criteria measures—form discrimination with interference and spatial memory—were highly related. This pattern, plus a significant correlation between spatial memory and cue interference for each age group, suggests that there may be a common unitary process accounting for a moderate portion of the variance in these tasks.—*Journal abstract*.

812. Dewing, Kathleen & Kennealy, Noreen. **Age-related differences in spatial position and serial position effects in short-term memory.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 277-286.—Trained 4 groups of 40 Ss each, aged 4-5 yrs, 6-7 yrs, 12-13 yrs, and young adult undergraduates, on stimulus displays depicting 4 familiar, easily labelled objects. Ss were tested for recall with a test stimulus showing 1 of the 4 objects in the training display and a dotted blank in the position to be tested. The effect of the spatial location of various components of the stimulus display was examined. Spatial position influenced the recall performance of the 2 younger groups but not that of the older children or adults. Age-related differences in the use of spatial cues are discussed in terms of other relevant investigations. The effect of the temporal presentation order of the stimulus displays was analyzed and revealed age-related differences. Strong primacy effects were evident for the 3 older groups but not for the kindergartners. Implications of the results are discussed in relation to current theories of verbal mediation. (21 ref)—*Journal abstract*.

813. Di Simoni, Frank G. (East Stroudsburg State Coll) **Influence of utterance length upon bilabial closure duration for /p/ in three-, six-, and nine-year-old children.** *Journal of the Acoustical Society of America*, 1974(Jun), Vol 55(6), 1353-1354.—Examined aspects of the chronological sequence of development of durational control systems in 30 3-, 6-, and 9-yr-old children. The effect of utterance length of stimulus material on phoneme duration, previously noted for adults, was present in the speech of the 3-yr-old Ss. Results suggest the possibility of a hierarchy of coarticulatory functions.

814. Golomb, Claire. (Brandeis U) **Young children's sculpture and drawing: A study in representational development.** Cambridge, MA: Harvard University Press, 1974. xiii, 197 p.—Presents a study of 300 children between the ages of 2 and 7 in the US and Israel which traced the development of the human figure in 2 different media—drawing and modeling. The book is illustrated with more than 100 drawings and sculptures that retain the children's spontaneous remarks.

815. Greenberg, David J.; O'Donnell, William J. & Crawford, Donald. (U Illinois, Medical Ctr, Chicago) **Complexity levels, habituation, and individual differences in early infancy.** *Child Development*, 1973(Sep), Vol 44(3), 569-574.—Administered a rate-of-habituation and a complexity-level test to 51 11-wk-old infants. As predicted, those Ss who habituated rapidly (rapidly decreased their looking time to a single repeated stimulus in the habituation test) looked longer at the more complex patterns in the complexity test. The majority of

Ss with irregular habituation patterns resembled the slow habituators in terms of level of complexity preferred while the remaining irregular habituators appeared to respond randomly to both attentional tests. (17 ref)—*Journal abstract.*

816. Grunebaum, Henry; Weiss, Justin L.; Gallant, David & Cohler, Bertram J. (Harvard U, Medical School, Boston) **Attention in young children of psychotic mothers.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 887-891.—Compared findings from investigations of 68 1-6 yr old children of psychotic mothers and 68 1-6 yr old children of normal matched control mothers. 1-yr-old children were administered the Escalona scale of object permanence, and all age groups and parents completed appropriate versions of the Embedded Figures Test. 5-6 yr olds and their parents completed the Continuous Performance Test (CPT), a repetitive visual task requiring sustained attention. Behavior of children in the testing situation was observed and rated. Significant differences were found in the development of cognition and attention in the 1-, 3-, and 5-yr-old children of psychotic mothers, compared with the children of nonpsychiatric mothers. No differences were found in the 6-yr-old children or between sexes. CPT omission scores of psychotic mothers and sons were significantly correlated, but not those of mothers and daughters. CPT commission errors were uncorrelated for both sons and daughters. Field independence-dependence scores were highly correlated for psychotic mothers and daughters, but not for mothers and sons. There were no significant correlations for control mothers and their children. Children of schizophrenic mothers appear especially vulnerable to attentional deficits.—*L. Gorsey.*

817. Guilford, Joan S. (Sheridan Psychological Services, Beverly Hills, CA) **Maturation of values in young children.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 241-248.—Compared 611 1st, 2nd, and 3rd graders in 1 sample on the basis of differences between factor scores on the original form of the Values Inventory for Children (VIC). A 2nd sample of 1,167 1st, 2nd, 3rd, and 4th graders was administered the revised VIC, and factor score differences were tested for significance. As Ss matured, they became less selfish and domineering, less approving of asocial behaviors, and more inclined to value large numbers of friends. There was some evidence that Ss valued academic matters less as they matured. (15 ref)—*Journal abstract.*

818. Halverson, Charles F. & Waldrop, Mary F. (National Inst. of Mental Health, Child Research Branch, Bethesda, Md.) **The relations of mechanically recorded activity level to varieties of preschool play behavior.** *Child Development*, 1973(Sep), Vol. 44(3), 678-681.—Reported relations between data from a simple and reliable activity recorder, O data of vigorous play in outdoor and indoor settings, and teachers' ratings of 58 2½-yr-old children. The recorder consists of 3 small manual wristwatches placed in a small packet so that each watch records movement in 1 of 3 dimensions (horizontal, vertical, or lateral). Any movement across 1 dimension results in a movement of the sweep-hand of the appropriate watch. Data from the recorder were highly related to other objective data for both sexes outdoors, but only males showed generality of play

across situations. Recorder data showed males more active than females and were related to nearly all teachers' ratings for both sexes. (15 ref)—*Journal abstract.*

819. Henry, Frances P. (United States International U.) **Effect of reinforcement conditions on a discrimination learning task for impulsive versus reflective children.** *Child Development*, 1973(Sep), Vol. 44(3), 657-660.—Assigned 90 male 1st graders, identified as either reflective or impulsive on the Matching Familiar Figures Test, to 1 of 6 reward conditions in a discrimination learning task. The conditions were verbal reward, verbal punishment, verbal reward plus punishment, nonverbal reward, nonverbal punishment, nonverbal reward plus punishment. Overall, reflective Ss showed the best performances. For all groups performances were poorest under reward conditions and better under the punishment and reward plus punishment conditions. Neither reinforcement type nor reinforcement combination appeared to be related to the response style of the child.—*Journal abstract.*

820. Ingram, Eben & Fitzgerald, Hiram E. (Michigan State U) **Individual differences in infant orienting and autonomic conditioning.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 359-367.—Attempted, and subsequently demonstrated, conditioned discrimination and discrimination reversal of the skin potential response in 12 84-135 day old infants. Analysis of individual S data indicates individual differences in conditionability, as well as a significant relation between orienting response magnitude and conditionability. In general, high-magnitude orienters discriminated; low-magnitude orienters did not. Behavioral ratings of state, sex of S, and stimulus order were not related to orienting or to conditionability. (22 ref)—*Journal abstract.*

821. Israel, Allen C. & O'Leary, K. Daniel. (State U New York, Albany) **Developing correspondence between children's words and deeds.** *Child Development*, 1973(Sep), Vol 44(3), 575-581.—32 preschool children in a free-play situation experienced 1 of 2 training sequences: saying then doing or doing then saying. The effect of these training sequences on the development of a correspondence between children's verbal and nonverbal behaviors was examined in 2 experiments. Increases in correspondence were a function of the reinforcement contingency and the sequence of behaviors. Reinforcers contingent upon verbal behavior were not sufficient to produce increases in both verbal and nonverbal behaviors (correspondence). Increased correspondence occurred when reinforcers were contingent upon both behaviors and with a say-do sequence. The do-say sequence produced high levels of correspondence only after previous say-do training. Exp II examined the effects of reinforcing the 2 sequences without a portion of the training procedures included in Exp I. Again the say-do sequence produced higher levels of correspondence.—*Journal abstract.*

822. Kearsley, Richard B. (Tremont Street Infant Ctr, Boston, MA) **The newborn's response to auditory stimulation: A demonstration of orienting and defensive behavior.** *Child Development*, 1973(Sep), Vol 44(3), 582-591.—Exposed 48 normal newborns to simple and complex sounds controlled for intensity, frequency, and

rise time. Eye opening followed prolonged rates of onset, and eye closing followed rapidly onsetting signals. Maximum cardiac deceleration occurred to frequencies of 500 and 2,000 cps; maximum cardiac acceleration to frequencies of 1,000 cps. Signals producing maximum deceleration were accompanied by eye opening and reduced head movement; those followed by maximum acceleration produced eye closing and increased head movement. Specific combinations of intensity and rise time when applied to particular frequencies appeared to be optimal stimuli for evoking orienting and defensive behavior. (15 ref)—*Journal abstract*.

823. LaVoie, Joseph C. (U Nebraska, Omaha) **The effects of an aversive stimulus, a rationale, and sex of child on punishment effectiveness and generalization.** *Child Development*, 1973(Sep), Vol 44(3), 505-510.—Investigated punisher effectiveness and generalization of an aversive stimulus, a rationale, and a combination of the 2 in a laboratory analog designed for punishment research, with 80 1st- and 2nd-grade boys and girls. 3 factors assumed to influence punishment—sex of child, an aversive stimulus, and a rationale—were combined in a  $2 \times 2 \times 2$  factorial design, with a female serving as the punitive agent. Significantly greater suppression of deviant behavior and punishment generalization occurred when the punisher consisted of an aversive stimulus. Use of a rationale resulted in discrimination rather than punishment generalization. Punishment was more effective with girls than boys.—*Journal abstract*.

824. Lee, David N. & Aronson, Eric. (U Edinburgh, Scotland) **Visual proprioceptive control of standing in human infants.** *Perception & Psychophysics*, 1974(Jun), Vol 15(3), 529-532.—Conducted an experiment in which 7 normal 13-16 mo old infants learning to stand were caused to sway and even to fall backward or forward in response to appropriate visual stimulation. Results show that the Ss used visual proprioceptive information about body sway in order to maintain stable posture. Moreover, the visual proprioceptive information was more potent than the nonvisual.—*Journal abstract*.

825. Maratsos, Michael P. (U Minnesota, Inst of Child Development) **Nonegocentric communication abilities in preschool children.** *Child Development*, 1973(Sep), Vol 44(3), 697-700.—Administered a simple referential communication task to 24 3-5 yr olds. Each S communicated either to an E who apparently could not see the referents that S was referring to or to an E who could see the referents. The Ss communicating to an apparently blind E were far more explicit verbally than those communicating to an E who could see.—*Journal abstract*.

826. Parker, Ronald K. & Rugel, Robert P. (Graduate Center, City U. New York) **The conditioning and reversal of reward value.** *Child Development*, 1973(Sep), Vol. 44(3), 666-669.—Investigated the degree to which counterconditioning could alter the positive or negative value acquired by a neutral stimulus in a conditioning situation with 56 8-9 yr olds. Neutral stimuli were paired with either winning \$.02, losing \$.01, or no consequences in a conditioning game. After 3 sessions of the game, the positive and negative consequences were reversed, and 5 additional sessions were conducted. A verbal evaluation measure revealed significant positive and negative

conditioning and counterconditioning effects, while a reward expectancy measure showed significant positive, but not negative, conditioning and counterconditioning effects. The dependent measures used to assess the effects of conditioning had no independent effect on subsequent evaluations of the once neutral stimuli.—*Journal abstract*.

827. Pomerleau-Malcuit, Andrée & Clifton, Rachel K. (U Quebec, National Inst of Scientific Research, Quebec, Canada) **Neonatal heart-rate response to tactile, auditory, and vestibular stimulation in different states.** *Child Development*, 1973(Sep), Vol 44(3), 485-496.—Analyzed newborn cardiac activity in the context of the orienting response. Stimuli in 3 modalities were presented to 46 newborn infants in different states: before and after a feeding, while sleeping and awake. Each S received 3 trials of tactile, vestibular, and auditory stimulation. Statistical analyses were performed on heart rate (HR) during each of the 10 sec of stimulation. In sleeping Ss, the HR response was primarily accelerative to tactile and vestibular stimulation but unreliable to auditory stimulation. For the awake Ss, the feeding variable affected Ss' responsivity to auditory and vestibular stimuli. Before feeding, awake Ss decelerated to both types of stimuli. After feeding, there was no reliable response to any stimulus. A decelerative response was also found to vestibular stimulation in sleeping babies tested before feeding, but only when this type of stimulus was presented first in the sequence. In general, newborns tended to respond with less variability when tested before feeding. (41 ref)—*Journal abstract*.

828. Ratliff, Richard G. & Root, Jeffrey R. (U Colorado) **Two-choice discrimination learning in children as a joint function of incentive level and punishment.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 249-257.—Ran 65 male 4th and 5th graders in a 2-choice discrimination learning task for punishment, high- or low-value reinforcement, or the combination of punishment with high- or low-value reinforcement. A significant main effect of Reinforcement revealed that only Ss in the punishment group showed significant evidence of learning. Results are discussed as possibly being due to the distraction caused by tangible reinforcement, although an alternative explanation was offered on the basis of previous findings that males perform better for punishment than for reward. (18 ref)—*Journal abstract*.

829. Schloon, Marje; Shelhorn, Brigitte & Flehmig, Inge. (U. Hamburg, Psychological Inst., W. Germany) **[Reliability of the Denver development test.]** (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol. 6(1), 39-50.—Tested the reliability of the German version of the Denver Developmental Screening Test (DDST) in 3 groups of 30 children each aged 6 mo, 18 mo, and 3 yrs. Ss were retested 1 wk later. The test reliabilities calculated from developmental ages were .66 for the 6-mo-old group, .82 for the 18-mo-old group, and .83 for the 3-yr-old group. Possible interpretations for the low value of the test reliability in the 6 mo olds are discussed. The item reliabilities, calculated from the raw values, showed median values between .80-1.0. Results are compared with those obtained in Hamburg.

Germany and in Denver, Colorado. The best test-retest reliabilities were found for 3 yr olds. From the compared items, about  $\frac{1}{2}$  showed high or low agreement in both studies. It is concluded that the German version of the DDST is usable as a screening test from the aspect of its reliability with some corrections in regard to the scoring objectivity.—*English summary.*

830. Siegel, Alexander W.; Kirasic, Kathleen C. & Kilburg, Richard R. (U Pittsburgh) **Recognition memory in reflective and impulsive preschool children.** *Child Development*, 1973(Sep), Vol. 44(3), 651-656.—Tested 16 reflective and 8 impulsive black preschool children (identified by the Kansas Reflection-Impulsivity Scale) in a forced-choice recognition memory task. The possibility that correct responses could be made on the basis of verbal labels, purely visual feature analyses, or both was systematically varied. Reflective Ss made more correct recognition choices than did impulsive Ss under all conditions. The order of condition difficulty indicated that both verbal labeling and visual feature analysis, independent of verbal processes, were responsible for successful recognition performance in these Ss.—*Journal abstract.*

831. Sigman, Marian; Kopp, Claire B.; Parmelee, Arthur H. & Jeffrey, Wendell E. (U California, Los Angeles) **Visual attention and neurological organization in neonates.** *Child Development*, 1973(Sep), Vol. 44(3), 461-466.—Administered a neurological examination (e.g., assessments of reflex patterns, muscle tone, and arousal) and a measure of visual attentiveness to 25 24-48 hr old infants. Scores on the neurological examination were significantly related to the length of the 1st fixation of each stimulus and the total length of fixation of the 1st stimulus. The alterability of the baby's state during the neurological examination was also correlated with visual alertness. It is suggested that Ss who complete testing in newborn attention studies may comprise a highly selected sample of neonates.—*Journal abstract.*

832. Surwillo, Walter W. (U Louisville, Medical School) **Speed of movement in relation to period of the electroencephalogram in normal children.** *Psychophysiology*, 1974(Jul), Vol. 11(4), 491-496.—Investigated movement time (MT) and simple reaction time (RT) in relation to period of the EEG in a group of 17 healthy male 8-17 yr old Ss. MT and RT were measured by means of a modified version of the dart-throwing game in which S thrust his arm and forefinger forward, as quickly as possible, at a target located 28 cm away. Statistically significant negative correlations between RT and age and between MT and age confirmed previous reports that younger children not only take more time to initiate a response than older children but also move more slowly. RT was positively correlated with EEG period, but MT and EEG period were not related. Findings suggest that while MT and RT in children appear to run similar developmental courses, the speeds of initiation and of execution of a response are not determined by the same processes. (27 ref)—*Journal abstract.*

833. Tizard, Jack. (U London, Inst of Education, Thomas Coram Research Unit, England) **The upbringing of other people's children: Implications of research**

and for research. *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Jul), Vol. 15(3), 161-173.—Suggests that the variety of provision for deprived and handicapped children offers rich material for research into factors affecting the functioning of complex organizations and into environmental factors affecting child development. Recent studies have shown significant associations between aspects of the formal organizational structure of institutions, staff child-care practices, and the behavior of the children. (38 ref)

834. Walls, Richard T. (West Virginia U.) **Delay of reinforcement development.** *Child Development*, 1973(Sep), Vol. 44(3), 689-692.—146 preschool, 3rd-, and 6th-grade children classified as socioeconomically disadvantaged or nondisadvantaged were Ss in a voluntary-delay-of-reinforcement paradigm. Following the 1st day's "work" session, Ss were given the option of selecting a toy costing 3 tokens then and paying the remaining 2 tokens when they had earned them or waiting until they had saved up enough to buy the toy. Results indicate a shift from preference for immediate reinforcement in preschool to deferred selection in 6th grade for both socioeconomic groups. Relations between the present 1:1 value ratio and the ratio of  $< 1$  represented by traditional delay-of-gratification investigations are discussed.—*Journal abstract.*

835. Warga, Richard G. (Bucks County Community Coll) **Personal awareness: A psychology of adjustment.** Atlanta, GA: Houghton Mifflin, 1974. xi, 546 p. \$10.95.—Presents a textbook which offers an exploratory course in personality applied psychology, from both preventive and corrective viewpoints. Among the topics included are adjustment and motivation, personality, social interaction, perception and emotions, abnormal behavior and behavior modification, sex, drugs, alienation, and suicide.

836. Werner, Emmy E. (U California, Davis) **From birth to latency: Behavioral differences in a multiracial group of twins.** *Child Development*, 1973(Sep), Vol. 44(3), 438-444.—Reports intrapair differences in a multiracial group of 12 twin pairs, from the cohort of 1955-1957 births on the island of Kauai, Hawaii, on infant behavior ratings and cognitive skills in early and middle childhood. Among discordant twins, both monozygotic and dizygotic, the second-born had experienced more adverse perinatal events than the firstborn. Birth sequence differentiated more among discordant twins than birth weight, favoring the firstborn on maternal ratings of activity in the 1st yr, Cattell Infant Intelligence Scale IQ at age 2, Primary Mental Abilities reasoning factor, visual-motor development, and school achievement at age 10. Intrapair differences in activity level, Sociability, and temper at age 1 persisted and were related to cognitive skills at ages 2 and 10. (21 ref)—*Journal abstract.*

837. Wetherford, Margaret J. & Cohen, Leslie B. (U Illinois, Children's Research Ctr) **Developmental changes in infant visual preferences for novelty and familiarity.** *Child Development*, 1973(Sep), Vol. 44(3), 416-424.—Examined infant preferences for novel and familiar visual stimuli in 2 experiments. In both, infants were repeatedly shown 1 pattern with novel patterns interspersed at 3 intervals in the familiarization series. In

Exp I. 54 infants 6-12 wks of age were examined both longitudinally and cross-sectionally. Exp II was a partial replication of Exp I with 16 6-8 wk olds. Habituation to the familiar pattern occurred at 10-12 wks but not at 6-8 wks. Older Ss also preferred novel patterns, while younger Ss preferred familiar ones. Results from the cross-sectional design are clearer than from the longitudinal design. Findings support J. Hunt's 1963 2-stage model of infant preferences. (19 ref)—*Journal abstract*.

838. Williams, Joyce W. & Smith, Marjorie. (Florida State U) **Middle childhood: Behavior and development.** New York, NY: Macmillan, 1974. xv, 492 p.—Presents a review of recent research on physical, mental, social, and emotional development during ages 5-12 and how these types of growth influence behavior and interpersonal relationships. Topics include the effects of the cultural milieu, the family, school, peer activities, and religion on development, how children think, and the child as a consumer. (19 p ref)

839. Zelniker, Tamar & Oppenheimer, Louis. (Tel-Aviv U, Ramat-Aviv, Israel) **Modification of information processing of impulsive children.** *Child Development*, 1973(Sep), Vol 44(3), 445-450.—Investigated the effect of different training methods on perceptual learning of 60 5-6 yr old impulsive children (identified by the Matching Familiar Figures Test). 2 training methods were used: a matching to sample method (M) and a differentiation method (D). The M training required Ss to select from a set of stimuli those that were exactly the same as a standard figure, whereas the D training required Ss to find those figures that were different from the standard. Training was followed by a transfer test to assess different types of information-processing techniques: (a) distinctive features, (b) prototype, and (c) control. Results of the transfer test show that of the D subgroups, the distinctive-features group was superior to the other 2 groups, which were not significantly different from each other. No significant differences were found among the M subgroups on the transfer test. Data indicate that Ss that had received the D training learned to process, primarily, features distinguishing among the stimuli, whereas Ss that had received the M training did not show a preference for a particular mode of perceptual learning.—*Journal abstract*.

### Cognitive & Physical Development

840. Brucefors, Agneta et al. (U Lund, Sweden) **Trends in development of abilities related to somatic growth.** *Human Development*, 1974, Vol 17(2), 152-159.—Selected and compared, from a longitudinal sample of 202 children studied from birth to 8 yrs of age, a group with more rapid development than normal and one with a slower development. A relationship between the development of abilities and weight and height increases was found for boys aged 4 wks to 2 yrs and between the development of abilities and height increase for girls aged 2-8 yrs.

841. Auzias, Marguerite. (National Inst of Health & Medical Research, Alfred Binet Ctr., Paris, France) **[Plasticity in linear movement of children who write with their left hand.]** (Fren) *Revue de Psychologie Appliquée*, 1974, Vol 24(1), 1-30.—Reports on how children who write with their left hand adapt themselves

to conventional left-to-right movement and succeed in writing as fast as children who write with their right hand. Test results of 5-11 yr old left-handers show that their spontaneous patterns of activity can be easily reorganized.—*K. J. Hartman*.

842. Ayers, Jerry B.; Rohr, Michael E. & Ayers, Mary N. (Tennessee Technological U) **Perceptual-motor skills, ability to conserve, and school readiness.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 491-494.—Attempted to determine the relationship of perceptual-motor skills and ability to conserve to school readiness. 94 Ss in kindergarten and 1st grade were administered the Purdue Perceptual-Motor Survey, the Metropolitan Readiness Test, and 6 Piaget tasks to measure logical thinking. Scores on the Purdue scale and Piaget tasks were not correlated; however, both sets of scores were moderately correlated with school readiness as measured by the Metropolitan test.—*Journal abstract*.

843. Blaler, Irv; Doll, Lynda & Winsberg, Bertrand G. (New York State Dept of Mental Hygiene, Child Psychiatric Evaluation Research Unit, NY) **A modified Lincoln-Oseretsky Motor Development Scale: Provisional standardization.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 599-614.—Describes modification of the Lincoln-Oseretsky (L-O) Motor Development Scale into a brief instrument which would be easy to administer and score and which would yield a set of norms against which to assess motor development/proficiency in deviant children of elementary school age. An earlier 31-item modification of the L-O, administered to 210 5-11 yr old normal boys, led to the provisional standardization of a modified scale (ML-O) of 26 items, arranged in approximate order of difficulty and dependence. The scale (a) reflected the developmental nature of motor proficiency, (b) demonstrated acceptable reliability and validity, and (c) required a total administration time of under 30 min. This provisional standardization yielded tentative age and percentile norms. Ongoing validation studies indicate that the modified scale discriminates between clinical populations and the normative group and could help to identify neuromotor deviation among children. (41 ref)—*Journal abstract*.

844. Bird, J. Elizabeth & Bennett, Adrienne F. (Macquarie U, North Ryde, NSW, Australia) **A developmental study of recognition of pictures and nouns.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 117-126.—Gave 20 children at each of 4 age levels (4, 6, 8, and 10 yrs) continuous recognition tasks using concrete noun, abstract noun, and pictorial stimuli in a 4 × 3 factorial design. Pictures were recognized significantly better than concrete and abstract nouns at the 4- and 6-yr age levels and significantly better than abstract nouns at the 8- and 10-yr age levels. There were no significant differences between recognition of concrete and abstract nouns at any age level, which opposed the findings from adult studies. Recognition for both concrete and abstract nouns was linear and increased significantly with age, but no age trends for picture recognition were found. (33 ref)—*Journal abstract*.

845. Bloom, Lois; Hood, Lois & Lightbown, Patsy. (Teachers Coll, Columbia U) **Imitation in language development: If, when, and why.** *Cognitive Psychology*, 1974(Jul), Vol 6(3), 380-420.—To explore the function of

imitation for first-language learning, imitative and spontaneous utterances were compared in the naturalistic speech of 6 children during the ages of 18-25 mo as they progressed from single-word utterances (when mean length of utterance was essentially 1.0) to the emergence of grammar (when mean length of utterance approached 2.0). The relative extent of imitation, and lexical and grammatical variation in imitative and spontaneous speech, were determined. There were inter-S differences in the extent of imitation, but each S was consistent in the tendency to imitate or not to imitate across time. For those Ss who imitated, there were both lexical and grammatical differences in imitative and spontaneous speech, and a developmental shift from imitative to spontaneous use of particular words and semantic-syntactic relations between words. Results are discussed as evidence of an active processing of model utterances relative to the contexts in which they occur for information for language learning. (44 ref)—*Journal abstract*.

846. Bogard, Dolores A. (State University Coll New York, Cortland) **Visual perception of static and dynamic two-dimensional objects.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 395-398.—Investigated differences between visual perception of static (nonmoving) and dynamic (moving) 2-dimensional objects at several ages. The ability of 4 age groups (6-7, 11-13, 18-22, and 66-79 yrs) to perceive figure-ground was assessed. A total of 129 Ss were tested. A test of visual perception of figure-ground was selected and adapted to a dynamic condition. Results show a significant difference between performance on the static and dynamic tests of visual perception across all age levels, with fewer errors made on the dynamic test. There was a significant difference in performance between ages. It is concluded that there is a difference between static and dynamic visual perception of figure-ground at the ages studied and that perception of figure-ground tends to improve with age.—*Journal abstract*.

847. Chovan, William L. (Western Carolina U) **Some observations of two culturally different groups of children on memory and coordination tasks.** *Western Carolina University Journal of Education*, 1973(Fal), Vol 5(2), 19-24.—Administered Recall and Motor Coordination scales of the Kahn Intelligence Tests to 30 6-yr-old children, of whom 15 were supported by Aid to Dependent Children (ADC) and 15 had parents at managerial level (FSS). No significant differences on recall and motor coordination were found between ADC and FSS Ss. (17 ref)—*J. Joesting*.

848. Clark, Eve V. (Stanford U) **Non-linguistic strategies and the acquisition of word meanings.** *Cognition*, 1973, Vol 2(2), 161-182.—Proposes that children's apparent comprehension of certain words is at 1st dependent on a combination of their linguistic hypotheses about a word's meaning and certain nonlinguistic strategies. 70 1½-5 yr olds were given instructions requiring comprehension of the locative terms "in," "on," and "under." Results show that Ss went through 3 stages: (a) they consistently used certain nonlinguistic strategies characterized by 2 ordered rules, (b) they applied these rules to only 1 or 2 of the locative instructions, and (c) they exhibited full semantic knowl-

edge of the 3 word meanings. Because of these nonlinguistic strategies, the younger Ss always appeared to understand "in" correctly, sometimes appeared to understand "on," and never understand "under." It is argued, nevertheless, that these nonlinguistic strategies determine the order of acquisition of the 3 locative terms. (French summary) (23 ref)—*Journal abstract*.

849. Cornell, Edward H. (Albert Einstein Coll of Medicine, Yeshiva U) **Infants' discrimination of photographs of faces following redundant presentations.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 98-106.—Used infants' discrimination of photographs of faces, as indicated by fixation toward novel targets, as the criterion to evaluate familiarization conditions designed to facilitate the exercise of selective attention. Groups of 128 19- and 23-wk-old infants were shown either pictures of different faces of the same sex, differing poses of the same face, or repeated exposures of the face that served as a test stimulus. The older infants demonstrated differential attention to novel over familiar stimuli during subsequent recognition tests, and an examination of their responsiveness during familiarization presentations indicated differing trends of looking activity.—*Journal abstract*.

850. Cuvo, Anthony J. (Southern Illinois U, Rehabilitation Inst) **Incentive level influence on overt rehearsal and free recall as a function of age.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 167-181.—Conducted 2 studies to test incentive magnitude effects on free recall. Exp I examined whether 2 incentive levels would differentially influence rehearsal of words paired with the incentive values. 5th and 8th graders and college adults were tested in conditions in which they were instructed to (a) do all rehearsal overtly or (b) engage in a counting task subsequent to item presentation and refrain from overt and covert rehearsal. College Ss rehearsed and recalled significantly more \$.10 than \$.01 words. 8th graders tended to favor \$.10 items in recall and rehearsal, but the differences were of questionable reliability. 5th graders failed to produce reliable incentive level effects. Exp II showed that 5th graders, as well as older Ss, recalled more high-incentive words under standard free-recall instructions in which rehearsal was presumed to be covert. Results support theories emphasizing rehearsal as a mediator of incentive level effects on learning.—*Journal abstract*.

851. Davis, Albert J. & Lange, Garrett. (Vassar Coll.) **Parent-child communication and the development of categorization styles in preschool children.** *Child Development*, 1973(Sep), Vol. 44(3), 624-629.—Examined linguistic communication styles of 56 parents in interaction with their preschool children in storytelling and block-sorting tasks and the relationships between these styles and children's categorization style preferences. Children's categorization style preferences were assessed using I. Sigel's Styles of Categorization Test. Parents conveyed proportionately more relational-contextual messages in both tasks, with descriptive messages increasing and categorical-inferential messages decreasing from the storytelling to the more structured block-sorting task. Correlational analyses pointed to the mother-father unit, rather than either parent considered singly, as a socializing agent for the development of

descriptive categorizing styles in young children.  
—*Journal abstract.*

852. Denney, Douglas R. (U. Kansas) **Reflection and impulsivity as determinants of conceptual strategy.** *Child Development*, 1973(Sep), Vol. 44(3), 614-623.—Instructed 64 7-8 yr old reflective and impulsive children (identified by the Matching Familiar Figures Test) to hasten or delay their responses on a test of hypothesis-seeking and constraint-seeking conceptual strategies (20 questions procedure). Latency of response data on pre-, training, and immediate posttests showed that the attempts to hasten or delay responses were successful in changing response latencies. Furthermore, Ss who were instructed to hasten their responses increased their use of hypothesis-seeking strategies; Ss who were instructed to delay their responses did not change their strategy. Results are interpreted in terms of S. White's temporal stacking model. Data indicate that cognitive tempo may be one factor, though by no means an exclusive one, underlying conceptual strategy. (21 ref)—*Journal abstract.*

853. Drummond, Thomas B.; Williams, Tannis M. & Aiken, Leona S. (Catholic U. of America) **Children's use of prototypes in pattern classification.** *Child Development*, 1973(Sep), Vol. 44(3), 686-688.—In a schematic concept formation task, 30 2nd and 5th graders were required to sort 60 computer-generated, 8-sided polygons into their 2 classes. In sorting each pattern the child could ask to see either of the 2 class prototypes, both, or neither. Use of the 4 possible prototype information strategies did not vary with age, but 5th graders were significantly more accurate than 2nd graders. Results indicate that age differences in schematic concept formation are due more to the efficiency of information use than to differences in strategy or the selection of information to be used.—*Journal abstract.*

854. Elkind, David. (U Rochester) **Infant intelligence.** *Australian Journal of Mental Retardation*, 1974(Mar), Vol 3(1), 6-8.—Discusses the implications of M. Lewis and H. McGurk's findings (see PA, Vol 50:725) concerning the lack of reliability and validity of infant intelligence tests (e.g., the Bayley Scales of Infant Development). It is suggested that the findings demonstrate the inutility of programs which assess the effects of "infant stimulation," since what is being "stimulated" are the same sensorimotor skills which appear in infant intelligence scales. Discontinuities between infant and later intelligence scores raise questions as to the genetic origin of intelligence and its stability over time. It is concluded that intelligence should be considered in dynamic biological terms as an evolving organ system, rather than in static psychometric terms.—A. Olson.

855. Fagan, Thomas J. & Schulman, Allan H. (Virginia Polytechnic Inst. & State U.) **The effects of conceptual training on reversal shift performance of young children.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 39-41.—Studied the relationship between conceptual training (analytic vs nonanalytic) and performance on a reversal shift task in 45 white, middle-class children from each of 4-, 6-, and 8-yr-old age groups. Results reveal that (a) with increasing age, reversal shift performance improved; (b) only 6-yr-old Ss showed a stable conceptual style; and (c) while both types of

training enhanced reversal performance, analytic training resulted in greater facilitation of reversal shift learning. It is concluded that conceptual training channels an S's attention upon the relevant dimensions of the shift task.—*Journal abstract.*

856. Ford, Mary A.; Stern, Daniel N. & Dillon, Donald J. (Coll of Mt St Vincent) **Performance of children ages 3 to 5 on the Draw-a-Person Task: Sex differences.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1188.—Data from 29 female and 29 male middle-class 3-5 yr olds show that girls performed at a significantly more advanced level in respect to detailing and body concept development on the Draw-A-Person Test.

857. Furth, Hans G. & Milgram, Norman A. (Catholic U of America, Ctr for Research in Thinking & Language) **Labeling and grouping effects in the recall of pictures by children.** *Child Development*, 1973(Sep), Vol 44(3), 511-518.—Studied free recall of an array of pictures followed by sequential location recall in 256 4-12 yr olds under 4 main presentation conditions—arrays of pictures differing in salience of categories (contiguous, systematic, random grouping of category instances) vs noncategorical (control) array—and 2 task conditions, overt labeling vs pointing. Successive vs simultaneous presentation was also studied. Grouping effects on memory were systematically related to salience of grouping and to age. 2 labeling effects on memory performance were observed: (a) a direct primary effect at all ages that facilitated attention to the static configuration of all memory items and (b) an indirect developmental effect of organizing that aided the discovery of categories under specific grouping and age conditions. The direct effect was observed mainly on location recall, while the development effect was observed on free recall trials.—*Journal abstract.*

858. Goldstein, Steven G. & Braun, Lisa S. (U Vermont) **Reversal of expected transfer as a function of increased age.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1139-1145.—Investigated the relationship between aging and performance on a simple and a complex bilateral motor task. 209 Ss were divided into 6 age groups (20-29, 30-39, 40-49, 50-59, 60-69, and 70-79 yrs) and given the Finger Oscillation and Tactual Performance tests from the Halstead Impairment Index. Results show a systematic and accelerating increase in the proportion of reversals on tactual performance as a partial function of age; however, this was not the case for the Finger Oscillation test where the proportion of reversals for the older Ss (60-69 yrs) were no greater than the proportion for the youngest Ss. It is suggested that the transfer mechanism deteriorates with increasing age at a faster rate than the simple motor functions represented by the Finger Oscillation test. (18 ref)—L. Gorsey.

859. Hale, Gordon A. & Taweel, Suzanne S. (Educational Testing Service, Princeton, NJ) **Age differences in children's performance on measures of component selection and incidental learning.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 107-116.—Administered 1 of 3 learning tasks—a component selection problem, in which the 2 components of the stimuli were redundant and could both serve as functional cues, and 2 incidental learning tasks, in which 1

stimulus component was task-relevant and the other was incidental—to 149 5- and 147 8-yr-olds. A posttest, measuring the children's recall for information about each component separately, was assumed to reflect the degree of attention directed to each component during learning. Attention to the nondominant component increased with age when this feature was redundant with the dominant component but not when it was incidental. Results suggest a developmental improvement in the flexibility of attention deployment; as children grow older they tend increasingly to differentiate between situations in which it is useful to attend to several stimulus features and situations in which it is more advantageous to attend selectively.—*Journal abstract.*

860. Hedrick, Dona L. & Kunze, LuVern H. (U Washington, Child Development & Mental Retardation Ctr) **Diotic listening in young children.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 591-598.—Gave a diotic competing message task to 120 children, preschool through 3rd grade. The competing auditory messages were prerecorded and presented free field via loudspeaker. The messages consisted of a signal message and a distraction message, varied systematically in relative intensity and content. Results indicate that errors on the competing message task varied inversely with age, increased with changes toward more unfavorable signal to distraction levels for the younger Ss, and were directly influenced by the content of the distraction message for all ages. (15 ref)—*Journal abstract.*

861. Hogan, Robert. (Johns Hopkins U) **Dialectical aspects of moral development.** *Human Development*, 1974, Vol 17(2), 107-117.—Defines the concept of the dialectic and places it within the context of a well-defined methodology—organicism—which contrasts markedly with the logical empiricism of much contemporary psychology. The relevance of a dialectical perspective for developmental psychology is demonstrated in 2 ways. First, 3 standard models of moral development (namely those proposed by Freud, G. H. Mead, and Piaget) are summarized, using the definition of the dialectic developed here. Second, an alternative viewpoint on moralization is outlined which attempts systematically to incorporate a dialectical perspective. An irony implicit in the study of moral development is noted: that a viable society may need its immoralists.—*Journal abstract.*

862. Hollos, Marida & Cowan, Philip A. (U. Oslo, Norway) **Social isolation and cognitive development: Logical operations and role-taking abilities in three Norwegian social settings.** *Child Development*, 1973(Sep), Vol. 44(3), 630-641.—Administered 9 measures of conservation, classification, and role taking to 48 7-9 yr olds in each of 3 social settings in rural Norway—a farm community, a village, and a town. The primary difference among the 3 samples was the amount of verbal and social interaction which the children engaged in with parents and peers. Factor analysis yielded 2 main factors—a logical operations factor involving all classification and conservation tests and a role-taking factor involving all multiple perspective and communications tests. Age effects were prominent in logical operations, while setting effects predominated in role taking. Farm children, the most socially isolated,

received relatively low scores on role-taking tasks, but performed as well or better than village and town children on logical operations. Contrary to J. S. Bruner's hypothesis, language stimulation and schooling do not seem to play a major role in the development of logical operations. (25 ref)—*Journal abstract.*

863. Hutson, Barbara A. & Powers, James. (State U New York, Albany) **Reversing irreversible sentences: Semantic and syntactic factors.** *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 99-110.—Presented active and passive sentences with probable and improbable semantic content to 100 1st graders and 100 kindergartners. An "irreversible" sentence was considered probable and its reverse was considered improbable. In a design employing syntax, probability, grade, and sex as factors, probability and syntax were found to be significant both as main effects and in their interaction. Probability had little effect on the comprehension of active sentences, but strongly affected comprehension of passive sentences. 1st graders responded correctly more often than kindergartners; the difference was greatest on improbable sentences, with improbable passive sentences the most difficult. Sex differences were not found. The greater difficulty in comprehending less familiar sentences when syntactic form is not supported by semantic content suggests that the semantic component of grammar may play an important role in the child's acquisition of syntactic comprehension.—*Journal abstract.*

864. Huttenlocher, Janelle. (Teachers Coll, Columbia U) **The origins of language comprehension.** In R. L. Solso (Ed), *Theories in cognitive psychology: The Loyola Symposium*. Potomac, MD: Lawrence Erlbaum, 1974, ix, 386 p. \$14.95.—Presents pilot data from a longitudinal investigation of receptive language development (i.e., the first stages in systematic responses to word sounds) in 3 10-18 mo old children. Data suggest that receptive language precedes productive language, that there is not a simple relation between the child's response to words and his production of words, and that there is a progression in the type of response the child makes to words in the period before he speaks. Overall aspects of the children's behavior (e.g., attention), methodological issues, and sample protocols are described. (30 ref)

865. Jordan, Brian T. & Jordan, Susan G. (Highlands Mental Health Ctr, Sebring, FL) **Jordan Left-Right Reversal Test: A study of visual reversals in children.** *Child Psychiatry & Human Development*, 1974(Spr), Vol 4(3), 178-187.—Developed the Jordan Left-Right Reversal Test to standardize a measure for symbol reversals (letters and numbers) in normal 6-10 yr old children. A random sample of 2,500 Ss was tested in schools in 6 different states. Results established age-sex norms for symbol reversals. Error scores were inversely related to age and were generally lower for girls. Younger children (6-8.5) made significantly more number reversals than letter reversals. Boys in this age group made the highest percentage of number errors. Administration of the test to a sample of Ss with minimal brain dysfunction indicated that the test has adequate discrimination ability and suggests that visual reversals are a symptom of this childhood disorder. (15 ref)—*Journal abstract.*

866. Kohen-Raz, Reuven. (Hebrew U, Jerusalem, Israel) **Physiological maturation and mental growth at**

**pre-adolescence and puberty.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Jul), Vol 15(3), 199-213.—Conducted a 2-yr follow-up study with 350 boys and 350 girls of average mental level in grades 5-8 from higher and lower middle-class environments in Israel. In the higher-class group, physiological maturation was related to cognitive variables predominantly at Grades 5-7 in girls and at grades 7-8 in boys (i.e., during the respective physical growth spurts). In the lower-class group the relationship between physiological and intellectual growth was inconsistent. Performance on nonverbal tests correlated higher with physiological growth in boys. Season of birth was an important intervening variable. Results, which are in accordance with findings of a pilot study, demonstrate environmental and possibly genetic differences in relationships between cognitive and physiological maturation, but do not unambiguously confirm the occurrence of a pubertal mental growth spurt. (25 ref)—*Journal summary*.

867. Kurtines, William & Greif, Esther B. (Florida International U) **The development of moral thought: Review and evaluation of Kohlberg's approach.** *Psychological Bulletin*, 1974(Aug), Vol 81(8), 453-470.—Evaluates the evidence supporting L. Kohlberg's theory on the development of moral thought. A systematic review of the literature suggests that there are several conceptual and methodological problems with the approach. The problems include the derivation, administration, and scoring of the model's primary measurement device (Moral Judgment Scale); the lack of evidence for both the reliability and validity of that device; and the absence of direct evidence for the basic assumptions of the theory. It is concluded that the empirical utility of the model has yet to be demonstrated. (40 ref)—*Journal abstract*.

868. Lee, Laura L. (Northwestern U) **Developmental sentence analysis: A grammatical assessment procedure for speech and language clinicians.** Evanston, IL: Northwestern University Press, 1974. xxi, 277 p. \$13.50.—Presents a clinical manual for assessing the grammatical structure of children's spontaneous speech; guidelines for planning effective interventional training in clinical settings are also presented. Also discussed are developmental syntax and morphology, findings from a normative study of 2-6 yr old children, and comparisons of the developmental sentence analysis procedure with other studies of language acquisition. (4% p ref)

869. Lehalle, Henri. (U Rouen, Teaching Research Units, France) **[Genetic constancy of the bond between stability and transitivity of choice.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 101-108.—Presented black-and-white photographs to 58 children in the age groups 5-6 yrs, 8-10 yrs, and 9-10 yrs who were asked their preferences in paired comparisons. Several presentations were made under the same conditions. As previously found, with increased age, intransitivity decreased and stabilization of choice occurred. For all ages, transitive choices corresponded to stable choices, and intransitive choices corresponded to a lack of choice stability. 2 possible interpretations require further testing: (a) With age, the choice situation is more often interpreted as sensation for which the coordination of criteria of choice becomes necessary. (b) When objects

are situated marginally, they become less discriminable.—G. Rubin-Rabson.

870. Longobardi, Ellen T. & Wolff, Peter. (U Wisconsin, Madison) **A comparison of motoric and verbal responses on a Piagetian rate-time task.** *Child Development*, 1973(Sep), Vol 44(3), 433-437.—Attempted to extend Piaget's thoughts on sensory-motor development to the preoperational child's performance of a Piagetian rate-time task. Specifically, the ability to imitate motorically E's performance of the task was compared with the ability to give conceptually correct verbal replies to questions about the task. Ss were 32 nursery school and 32 2nd-grade children. The 2nd-grade Ss were able to imitate a given rate-time relationship whereas their verbal (symbolic) conceptualization remained as inadequate as that of the nursery school Ss, who were unable to imitate these relationships. The differential development of rate-time relationships in the 2 response modes suggests the need for an understanding of the connection between actions which may exist in the absence of any indication of the symbolic understanding of logical or infralogical relations in the child.—*Journal abstract*.

871. Looft, William R. (Pennsylvania State U, Coll of Human Development) **Animistic thought in children: Understanding of "living" across its associated attributes.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 235-240.—Identified 39 2nd graders from an initial pool of 59 Ss as "nonanimistic" according to their classification of 16 objects into "living" and "nonliving" categories. Further analyses of the Ss' generalization responses for the same objects across 3 associated biological criteria—need-for-nutritment, respiration, reproduction—were carried out. It was found that these supposedly "nonanimistic" Ss did not fully grasp the implications of the life concept. A conceptual *horizontal décalage* is suggested, in that the need-for-nutritment concept was better generalized than the respiration concept, and the respiration concept was more accurately generalized than that of reproduction. These attributes were ascribed more accurately to nonliving than to living things.—*Journal abstract*.

872. Lurçat, L. (U René Descartes, Teaching & Research Unit of Educational Science, Paris, France) **[Perception and reproduction of morphological discontinuities.]** (Fren) *Revue de Psychologie Appliquée*, 1974, Vol 24(1), 31-42.—Reports on difficulties of 3-6 yr old children in reproducing 2 right-angled triangles when one is rotated 180°. The visual model permits better success in following orthographic trajectories. The exercises require resolution of contradictions between hand movements and forms.—K. J. Hartman.

873. Macready, Corise & Macready, George B. **Conservation of weight in self, others, and objects.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 372-374.—Found that under analogous transformations 2nd and 3rd graders ( $N = 64$ ) tended to conserve both their own and another person's weight prior to conserving the weight of nonhuman objects (a rubber doll and a piece of clay). Findings suggest that children acquire conservation of weight in a sequential manner, with the type of object used in a conservation

task affecting the time when conservation is first observed.—*Journal abstract.*

874. Maliphant, R.; Supramaniam, S. & Saraga, E. (U Coll, London, England) **Acquiring skill in reading: A review of experimental research.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Jul), Vol 15(3), 175-185.—Examines experimental research concerned with the acquisition of skill in reading, with emphasis on the complex role of perceptual and cognitive processes. It is suggested that experimental studies directed towards an analysis of the task would have 2 major advantages. They would provide both a better understanding of the nature of the process and a more adequate theoretical basis for developing effective remedial measures. (72 ref)—*Journal summary.*

875. McGraw, Kenneth O. & McCullers, John C. (U Oklahoma) **The distracting effect of material reward: An alternative explanation for the superior performance of reward groups in probability learning.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 149-158.—Determined whether the distraction effect associated with material rewards in discrimination learning can account for the superior performance of reward groups in probability learning. The performance of 144 school children (preschool, 2nd, and 5th grades) on a 2-choice successive discrimination task was compared under 3 reinforcement conditions (material reward, marker, and knowledge of results). The 2 events in the task had different frequencies of occurrence, as in probability learning, yet they appeared in a constant order to make 100% payoff possible. Ss in the reward and marker groups learned the task more slowly, and the nonlearners among them used stereotyped alternation patterns to a greater degree than Ss in the knowledge-of-results condition. Findings suggest that a distracting effect of material reward is present in probability learning and may explain the superior performance of reward groups typically found in probability learning studies.—*Journal abstract.*

876. Melnick, Gerald L. (Yeshiva U, Curriculum Research & Development Ctr in Mental Retardation) **A mechanism for transition of concrete to abstract cognitive processes.** *Child Development*, 1973(Sep), Vol 44(3), 599-605.—Proposes an extension of discrimination-learning theory based on the inhibition of stimulus intensity as a mechanism of cognitive development. According to this discrimination-inhibition theory, children experience concrete cues such as form, brightness, etc., with an intensity which captures and holds the orienting response and thereby prevents children from focusing on more abstract stimuli (e.g., cues for number of elements and identity over time). Ss were 48 normal and 37 educable mentally retarded kindergartners and 1st graders. The amount of stimulus distortion in Piaget's conservation-of-number paradigm was varied. Results indicate that the predominant category of transitional children (both normal and retarded) was composed of children who conserved at a low level of stimulus intensity but failed to conserve at a higher level of stimulus intensity ( $p < .01$ ). Data support the discrimination-inhibition theory.—*Journal abstract.*

877. Miller, Patricia H.; Grabowski, Teddy L. & Heldmeyer, Karen H. (U. Michigan) **The role of stimulus**

**dimensions in the conservation of substance.** *Child Development*, 1973(Sep), Vol. 44(3), 646-650.—Examined children's use of length and width dimensions in a conservation of substance task. Data from 84 kindergartners show that nonconservers were selective in their use of dimensions: Ss tended to use length to define amount, while ignoring width, regardless of the extent of the transformations, the order in which they saw the transformations, and whether the transformations were begun again on each trial or continued from trial to trial. Transitional conservers were less likely than nonconservers to always base their nonconservation answers on length. Results contradict Piaget's 4-step equilibrium model of the development of compensation and conservation.—*Journal abstract.*

878. Montgomery, Gary T. & Landers, William F. (Auburn U) **Transmission of risk-taking through modeling at two age levels.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1187-1196.—33 males and 33 females in each of Grades 1 and 5 observed a videotaped model perform on a chance-type risk task and subsequently performed on the task themselves; measures of sex-role development were also taken. While Ss imitated the behavior of the model and the sexes differed substantially on the measures of sex-role, there was no indication of developmental changes in either the performance or imitation of risk-taking. These results support predictions from A. Bandura's social learning theory but did not show risk-taking to be positively associated with sex-role development for Ss of this age, as P. Slovic's 1966 hypothesis might suggest. (20 ref)—*Journal abstract.*

879. Nelson, Keith E. & Earl, Nancy. (Stanford U.) **Information search by preschool children: Induced use of categories and category hierarchies.** *Child Development*, 1973(Sep), Vol. 44(3), 682-685.—Data from 40 4-5 yr olds support the findings of previous studies that 4-6 yr olds in information-seeking games (e.g., 20 Questions) seldom sift alternatives through the use of questions referring to categories. Following pretest trials in a picture-item task, a "category induction" manipulation was used in which items were spatially arranged so that standard categories would be noticeable; Ss were asked to mention any similarities between items during the pretest and learning trials. This manipulation induced children's use of category questions. It is argued that children spontaneously fail to employ task-relevant conceptual abilities because they do not consider that these conceptual abilities will be useful in the solution of the problem.—*Journal abstract.*

880. Nelson, Keith E.; Carskaddon, Gaye & Bonvillian, John D. (Stanford U) **Syntax acquisition: Impact of experimental variation in adult verbal interaction with the child.** *Child Development*, 1973(Sep), Vol 44(3), 497-504.—Reports that 22 sessions of verbal interaction significantly facilitated syntax acquisition by 27 32-40 mo olds. In response to sentences of the child, Es replied with recast sentences that maintained the same basic meaning but provided new syntactic information. Furthermore, a selective bias in these replies, toward use of new predicate information, was matched by selectively stronger facilitation in terms of verb measures.—*Journal abstract.*

881. Nodine, Calvin F. & Simmons, Francine G. (Temple U) **Processing distinctive features in the differentiation of letterlike symbols.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 21-28.—Compared eye movements of a total of 25 kindergarten and 3rd-grade Ss during the differentiation of matched and unmatched pairs of letterlike symbols. The pairs differed on 1 of 4 dichotomous feature dimensions: form, opening, line, and origin. Despite the fact that older Ss required half as many fixations, frames, and cross-comparisons per pair to arrive at the *same-different* judgment than younger Ss, they fixated proportionally more distinctive features (.41) than younger Ss (.36). The greater selectivity and economy in the extraction and processing of information by older Ss is interpreted to be the result of increased cognitive programming of eye movements. Older Ss, because of their familiarity with graphic features, were able to call upon memory for identification and interpretation of visual inputs. Younger Ss relied on a purely perceptual strategy to extract and process graphic information.—*Journal abstract*.

882. Odom, Richard D. & Corbin, David W. (Vanderbilt U) **Perceptual salience and children's multidimensional problem solving.** *Child Development*, 1973(Sep), Vol 44(3), 425-432.—Studied uni- and multi-dimensional processing in 72 6- and 9-yr-old children using recall tasks in which an array of stimuli was reconstructed to match a model array. Hierarchies of perceptual salience were assessed prior to Ss' participation in tasks in which the salience of the relevant dimensions was varied. Results indicate that both age groups were able to solve multidimensional problems but that solution rate was retarded by the unidimensional processing of highly salient dimensions.—*Journal abstract*.

883. Pačesová, Jaroslava. **The development of vocabulary in the child.** Brno, Czechoslovakia: Universita J. E. Purkyně, 1968. 258 p.—Traces the language development of a Czech-speaking boy, recorded from the first utterances of speech until the time when the phonetic realization of different phonemes was stabilized. Each phoneme with its variants is described and charted as to frequency and place of occurrence. (4 p ref)

884. Pasewark, Richard A.; Scherr, Stephen S. & Sawyer, Robert N. (U Wyoming) **Correlations of scores on the Vane Kindergarten, Wechsler Preschool and Primary Scale of Intelligence and Metropolitan Reading Tests.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 518.—Administered to 30 kindergartners the Vane Kindergarten, the Wechsler Preschool and Primary Scale of Intelligence (WPPSI), and the Metropolitan Reading Readiness Tests. Correlations between scores on the 2 intelligence tests and the Metropolitan test were fairly comparable. Total Metropolitan score correlated .56 with Total Vane IQ and .58 with WPPSI Full Scale IQ.—*Author abstract*.

885. Posnansky, Carla J. (U Colorado) **An investigation of serial learning and retention processes in children.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 127-148.—Conducted 3 studies to investigate both serial learning (SL) and retention processes in 252 1st-6th graders. SL processes were

evaluated for both pictorial and verbal materials by use of a probing methodology, and retention processes were studied as a function of the amount of intratask interference during original learning. All 3 SL stimuli considered (prior item, serial position, and prior-item cluster) were found to be functional, although the prior-item stimulus was most frequently used. Additionally, SL rate improved with increasing age. The introduction of interference into SL through acoustic, associative, or semantic similarity facilitated retention in control as well as proactive and retroactive inhibition conditions. Pictorial serial list items improved SL performance only for 2nd, 3rd, and 4th graders, while 5th graders performed better with verbal materials and 6th-grade performance was comparable in both presentation modes. (25 ref)—*Journal abstract*.

886. Pufall, Peter B. (Smith Coll., Clark Science Center) **Induction of linear-order concepts: A comparison of three training techniques.** *Child Development*, 1973(Sep), Vol. 44(3), 642-645.—Trained 45 kindergartners who had failed to attain criterion on 3 tests of linear order under 1 of 3 conditions. Reciprocity training gave the S practice in constructing orders identical with (ABC) or the reciprocal of (CBA) a model (ABC). Reversibility training included reciprocity training and experience predicting and observing the outcome of a 135° rotation and its reverse (-135°). Discrimination training required the S to identify pairs of orders as identical, reciprocals, or different (e.g., ABC to ACB). Under all 3 conditions Ss demonstrated learning during training and significant specific transfer effects, while only reversibility training led to generalized transfer to all 3 tasks during posttesting.—*Journal abstract*.

887. Ramirez, Manuel & Price-Williams, Douglass. (U California, Riverside) **Cognitive styles in children: Two Mexican communities.** *Revista Interamericana de Psicología*, 1974, Vol 8(1-2), 93-101.—Administered the rod-and-frame test to 136 Mexican school children of both sexes, aged 9-11 and 13-15 yrs, who were from a traditionally and conservatively oriented community or from a less traditional community located near the US border. Children's mothers were interviewed and tested with a socialization questionnaire. Results indicate that children from the traditionally oriented community were more field dependent in their cognitive styles. Differences between mothers in the 2 communities on the socialization questionnaire were not significant. The need to modify the field-dependent socialization cluster is discussed. (Spanish summary)—*S. Slak*.

888. Riley, Larry & Flite, Gary. (Northwest Missouri State U.) **Syntagmatic versus paradigmatic paired-associate acquisition.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 375-376.—Tested the hypothesis that the syntagmatic-paradigmatic shift in children's verbal learning occurs at increasing age levels as the complexity of the acquisition task is increased. A total of 20 2nd and 4th graders acquired lists of syntagmatic or paradigmatic paired associates to a criterion of 20 successive correct responses, but not necessarily on the same trial. Results show a significant symmetrical Grade Level  $\times$  List Type interaction. The syntagmatic Grade-2 and paradigmatic Grade-4 lists were more easily acquired than were the paradigmatic Grade-2 and

syntagmatic Grade-4 lists. It is concluded that the shift appears in paired-associate acquisition after it appears in associative recognition acquisition and before it appears in sentence creation tasks.—*Journal abstract.*

889. Rosenthal, Ted L. & Zimmerman, Barry J. (U. Arizona) **Organization, observation, and guided practice in concept attainment and generalization.** *Child Development*, 1973(Sep), Vol. 44(3), 606-613.—Studied the degree of organization in presenting stimuli, and training through modeling vs guided practice, on a dial-reading concept using 144 3rd and 5th graders. Full stimulus organization created substantially stronger acquisition but no better transfer; all organization levels performed comparably in generalization, indicating that, under certain conditions, maximally organized intratask formats may not produce optimal intertask transfer. Vicarious training produced comparable learning among both grades and accounted for over twice as much dependent-measure variance as did direct guided practice, which interacted with grade level. Sex of child did not influence the results. (22 ref)—*Journal abstract.*

890. Ruble, Diane N. & Nakamura, Charles Y. (U. California, Los Angeles) **Outerdirectedness as a problem-solving approach in relation to developmental level and selected task variables.** *Child Development*, 1973(Sep), Vol. 44(3), 519-528.—Studied the relation between 4 aspects of outer-directedness (developmental trends, types of reinforcement, task difficulty, and pride) and the performance of 128 kindergartners and 1st, 2nd and 3rd graders on color identification and a block design task. Outer-directedness was assessed by S's glancing behavior during the 2 tasks. 2 types of reinforcement (extrinsic or intrinsic) were used, and Ss were told either that the task was very easy or very difficult. Results show that outer-directedness decreased with age, increased when the task was described as difficult, and was associated with pride ratings. The effectiveness of intrinsic reinforcement increased with age. (22 ref)—*L. Gorsey.*

891. Schaeffer, Benson; Eggleston, Valeria H. & Scott, Judy L. (U. Oregon) **Number development in young children.** *Cognitive Psychology*, 1974(Jul), Vol. 6(3), 357-379.—Presents new data on children's acquisition of counting skills, based on tests with 65 Ss aged 2 yrs to 5 yrs 11 mo. 3 aspects of counting were studied: the formation of the cardinality rule that the last number named during counting denotes the number of objects in an array, the mastery of the counting procedure or the coordination of ordered number names and objects counted, and the growth of the knowledge that  $x + 1$  is greater than  $x$ . A model is outlined which posits the hierarchic integration of 6 number skills to account for the growth of the knowledge that  $x + 1$  is greater than  $x$  and the development of number conservation. The 6 skills are the cardinality rule, the counting procedure, acquisition of more  $x$ 's, judgments of relative numerosity, pattern recognition of small numbers, and one-to-one correspondences. (20 ref)—*Journal abstract.*

892. Schou, Peter. (Copenhagen U, Denmark) **[Associations and linguistic development.]** (Danish) *Nordisk Psykologi*, 1973, Vol. 25(2), 134-143.—Discusses the correlation between associations and linguistic

development from the viewpoint of behavioral and generative linguistic models. (English summary)

893. Sheldon, Amy. (U. Minnesota) **The role of parallel function in the acquisition of relative clauses in English.** *Journal of Verbal Learning & Verbal Behavior*, 1974(Jun), Vol. 13(3), 272-281.—Tested 33 44-65 mo old nursery school children for their comprehension of 4 types of sentences with relative clauses, to determine the role of the following factors in comprehension: (a) position of the embedded clause, (b) word order in the embedded clause, and (c) grammatical functions of the identical noun phrases. Results indicate that if the identical noun phrases had the same function in their respective clauses the sentence was significantly easier to understand. The nonsignificant effects of the position of the embedded clause and of the word order in the relative clause disconfirm a putative universal of language acquisition, which has recently been proposed by D. I. Slobin (1971). The parallel function hypothesis is proposed to account for the present findings, and the implications that it has for the grammar of adult English are considered. (23 ref)—*Journal abstract.*

894. Simon, A. & Ward, L. O. (University Coll Swansea, Wales) **Age, ability and positioning variables influencing pupils' judgments of the size of the Müller-Lyer illusion.** *Perceptual & Motor Skills*, 1974(Jun), Vol. 38(3, Pt 2), 1339-1343.—Tested 80 11-14 yr olds on the Müller-Lyer illusion. At each age, 10 Ss were classified as remedial and 10 as normal with respect to reading ability on the Schonell Silent Reading Test (R4). The illusion was presented with the starting position either in or out and to the right or left of S. No differences in susceptibility to the illusion attributable to age or reading ability were found, but the direction of the starting point significantly affected performance.—*Journal abstract.*

895. Simpson, Elizabeth L. (U. Southern California) **Moral development research: A case study of scientific cultural bias.** *Human Development*, 1974, Vol. 17(2), 81-106.—Analyzes evidence supporting the hierarchy of moral reasoning (from the lowest stage of blind acceptance of powerful authority to the application of abstract principles of justice and equality) and the claims put forth for the cross-cultural universality of the cognitive-developmental theory. Findings suggest that the definitions of stages and the assumptions underlying them, including the view that the scheme is universally applicable, are ethnocentric and culturally-biased. (55 ref)

896. Stenild, Mariane. (U. Aarhus, Psychological Inst, Denmark) **[The importance of language in the cognitive development of children.]** (Danish) *Nordisk Psykologi*, 1973, Vol. 25(2), 93-104.—Discusses different views of the role of language in the cognitive development of children. J. Piaget held that language is of no importance in cognitive development. Russian scientists have held that communication emphasizes the orienting, selecting, and guiding functions of language. An anthropological-linguistic tradition accentuates the importance of the categorical character of word symbols and syntax. The various theories have not been unambiguously corroborated in experiments. The important factors in linguistic influence, the significant development stages, and the

activities which language may influence must be specified. (English summary) (24 ref)—*P. Mylov.*

897. Tanaka, Toshitaka; Iwasaki, Junko & Miki, Chise. (Osaka Coll of Social Work, Japan) [Development of the cognition of letters: I.] (Japn) *Japanese Journal of Psychology*, 1974(Apr), Vol 45(1), 37-45.—Investigated which of 2 types of Japanese written symbols (Hiragana or Kanji) are DC to recognize, whether there are sex differences in recognition performance, and whether horizontal or vertical arrangements of letters are easier to recognize. 5-14 yr old Ss were administered a letter-cancelling task for each type of written characters. Results show that (a) Hiragana was easier to recognize than Kanji for 5-7 yr old Ss, (b) Kanji was easier to recognize than Hiragana for Ss over 8 yrs of age, (c) females had better recognition scores than males, and (d) horizontal arrangements were easier to recognize than vertical ones.—*English abstract.*

898. Toner, Ignatius J. (U North Carolina, Charlotte) Maintenance of delay behavior in grade school children. *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1247-1250.—Gave 48 8-11 yr olds a delay-of-reward task in which possession of accumulating candy rewards was made contingent upon the stopping of further accumulation. Ss exposed to the candy during the waiting period did not have different delay times from those in the reward-absent condition. However, while delay in the reward-present condition did not increase with age, delay in the reward-absent condition was positively related to age. The mechanisms of delaying ability which continued to develop during the school years involved consideration of goal objects which were physically absent. A variation in interreward interval did not affect delay times.—*Journal abstract.*

899. Van Duyne, H. John. (Northern Illinois U, Cognitive Studies Lab) Age and intelligence factors as predictors of the development of verbal control of nonverbal behavior. *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 321-331.—Investigated whether verbal IQ, performance IQ, or chronological age is a better predictor of verbal control of nonverbal behavior. The Wechsler Preschool and Primary Scale of Intelligence and a verbal control task were administered to 20 4-yr-old and 20 5-yr-old children. Results of a stepwise regression analysis indicate performance IQ as the best predictor of verbal control of nonverbal behavior, followed by age, and then verbal IQ. It is theorized that performance IQ and verbal control of behavior require integration of the auditory decoding system and visual-motor encoding system, while verbal IQ does not require that integration. The finding that age is a better predictor than verbal IQ was a product of the statistical procedure employed with 1 notable exception: the female population.—*Journal abstract.*

900. Vietze, Peter; Foster, Martha & Friedman, Steven. (George Peabody Coll for Teachers) Response differentiation in infants: A sex difference in learning. *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 479-484.—Conducted an experiment with 8 male and 8 female infants 10 wks old. A visual stimulus was made contingent upon free-operant directional head turns. Male infants significantly increased their rate of head turns to the rewarded side while rate of turns in the nonrewarded direction did

not change from baseline levels. Female infants did not demonstrate conditioning. The finding of a significant sex difference in response differentiation is discussed in terms of previous research which suggests that sex differences in conditionability may be a function of mode of reinforcement.—*Journal abstract.*

901. Williams, David V. (Ithaca Coll) Children's verbal learning and comprehension in aural and visual modes. *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 503-509.—Compared paired-associates, sentences, and prose passages in auditory and visual presentation to 96 4th-6th graders. Immediate and delayed measures of memory/comprehension were employed. The materials were chosen to be representative of verbal activities in educational settings and tasks separately employed in previous studies. The auditory mode was significantly superior in the prose-delayed condition. A 2nd study with 70 3rd graders assessed the effects of "availability" of stimulus materials across modes, pointing to the need for a clearer understanding of variables associated with mode and practice effects within modes.—*Journal abstract.*

902. Zurabashvili, Avlipl D. (M. Asatiani Research Inst of Psychiatry, Tbilisi, USSR) The problem of the interrelationship of structure and function. *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jan), Vol 26(1), 1-5.—Speculates on the ontogenic development of the human central nervous system. Recent research in synaptoarchitectonics suggests that ontogeny is not a simple repetition of phylogeny and the basic biogenetic recapitulation law requires correction. Work with electron microscopy confirms that psychoneural functions are tremendously complex and cannot be reduced to the category of physical energy.—*K. J. Hartman.*

### Emotional & Personality Development

903. Angel, Klaus. The role of the internal object and external object in object relationships, separation anxiety, object constancy and symbiosis. *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 541-546 8(1).—Supports the idea that early object relationships, separation anxiety, and symbiosis can be accurately described only by distinguishing between the role of internal and external objects. In addition it is suggested that symbiosis and separation anxiety are intrapsychic concepts and do not describe "who leaves whom" or "who does what to whom." 2 meanings of object constancy are defined: early and late need-fulfilment lessens in later life but does not disappear. The relationship between separation anxiety and object constancy is also discussed.—*R. S. Albin.*

904. Bates, John E.; Bentler, P. M. & Thompson, Spencer K. (Indiana U) Measurement of deviant gender development in boys. *Child Development*, 1973(Sep), Vol 44(3), 591-598.—Describes the development of a parent-report Gender Behavior Inventory for Boys. This inventory was factor analyzed (Study I) and validated (Study II) using normal and extremely effeminate 5-12 yr old boys. 4 factors—Feminine Behavior Extraversion, Behavior Disturbance, and Mother's Boy—emerged. Highly significant mean differences were obtained between a clinical sample of 15 gender-problem referrals and 175 normal controls on 3 of the 4 factors:

the gender-problem boys were more effeminate and less extraverted, and showed more behavior disturbances. Within the range-restricted clinical sample, clinical judgments of severity of gender disturbance correlated moderately well only with the feminine behavior factor. Age-trend analyses (Study III) showed an overall tendency for normal 5-10 yr old boys to show less cross-gender behavior (feminine behavior) with increasing age; however, specific cross-gender behaviors had low frequencies even at the youngest ages. (18 ref)—*Journal abstract*.

905. Cangemi, Joseph P. & Englander, Meryl R. (Western Kentucky U) **From self-awareness to self-actualization.** *College Student Journal*, 1974(Apr), Vol 8(2), 88-92.—Defines complete self-awareness as the ability to view oneself objectively. Self-awareness is suggested as the key to survival in this period of anxiety. Failure to attain the proper level of self-awareness usually leads to a sense of inadequacy and to emotional turmoil, reactions which hamper the individual's ability to function in society. Adequate self-awareness is the first step toward self-actualization or self-fulfillment. The intervening steps are insight, self-understanding, self-acceptance, psychological growth, psychological health, and self-actualization. It is suggested that one of the goals of education, particularly higher education, should be to teach the student self-awareness and possibly self-actualization. (22 ref)—A. J. Ter Keurst.

906. Cohen, Stewart & Oden, Sherri. (U Rhode Island) **An examination of creativity and locus of control in children.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 179-185.—Examined the adequacy of the locus of control concept in relation to creative behavior in samples of 61 kindergartners and 69 2nd graders. Among female 2nd graders creativity performance, as assessed by an adapted form of M. A. Wallach and N. Kogan's Instances task, was significantly correlated with locus of control scores. In contrast, among male kindergartners, locus of control scores were negatively correlated with creativity measures, as examined by the Wallach and Kogan Uses test. Probable explanations of the data are reviewed in terms of sex and age differences. (18 ref)—*Journal abstract*.

907. Cohen, Stewart. (U Rhode Island) **Exploratory task behavior and creativity in young children.** *Home Economics Research Journal*, 1974(Jun), Vol 2(4), 262-267.—Investigated the association between exploratory task performance and creativity in 129 kindergartners and 2nd graders. Exploratory behavior was assessed with a series of embedded figures tests, and creativity was assessed using the Instances Test. Among kindergartners of both sexes, exploratory and creativity measures were positively correlated. However, a different pattern of correlations was observed among 2nd graders; particularly among males, correlations were sharply lower than for the kindergartners. Data indicate that the early established exploration-creativity relationship may not hold over time. Developmental differences and children's exposure to structured learning environments in more advanced grades may account for the results. (17 ref)—*Journal abstract*.

908. Gottfried, Allen W. & Gottfried, Adele E. (Albert Einstein Coll of Medicine, Rose F. Kennedy Ctr

for Research on Mental Retardation & Human Development, Yeshiva U) **Influence of social power vs status envy modeled behaviors on children's preferences for models.** *Psychological Reports*, (Jun), Vol 34(3, Pt 2), 1147-1150.—Compared social power theory and J. W. Whiting's (1960) status envy theory for their effects on children's model preferences. 30 kindergarten children observed a show in which neuter gender puppets exhibited behaviors dictated by these theories. Statistical analyses showed that (a) sex was not associated with model preference and (b) the status envy model was significantly preferred by Ss. It is concluded that models who dispense both positive and negative reinforcements are not likely to be preferred to models consuming positive reinforcements. Results are interpreted within a social learning framework.—*Journal abstract*.

909. Joshi, Ram T. (Langley County Secondary School, Slough, England) **Field-dependence, anxiety and personality.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1328.—Administered the short form of the Embedded Figures Test, the Junior Manifest Anxiety scale, and the Junior Maudsley Personality Inventory to 143 British 12 yr olds. A correlation of .23 ( $p < .01$ ) was obtained between neuroticism and manifest anxiety, but all other correlation coefficients were not significant.

910. Lifshitz, Michaela. (Haifa U, Israel) **Social locus-of-control dimension as a function of age and the socialization milieu.** *Child Development*, 1973(Sep), Vol 44(3), 538-546.—Administered Crandall's Intellectual Achievement Responsibility questionnaire (IAR) to 183 9-14 yr children 3 kibbutz movements in Israel to explore the meaning of locus of control among children raised within a specified framework. 62 of the Ss were considered to be "problematic." Differing mental health status and sex of Ss did not significantly affect the responses to the questionnaire. On the other hand, responses varied significantly as a function of (a) age, with gradual increase in self-crediting and self-blaming responses; and (b) having been reared in different kibbutz movements. This finding may reflect differential socialization influences upon the acquisition of perceptions of internal-external control across the developmental span. Ss reported having more control over results as they were probably given more freedom and responsibility to conduct their own affairs. (24 ref)—*Journal abstract*.

911. Mann, John. (State University Coll New York, Geneseo) **Learning to be: The education of human potential.** New York, NY: Free Press, 1974. xii, 269 p. \$3.95.—Attempts to create an "internal curriculum" to help children develop their feelings as well as their intellects, and explores such new learning methods as psychosynthesis, Tai Chi Chuan, and tantric yoga. Awareness and sensitivity techniques are adapted for classroom use and are related to 15 basic human functions (e.g., creative expression, intelligence, attending, and the will).

912. Stephens, Mark W. & Delys, Pamela. (Purdue U.) **External control expectancies among disadvantaged children at preschool age.** *Child Development*, 1973(Sep), Vol. 44(3), 670-674.—Compared internal-external control (I-E) expectancies of disadvantaged preschool children in Head Start classes with those of middle-class

children in 1 Montessori and 2 parent cooperative nursery schools using the Stephens-Delys Reinforcement Contingency Interview (SDRCI). There were 55 Head Start (1 white group and 1 black group), 16 Montessori, and 34 parent cooperative nursery school children. The middle-class groups had significantly higher internal control scores than did the Head Start groups but did not differ from each other, and the black and white Head Start groups did not differ significantly from one another. It is concluded that the external control expectancies of both black and white disadvantaged children appear to precede their school attendance. (21 ref)—*Journal abstract*.

913. West, Malcolm L. **Social roles and personal styles: A proposed classification system of child behavior.** *Psychotherapy: Theory, Research & Practice*, 1974(Spring), Vol 11(1), 93-96.—Proposes a method for classifying child behavior that is useful for the counselor. The system represents the child's personality as an integration of social roles and personal styles. The child's emerging personality is viewed as a synthesis of social roles external to him (child, pupil, and friend) with his unique enactment of these roles based upon his active adaptation to them (personal styles). Case studies illustrate this classification system.—C. P. McCreary.

#### Social Behavior & Family Relations

914. Ames, Louise B. & Chase, Joan A. (Gesell Inst of Child Development, New Haven, CT) **Don't push your preschooler.** New York, NY: Harper & Row, 1974. x, 212 p. \$6.95.—Suggests that parents learn to relax and enjoy their children, rather than attempting to increase their learning abilities or intelligence, since children learn to walk, talk, and think without adult interference. Recommendations for helping the child to know himself and for enriching his environment are presented, along with solutions to various problems and issues encountered when raising a preschool child. (62 ref)

915. Beach, David R. & Sokoloff, Mark J. (U Wisconsin, Parkside) **Spatially dominated nonverbal communication of children: A methodological study.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1303-1310.—Developed procedures and scales for time-sampling 4 aspects of children's nonverbal communication activity: distance, orientation, position, and visual regard. These scales, plus an index of verbalization, were applied to videotaped recordings of 6 girls and 8 boys, all 4 or 5 yrs old, chosen at random from same-sex, same-age, triads engaged in free play. Interrater scale reliabilities ranged from .39 for verbalization and .85 for position. Contrary to prediction, girls maintained greater distance than did boys. Interscale correlations were suggestive of other sex differences and provided validation of the general procedures. Regression analyses for each sex indicated that distance behavior was significantly related to a composite of the other communication behaviors assessed. (15 ref)—*Journal abstract*.

916. Chaplin, Mary V. & Keller, Harold R. (U South Carolina) **Decentering and social interaction.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 269-275.—Investigated the hypothesis that children who interact effectively with their peers are better able to decenter (i.e., take the point of view of another) in interpersonal

areas than children who do not interact effectively with their peers. 48 3rd and 6th graders participated in the study involving a 2 (grade level)  $\times$  2 (sex)  $\times$  2 (effective and ineffective social interaction based upon popular and unpopular sociometric ratings, respectively) factorial design. M. Feffer's role-taking task and Piaget's mountain task were used as measures of decentering in interpersonal and impersonal areas, respectively. 6th graders performed significantly better than 3rd graders on the role-taking task, and 3rd graders rated as poor social interactors scored significantly lower on the role-taking task than the other groups. There were no significant differences among groups on the Piagetian mountain task, and no sex differences on either task. Correlations between scores on the 2 tasks reveal a significant positive relationship for the unpopular 3rd graders only. (17 ref)—*Journal abstract*.

917. Cohen, Stewart & Przybycien, Colette A. (U Rhode Island) **Some effects of sociometrically selected peer models on the cognitive styles of impulsive children.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 213-220.—Investigated the influence of peer models on the modification of impulsive response styles among 50 4th and 6th graders. Sociometrically chosen peers were trained to provide reflective verbal and behavioral cues in responding to a selected task. They later performed these skills in the presence of a peer O. A comparison of posttest performance measures of peer Os with control Ss revealed significant increases in response latencies and decreases in error scores among Ss exposed to peer models.—*Journal abstract*.

918. Dielman, T. E.; Barton, K. & Cattell, R. B. (U Michigan, Inst for Social Research, Survey Research Ctr) **Relationships among family attitude dimensions and child motivation.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 295-302.—Administered the Family Attitudes Measure, which examines dimensions of intrafamilial attitudes, to the parents of 250 junior high school children. The children were tested on the School Motivation Analysis Test (SMAT). Among the many relationships obtained the most consistent predictor of SMAT scores was that of interspouse hostility, which was positively related to the children's assertiveness and sex scores and negatively related to children's narcissism, protectiveness, and superego scores. In the case of the child self-sentiment scores a reversal occurred, with the fathers' interspouse hostility being positively related and the mothers' negatively related. Results are tentative pending cross-validation; they are regarded as hypothesis generating rather than as hypothesis testing. Although the linear multiple regression model used is a powerful one, it would not be unreasonable to expect interactions among some of the family attitude factors and, further, interactions of these factors with sex of the child and family demographic variables.—*Journal abstract*.

919. Duck, Steven W. (U Lancaster, England) **Personal relationships and personal constructs: A study of friendship formation.** New York, NY: John Wiley & Sons, 1973. ix, 170 p. \$12.—Discusses social relationships, problems of interpersonal attraction, and stages of acquaintance and describes a longitudinal study of developing friendship patterns. The filtering theory is

developed, and early filtering is examined and evaluated. (7 p ref)

920. Farnill, Douglas . (Duke U, Graduate School) **The effects of social-judgment set on children's use of intent information.** *Journal of Personality*, 1974(Jun), Vol 42(2), 276-289.—Compared the effects of 2 types of social judgment situations, moral judgment and value maintenance, on children's consideration of intentionality in their evaluations of others. A total of 84 male kindergartners, 1st graders, and 3rd graders made ratings of 6 peer actors presented individually in a videotaped episode involving the breaking of flowerpots. The 6 episodes combined 3 intention conditions (malicious intent, good intention associated with unavoidable accident, and good intention associated with ineptitude) with 2 levels of negative consequence (1 or 4 flowerpots broken). 42 Ss evaluated the actors from a moral judgment standpoint and 42 from a value-maintenance standpoint. Ss' use of intention varied with the type of evaluatory situation. In value maintenance situations, Ss differentiated between the malicious and accidental conditions significantly more than in the moral judgment situations. It is concluded that value maintenance conditions allow children greater freedom to adopt whatever basis of evaluation is most conducive to the attainment of personal goals, while moral judgment situations generally inhibit the consideration of intentionality.—*Journal summary*.

921. Garvey, Catherine & Hogan, Robert . (Johns Hopkins U) **Social speech and social interaction: Egocentrism revisited.** *Child Development*, 1973(Sep), Vol 44(3), 562-568.—Studied the development of social speech by videotaping 18 dyads of children (3½-5 yrs old) in 15-min play sessions. Behavior was coded by the time children spent in mutual interaction, and speech was coded by the degree to which utterances were adapted to the verbal or nonverbal behavior of the partner. Results indicate a high level of mutual responsiveness in both speech and behavior. It is suggested that children in this age range are capable of genuinely social behavior, that early forms of social speech entail a surprising level of interpersonal understanding, and that these speech forms are amenable to systematic study. (16 ref)—*Journal abstract*.

922. Graves, Donna; Walters, James & Stinnett, Nick . (Oklahoma State U) **Relationship between perceptions of family life and attitudes concerning father-son interaction.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 303-309.—Developed a form of the Home Life Scale for university men, an instrument which provides a measure of perceptions of their home life in their families of orientation; and examined the perceptions of 108 male undergraduates in relation to selected background characteristics and to their attitudes concerning father-son relationships. No significant relationships were observed between (a) home life perceptions and (b) age, marital status, father's occupation and education, source of family income, and socioeconomic status of parents; nor were any significant relationships observed between (a) attitudes concerning father-son relationships and (b) age, marital status, father's occupation and education, source of family income, and socioeconomic status of parents. However, a significant

relationship ( $p = .05$ ) was observed between home life perceptions and attitudes concerning father-son relationships, indicating that those Ss who hold negative perceptions concerning their families of orientation reflected the most permissive attitudes concerning father-son relationships.—*Journal abstract*.

923. Greenberg, Kenneth R. (U Maryland) **A tiger by the tail: Parenting in a troubled society.** Chicago, IL: Nelson-Hall, 1974. xii, 259 p. \$7.95.—Presents guidelines for early child training and for rearing older children and adolescents, and discusses the impact of public education on the child, the contributions that parents can make to educational problems, and the relationship between a child and his parents after the child marries and becomes a parent.

924. Grossman, Bruce D. & Levy, Paul S. (Hofstra U) **A factor analytic study of coping behavior in preschool children.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 287-294.—Examined the potential use of factor analytic techniques to identify personality dimensions in young children. The present scales were designed to reflect a child's total area of functioning and to require the least amount of interference on the part of the rater. 3 studies were done with a total of 129 3-6 yr old children. Of the factors identified, 3 were reproduced consistently in each of the studies. Factor I, Social Confidence, is characterized by leadership and assertiveness in interpersonal relations. Factor II, Cooperation, suggests a passivity in interpersonal relations and somewhat of a dependent stance. Factor III, Persistence, reflects a potential for problem solving and task orientation and has some relationship to autonomy. 2 additional factors which appeared rather consistently are Mobility and Aggression. Results suggest the possibility of deriving factor scores for separate children for comparative and developmental study.—*Journal abstract*.

925. Heilbrun, Alfred B. (Emory U) **Parental evaluative history and selective recognition of evaluative words.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 259-268.—Hypothesized that prior social experience influences current perception of historically relevant cues. 78 male undergraduates were separated into those who rated their fathers positive in their evaluations of them (HN) and those who rated their fathers as more negative (LN). These groups did not differ in their perception of maternal evaluative cues when presented alone. When paternal evaluative cues were presented as distractors, selective attention to maternal cues was more disrupted for the LN group. Deployment of attention to task-irrelevant paternal cues did not differ for the HN and the LN groups. However, the LN Ss did demonstrate a negative qualitative bias in those intrusion errors which came from the task-irrelevant paternal set, whereas HN Ss showed a positive qualitative bias. It is concluded that greater disruption of LN task performance may have been the result of responses, such as anxiety, associated with their negative bias.—*Journal abstract*.

926. Lahiri, Subrata . (International Inst for Population Studies, Bombay, India) **Preference for sons and ideal family in urban India.** *Indian Journal of Social Work*, 1974(Jan), Vol 34(4), 323-336.—Reports that in the sample surveyed (16,000 husbands) all sections of the

population, regardless of economic status, expressed a 2 to 1 preference for sons rather than daughters. The preference was lowest in the large metropolitan areas, and decreased among the older respondents. Ideal family size stabilized at 3.38 toward the end of family building years. Increased education was associated with a smaller ideal family.

927. Lee, Robert A. (El Camino Coll) **Socialization-anxiety: Toward an integrated theory of human behavior.** Dubuque, IA: Kendall/Hunt, 1974. xi, 226 p. —Presents the background and derivation, rationale, and methodology of a new theory which suggests that socialization and anxiety are the fundamental and exclusive determinants of human behavior. A review of the related literature and research hypotheses and applications of the theory to varieties of behavior, therapy, personality, and society are included.

928. Meares, Russell & Horvath, Thomas. (U Melbourne, Austin Hosp, Heidelberg, Vic, Australia) **A physiological approach to the study of attachment: The mother's attention and her infant's heart rate.** *Australian & New Zealand Journal of Psychiatry*, 1974(Mar), Vol 8(1), 3-7.—Studied 14 mothers and their neonatal babies in a maternity hospital during breast-feeding and control periods. Those mothers whose attention to external stimuli diminished during feeding, as inferred from habituation rate, had babies whose heart rates significantly increased during feeding. Mothers who did not show the expected relative inattention to external stimuli during feeding had babies whose heart rate did not significantly increase when they were fed. The possible relevance of these findings to the study of attachment behavior is considered. (21 ref)—*Journal abstract*.

929. Naffziger, Clauden C. & Naffziger, Ken. **Development of sex role stereotypes.** *Family Coordinator*, 1974(Jul), Vol 23(3), 251-258.—Briefly reviews the development of patriarchal systems and the cognitive, affective, and conative aspects of stereotyping. Research on sex differences in stereotyping is discussed, emphasizing the role of schools and family structures in supporting stereotypes. Suggestions for demystifying sex roles are presented, and the need to be aware of every individual's potential is noted. (20 ref)

930. Prothro, Edwin T. & Diab, Lutfy N. (American U Beirut, Lebanon) **Changing family patterns in the Arab East.** Beirut, Lebanon: American University in Beirut, 1974. ix, 240 p. \$10.—Presents a sociological and psychological study of family patterns in Sunni Muslim families in cities and villages of Lebanon, Syria, and Jordan. Data from interviews with over 2,000 women are included, along with discussions of census data, government statistical reports, and comparative studies of other cultures in the areas of courtship and marriage, extended family ties, modesty and the role of women, and divorce and polygyny. (8½ p ref)

931. Reilly, Mary (Ed.). (U Southern California) **Play as exploratory learning: Studies of curiosity behavior.** Beverly Hills, CA: Sage, 1974. 314 p.—Presents an heuristic approach to the phenomenon of play, searching for the general questions about external and internal reality that play can answer and applying specific play questions to the behavior of the deficit child.

932. Rubin, Kenneth H. & Schneider, Frank W. (U. Waterloo, Ontario, Canada) **The relationship between moral judgment, egocentrism, and altruistic behavior.** *Child Development*, 1973(Sep), Vol. 44(3), 661-665.—Administered cognitive measures of communicative egocentrism and moral judgment to 55 7-yr-old children. Ss were then given 2 opportunities to display altruistic behavior—to donate candy to poor children and to help a younger child complete a task. Success on the 2 cognitive measures was positively correlated with the incidence of altruistic behavior in both altruism conditions. With Peabody Picture Vocabulary Test mental age partialled out, the correlations between the cognitive measures and donating candy were significantly lower than the correlation between the cognitive measures and helping. The difference between the correlations was accounted for by the fact that only in the candy donation were there cues that helped S attend to the possibility of emitting an altruistic act. Finally, the communicative and moral judgment measures were significantly correlated. (16 ref)—*Journal abstract*.

933. Schmitz-Scherzer, Reinhard; Bierhoff, Hans W.; Lustig, Annette & Güth, Karl. (Psychological Inst., Bonn, W. Germany) **[Visitor frequency of playgrounds: A pilot study.]** (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol. 6(1), 51-59.—Interviewed 100 mothers of 2-8 yr old children playing on 6 urban playgrounds. Results show that the motivation of the attendance of playgrounds is very complex; the socioeconomic situation as well as urban geographical aspects were quite important.—*English summary*.

934. Skeris, Piotr. **[Models of family life in workmen's quarters of a large town.]** (Polh) *Roczniki Filozoficzne*, 1973, Vol. 21(2), 77-103.—Presents data on living conditions and delinquency in a Polish municipal housing project, collected during interviews with 328 resident families. Analyses show that (a) family life was less influenced by the member's rural-urban origins than by educational and training levels; (b) the highest birth rate occurred among unskilled laborers and the lowest among skilled and white-collar workers, although the birth rate was decreasing rapidly among all socioeconomic groups; (c) fewer wives of skilled workers than of laborers were employed, and those wives who worked were predominantly domestics; and (d) neglect of the children of unskilled workers, because of employed mothers' absence from the home, resulted in a considerable amount of juvenile delinquency. It is concluded that better planning of municipal housing projects to provide for socioeconomically homogeneous populations, better facilities, and increased social services is urgent.—*English summary*.

935. Starr, Jerold M. (U Pennsylvania) **Social structure and social personality.** Boston, MA: Little, Brown, 1974. xiii, 461 p. \$12.95.—Presents an overview of the structure and process of socialization, emphasizing the impact of institutions on individuals. Major topics include the patterning of personality, the effects of technology and of class and race stratification on personality, and the role of the agents of socialization.

936. Stevens-Long, Judith. (California State U, Los Angeles) **The effect of behavioral context on some aspects of adult disciplinary practice and affect.** *Child*

*Development*, 1973(Sep), Vol 44(3), 476-484.—Parents (57 mothers and 3 fathers) of elementary school children responded to videotaped sequences portraying either an overactive, an underactive, or an average-active child. Ss selected a disciplinary practice and recorded affect toward the children at 10 points during the sequences, 5 of which occurred after S viewed a brief incident of aggression by the child. It was hypothesized that overactive children would be punished more severely than the other children; that the label "emotionally disturbed" would influence adult responses; and that affect and choice of discipline would be correlated. Analysis of variance generally supported these hypotheses, although there were interactions among aggression, activity level and labeling for choice of discipline. Moreover, the underactive child evoked more severe punishment under some conditions than the average-active child.—*Journal abstract*.

937. Tautermannová, M. **Smiling in infants.** *Child Development*, 1973(Sep), Vol 44(3), 701-704.—Studied the development of smiling in 7 infants over a 24-wk period. Data from 1-hr observations show that the duration of smiling depended on the age of infants, on the social interaction between the adult and the infant, and on the time that had passed from the beginning of the observation. There were significant individual differences in the length of smiling that increased with age. There were also individual differences in infants in their reaction to social interactions with adults.—*Journal abstract*.

938. Thomas, L. Eugene & Stankiewicz, John F. (U Connecticut) **Family correlates of parent-child attitude congruence: Is it time to throw in the towel?** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1038.—Determined the congruence between 66 college juniors and their parents for 16 measures of political, social, and psychological attitudes. 7 indices of family emotional climate and interaction (e.g., permissiveness) were devised from parent and child interviews. These family measures failed to correlate significantly with attitude congruence for any of the 4 parent-child dyads.

939. Weiss, Walter F. (Indiana Youth Ctr, Communications Lab) **America's wandering youth: A sociological study of hitchhikers in the United States.** Jericho, NY: Exposition Press, 1974. xvi, 95 p. \$4.50.—Discusses the psychological, philosophical, and religious forces which have molded today's youth, examines the society in which they live, and considers the ongoing evolution of 3 basic American institutions—the family, the school, and the church.

940. Zinner, John & Shapiro, Roger. (NIMH, Section of Personality Development, Bethesda, MD) **Projective identification as a mode of perception and behaviour in families of adolescents.** *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 523-530.—Examines family group dynamics in relation to psychological outcome of the adolescent. A case history of a family is presented. Family group behavior and subjective experience are determined to varying degrees by shared unconscious fantasies or assumptions. The threat of parental anxiety and object loss is an important factor determining the collusion of the adolescent with parental projections. (24 ref)—R. S. Albin.

## Adult Development & Aging

941. Bell, Bill D. (U Arkansas, Little Rock) **Cognitive dissonance and the life satisfaction of older adults.** *Journal of Gerontology*, 1974(Sep), Vol 29(5), 564-571.—Examined the implications of consistency theory with regard to the life satisfaction of older adults, by conducting pre- and postretirement interviews with 114 older males in an urban area. With the exception of the family area, pre- and postretirement analysis yielded little support for the consistency hypothesis (i.e., expectational disconfirmation will be accompanied by negative changes in life satisfaction). Instead, some evidence indicates the type of disconfirmation to be more central to the explanation of life-satisfaction change than disconfirmation per se. In the family, for instance, the more positive the disconfirmation indicated, the more negative the change evidenced in life satisfaction. For voluntary association and community sectors, however, disconfirmation (both positive and negative) as well as the specific type of disconfirmation bore little relationship to the issue of satisfaction change. Findings do, however, suggest differential "rewards" to characterize the role areas in question. (33 ref)—*Journal abstract*.

942. Botwinick, Jack & Storandt, Martha. (Washington U) **Cardiovascular status, depressive affect, and other factors in reaction time.** *Journal of Gerontology*, 1974(Sep), Vol 29(5), 543-548.—Several previous studies suggest that reaction-time (RT) slowing with increasing adult age may be different for men and women, and that RT slowness is related to cardiovascular symptoms, to depressive affect symptoms, and to little physical exercise. Results of the present study with 96 20-74 yr old adults corroborated suggestions that RT slowness is related to cardiovascular and depressive affect symptoms. However, no sex differences in RT slowing were found. Physical exercise seemed to be associated with quick RT in young adults, but not in elderly ones. RT relationships with education level were also seen, but interactions between each of these factors and age were not found.—*Journal abstract*.

943. Carroll, Douglas. (Baltimore City Hosp. MD) **Sleep, periodic breathing and snoring in the aged: Control of ventilation in the aging and diseased respiratory system.** *Journal of the American Geriatrics Society*, 1974(Jul), Vol 22(7), 307-315.—Discusses studies of the mechanical characteristics of the human lung in relation to aging; most of these studies have involved conditions of stress or disease. To date there is no firm evidence that normal old age under ordinary conditions of living is associated with impaired regulation of respiration. (66 ref)

944. Glamser, Francis D. (Stetson U) **The importance of age to conservative opinions: A multivariate analysis.** *Journal of Gerontology*, 1974(Sep), Vol 29(5), 549-554.—Interviewed 118 23-66 yr old females to determine whether older people are more conservative than younger people with regard to opinions on controversial issues (e.g., race, law enforcement, and patriotism). Variables explored included age, size of childhood community, father's education and occupation, and respondent's education. A significant positive correlation was found between age and conservative opinions even when social class, education, father's

socioeconomic status, and the size of the respondent's childhood community were controlled. Only education was more important than age as a correlate of conservatism among the variables studied. There was no polarization of opinions on the basis of age. Of 3 suggested explanations for the relationship between age and conservative opinions, the social and cultural were seen as the most fruitful. (20 ref)—*Journal abstract*.

945. Gordon, Chad; Gaitz, Charles M. & Scott, Judith. (Texas Research Inst of Mental Sciences, Houston) **Value priorities and leisure activities among middle aged and older Anglos.** *Diseases of the Nervous System*, 1973(Jan), Vol 34(1), 13-26.—Studied leisure activities of 156 middle-aged (40-64 yrs old) and 152 older (65-94 yrs old) residents of Houston, Texas. A structured interview was used to obtain information regarding leisure, value preferences, social attitudes, and mental health. Numerous factors (e.g., age, sex, education, and income) were found to correlate with qualitative and quantitative indices of leisure activities. Important in explaining the great diversity of leisure forms is the idea of conceptualizing leisure as having dimensions of breadth, intensity, and activity-passivity; it is equally important to analyze leisure into different subdimensions.—*M. Oscar-Berman*.

946. Huyck, Margaret H. (Illinois Inst of Technology) **Growing older: What you need to know about aging.** Englewood Cliffs, NJ: Prentice-Hall, 1974. xii, 179 p.—Suggests ways to prepare for the aging process, how to help parents cope with aging, explains biological and psychological changes that occur during aging, and discusses middle-aged marriage and sex in old age. (16 ref)

947. Kahn, Samuel. **Essays on longevity.** New York, NY: Philosophical Library, 1974. 198 p.—Presents discussions on aging with respect to longevity, geriatrics, and gerontology. Among the topics included are the sociology of age, problems of retirement, "failing" senility, diseases of the aged, preventive treatment, and heart disease and diet.

948. Maddox, George L. & Douglass, Elizabeth B. (Duke U, Ctr for the Study of Aging & Human Development) **Aging and individual differences: A longitudinal analysis of social, psychological, and physiological indicators.** *Journal of Gerontology*, 1974(Sep), Vol 29(5), 555-563.—Conducted a longitudinal study in which a defined older population of 106 adults was observed 6 times over a period of 13 yrs. 2 hypotheses were affirmed: (a) individual differences do not decrease with age in late life; and (b) individuals tend to maintain the same rank on a variety of social, psychological, and physiological indicators in relation to their age peers throughout the later years of life. (23 ref)—*Journal abstract*.

949. Nystrom, Eleanor P. (U Puget Sound) **Activity patterns and leisure concepts among the elderly.** *American Journal of Occupational Therapy*, 1974(Jul), Vol 28(6), 337-345.—Conducted a descriptive interview survey among 65 60-90 yr old residents of a low-income urban housing development. Activity patterns, leisure concepts and uses, and meanings of leisure-time activities were examined. Results of an analysis of an activity index for frequency and variety of activity participation showed no differences due to age in the sample. Analysis

of leisure concepts showed that most Ss defined leisure as pleasant anticipation or recollection. Social interaction or being a spectator were the most frequent uses of leisure. Further study of leisure as freedom from obligation and of mechanisms for coping with nonstructured time seems indicated for understanding the elderly person's meaningful use of leisure. (32 ref)—*Journal abstract*.

950. Scheingold, Lee D. & Wagner, Nathaniel N. (U Washington) **Sound sex and the aging heart.** New York, NY: Human Sciences Press, 1974. 168 p. \$7.95.—Discusses marital and extramarital sex in the mid and later years, with special reference to cardiac problems. Sexual functioning, the consequences of aging, and resumption of sexual activity after a heart attack are detailed.

951. Warren, Harriet H. (New Hampshire Hosp, Concord) **Self-perception of independence among urban elderly.** *American Journal of Occupational Therapy*, 1974(Jul), Vol 28(6), 329-336.—Interviewed community-based older people to ascertain their assessment of health and functional capacities. An attempt was made to determine how older people rate their general health; how they perceive their level of independence in caring for their daily needs; and what concerns them most about being able to manage on their own. 65 60-90 yr old ambulatory men and women from a low-income housing project were surveyed. 74% reported relatively good health and fairly high independence, as defined by a 4-point dependence-independence scale. Reported areas of greatest concern were housecleaning and the ability to get out and around. (35 ref)—*Journal abstract*.

## CULTURAL INFLUENCES AND SOCIAL ISSUES

952. Berkowitz, Marvin. (New York City Police Dept, Applied Technology Group, NY) **The social costs of human underdevelopment: Case study of seven New York City neighborhoods.** New York, NY: Praeger, 1974. xv, 299 p.—Presents an empirical study based on the view that urban problems can be adequately assessed within a human capital framework in which unproductive city residents generate differentially high social costs (i.e., monetary and nonmonetary burdens that some individuals bear as a result of the actions of others). Topics include the dilemma of human underdevelopment, the generation and nature of social costs, neighborhood use of public services, costs of housing, fire protection, crime, and correlates of the social costs of crime. (16 p ref)

953. Luchins, Abraham S. & Luchins, Edith H. (State U New York, Albany) **Wertheimer's seminars revisited: Problems in social psychology: I.** Albany, NY: State University New York, Psychology Dept, 1971. 385 p.—The 1st of 2 volumes presenting M. Wertheimer's views on prewar problems in social science which continue to be perplexing. Discussion of the relevance, use, aims, ethics, and methodology of social science is followed by Wertheimer's analysis of various theories about the nature of man, in which he emphasizes how these theorists have attempted to shape and control man's thinking about himself. Many other aspects of

group theory, ethics, and personality are also considered.  
—*Author abstract.*

954. **Perrucci, Carolyn C. & Targ, Dena B.** (Purdue U) **Marriage and the family: A critical analysis and proposals for change.** New York, NY: David McKay, 1974. xvii, 457 p.—Presents a collection of 34 readings which combine feminist values with a sociological perspective of current American family life and marriage. Among the topics discussed are racial and social-class perspectives, sex-role socialization, birth control and abortion, economic aspects of marriage, and women in middle age.

### Culture & Ethnology & Race Relations & Religion

955. **Barber, Lucie W.** (Union Coll & U) **Ministry with parents of infants and preschool children.** *Religious Education*, 1974(Mar), Vol 69(2), 192-197.—Suggests that parents of young children can foster the best religious instruction of preschoolers, when their teaching provides individualized and continuous instruction within a loving atmosphere. Approaches to parent education could involve any of the following (or some combination): a home visitation instructional visit by the religious educator once or twice a week, a parents' education group in the church or synagogue, and a youth program in the church that prepares for parenting skills. An infancy design program has produced and tested actual curricular materials for parents of infants from birth to 30 mo old and is making use of various strategies and aids that parents of young children may incorporate into their religious instruction.—*E. Gavin.*

956. **Bell, Bill D.** (U Arkansas, Little Rock) **Church participation and the older adult: An orientational approach.** *Kansas Journal of Sociology*, 1974(Spr), Vol 10(1), 19-28.—Examined the utility of Jacoby's Instrumental-Expressive Orientation Indices in predicting the church participation of 54 United Methodist males (mean age = 65 yrs). Findings indicate significant differences between orientation scores. The respondents proved more instrumentally than expressively oriented toward the church. Further, a significant relationship was noted between Instrumental Orientation scores and church participation. No significant relationship was observed in Expressive scores. Ss tended to view participation in the church as a means to 1 or more social ends rather than as an end in itself. 24% of the variance in participation was explained without reference to religious antecedents. (23 ref)—*Journal abstract.*

957. **Berger, Peter L.** (Douglass Coll, Rutgers State U) **Some second thoughts on substantive versus functional definitions of religion.** *Journal for the Scientific Study of Religion*, 1974(Jun), Vol 13(2), 125-133.—Considers that scientific approaches to religion have always alternated between functional and substantive definitions of the field—between defining religion in terms of its social or psychological functions and in terms of its believed contents. Recently there has been a predominance of functional definitions, and apart from their scientific utility, they have come to serve an ideological use—as a quasi-scientific legitimation of the avoidance of transcendence. This is in accord with a secularized zeitgeist, but threatens to lose sight of the very phenomenon of religion. To regain the phenome-

non, what is required is a return to a substantive definition, an understanding of religion "from within." A. Schutz's analysis of "multiple realities" in human experience may serve as a useful starting point for this.  
—*Journal abstract.*

958. **Cheetham, R. W.; Sibisi, H. & Cheetham, R. J.** (U Natal, Faculty of Medicine, Durban, South Africa) **Psychiatric problems encountered in urban Zulu adolescents with specific reference to changes in sex education.** *Australian & New Zealand Journal of Psychiatry*, 1974(Mar), Vol 8(1), 41-48.—Compares the sexual and courtship practices of traditional Zulus with those of urban Zulus exposed to Western-oriented culture. More antisocial behavior and social disintegration were manifest in urban youth. It is suggested that the peer group communication and adult inculcation of responsibility practiced by traditional Zulus could be used in all societies to reduce adolescent psychopathology. (43 ref)

959. **Eastwell, H.** (Darwin Hosp, NT, Australia) **Dilemmas of Aboriginal marriage in East Arnhem Land, North Australia.** *Australian & New Zealand Journal of Psychiatry*, 1974(Mar), Vol 8(1), 49-53.—Describes an Aboriginal group with complex marriage customs, including a high degree of polygyny. The introduction of a cash economy produced a loss of traditional roles within the polygynous family and was associated with many cases of psychiatric illness. 9 of these cases are described.

960. **Eister, Allan W. (Ed.).** (Wellesley Coll) **Changing perspectives in the scientific study of religion.** New York, NY: John Wiley & Sons, 1974. xxii, 370 p. \$14.50.—Presents a series of 16 essays in which social scientists describe the adaptation of their theories and methods to the study of religion and religious phenomena. Among the topics discussed are the adequacy of present definitions of religion, faith, and secularity for analyzing religious phenomena; the nature and function of religion in society; the means by which religious institutions are changing to meet the spiritual needs of their followers; and how religious institutions legitimate their positions in a pluralistic society.

961. **Grollman, Earl A.** (Beth El Temple Ctr, Belmont, MA) **The way of dialogue on death between parents and children.** *Religious Education*, 1974(Mar), Vol 69(2), 198-206.—Proposes that children have the right to be included in situations that involve death. Adults reveal maturity when they help the child to realize that as adults they have no final answers concerning death, but that they can talk about it in a mutually advantageous way. Children from 3 to 5 may deny death as a regular and final process; between 5 and 9 they appear able to accept the idea that a person has died but may not understand it as something that will happen to everyone, oneself included. In imparting instruction, honesty is the most important consideration. The best style of explanation is natural and loving. The child should be told immediately of a death of someone close to him, in familiar surroundings whenever possible. Children, like people of any age, respond variously to death. The mental health of both children and adults depends upon the frank acknowledgement of painful separation, that allows for the expression of grief and of

various emotions that come as natural reactions to family disorganization.—E. Gavin.

962. Killen, Pat; Wildman, Robert W. & Wildman, Robert W. II. (Georgia Coll) **Superstitiousness and intelligence.** *Psychological Reports*, (Jun), Vol 34(3, Pt 2), 1158.—Administered an original 57-item superstitiousness questionnaire and the Otis Quick-Scoring Mental Ability Tests to 49 high school seniors. Ss with above average Otis IQs were significantly less superstitious than average-IQ Ss. This effect may have been caused by intelligence directly or by its influence on Ss' social group.

963. Kokonis, Nicholas D. (George Williams Coll) **Three wishes of black American children: Psychosocial implications.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1335-1338.—Investigated the wishes of 63 male and 74 female 7-12 yr old black American children to obtain normative data and to compare these children with other cultural groups. Ss wished for material things more often than anything else, boys tended to wish for money and material things more strongly than girls, and girls were more interested in personal attributes and skills than boys. No developmental trends were noted. Findings are compared with those of studies dealing with white American and Greek and Greek-American children, emphasizing psychosocial change in human development.—*Journal abstract.*

964. Langford, Barbara J. & Langford, Charles C. (U Oregon) **Review of the polls.** *Journal for the Scientific Study of Religion*, 1974(Jun), Vol 13(2), 221-222.—Discusses the results of a national survey of 1,502 persons about church attendance and altruistic behavior conducted by the American Institute of Public Opinion (Gallup poll). Regardless of religious affiliation, those who attended church in the 7 days preceding the survey were more likely than nonattenders to perceive themselves as taking concrete actions on the behalf of others.

965. Lewis, Vern C. (Biola Coll.) **A psychological analysis of faith.** *Journal of Psychology & Theology*, 1974(Spring), Vol. 2(2), 97-103.—Suggests that a deeper analysis of faith can be achieved by examining the concept of attitudes in psychology. Attitudes are shown to have cognitive, affective, and active components. 3 levels of attitudes are also identified: acceptance, preference, and commitment. Several passages of Scripture are presented as evidence that biblical faith also has these same 3 components and levels. It is concluded that moving from the well-researched field of attitudes to a less understood concept such as faith can aid in the understanding of faith. (26 ref)—*Journal abstract.*

966. London, Ivan D. (Brooklyn Coll, City U New York) **The revenge of heaven: A brief methodological account.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1023-1030.—Presents a chronological account of the psychopolitical research that lead to *The Revenge of Heaven: Journal of a Young Chinese*, K. Ling's idiographic study of China's Cultural Revolution. The underlying methodological rationale of using literary techniques and conceptions in group-dependent, as a way of reconstituting perceived reality from the data is discussed.

967. Mack, Delores E. (U Lagos, Nigeria) **The power relationship in black families and white families.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3),

409-413.—Focused on the power relationship in 80 married couples selected to vary by race (40 black and 40 white) and class (40 middle class and 40 working class). Marital power was measured by 3 tasks: a questionnaire, which couples first filled out individually, then jointly; a discussion, in which couples attempted to arrive at a joint statement about 2 topics; and a bargaining situation, which required couples to bargain over 4 items imported from Africa. Results indicate that on only 1 task—completing the questionnaire—was a significant racial or class difference apparent. On that task working-class husbands were significantly more powerful than middle-class husbands.—*Journal abstract.*

968. Roll, Samuel; Hinton, Richard & Glazer, Michael. (U New Mexico) **Dreams of death: Mexican-Americans vs Anglo-Americans.** *Revista Interamericana de Psicología*, 1974, Vol 8(1-2), 111-115.—Tested the hypothesis that Mexican-Americans have more death-related concerns in their reported dreams than their Anglo-American counterparts. 65 Mexican-American and 243 Anglo-American university students of both sexes were given a 48-item questionnaire. The hypothesis was confirmed. (Spanish summary)

969. Rossi, Ino (Ed.). (St John's U, Jamaica, New York) **The unconscious in culture: The structuralism of Claude Lévi-Strauss in perspective.** New York, NY: E. P. Dutton, 1974. xvii, 487 p. \$6.95.—Presents a collection of 19 theoretical and discussion papers on structural anthropology as formulated by C. Lévi-Strauss. The papers (a) attempt to clarify the theoretical and methodological premises of structuralism; (b) suggest various types of ethnological applications and ways to strengthen the procedures of structural analysis; and (c) compare it with empirical, cybernetic, Marxist, and existential approaches.

970. Rush, John A. **Witchcraft and sorcery: An anthropological perspective of the occult.** Springfield, IL: Charles C Thomas, 1974. ix, 166 p.—Presents a discussion of the history and theory of, and research on, the occult in Europe, Africa, the Americans, and Asia. The relationships between witchcraft, religion, sorcery and magic, and between the occult and psychotherapy are discussed, and data on Italian witchcraft and sorcery obtained from a 4-yr study of an Italian kinship network in Canada are presented. (7 p ref)

971. Simmons, Dale D. (Oregon State U) **Personal values of university students in Mexico and in Oregon.** *Revista Interamericana de Psicología*, 1974, Vol 8(1-2), 103-110.—Administered the Simmons Value Survey, consisting of 100 inventory statements, to 3 groups: (a) 111 students of the Preparatoria program at Guadalajara University, (b) 41 students of the Facultad de Filosofía y Letras program at Guadalajara University, and (c) 199 General Psychology students at Oregon State University, to assess cross-cultural differences in personal values. Results were as follows: (a) In spite of many significant differences between the groups, the overall priority systems of the groups were significantly correlated, so that all 3 groups could be considered subsamples of the same population. (b) The groups showed no significant difference in the overall level of valuing. (c) Sex differences were negligible, indicating no need to establish separate norms for each sex. (d) D. Guerrero's

distinction between the "active" and the "passive" syndromes for the US and Mexican population, respectively, was not well supported. (Spanish summary) (19 ref)—*S. Slak*.

972. Walters, Annette. (St Ambrose Coll) **Religious education, values, and morals.** *Religious Education*, 1974(Mar), Vol 69(2), 246-248.—Suggests that only 3 schools of psychology, and their derivatives, have made important contributions to moral education: the psychoanalytical, the behavioristic, and the cognitive. Behavioristic and cognitive theory need to be supplemented with the depth psychology of Freud and Jung, which has mistakenly been associated with moral permissiveness. While all 3 schools of psychology have made some contributions to moral education, it is concluded that their complementary insights could also benefit from the perspectives of religious educators. —*E. Gavin*.

973. Zentner, Henry. (U Calgary, Faculty of Education, Alberta, Canada) **Profiles of the supernatural: Inquiries into the socio-psychological foundations of religious behavior.** Calgary, Canada: Strayer, 1972. xxvi, 120 p. \$7.50(cloth), \$3.25(paper).—Examines the similarities and differences between Catholicism, Calvinistic Protestantism, and Canadian Indian Animism. The manner in which these religious communities have helped their adherents find and maintain a sense of personal identity and integrity is explored. The relationship of their differing modes of religious training and of defining reality to behavior in worship, mental health, education, and social organization is discussed.

#### Social Issues & Social Processes

974. Aldous, Joan. (U Georgia) **The making of family roles and family change.** *Family Coordinator*, 1974(Jul), Vol 23(3), 231-235.—Discusses the concept of role-making, the process of behavioral experimentation in which persons assume the viewpoints of another in various interaction patterns. The characteristics of this process in marriage and family situations, where gender roles and identities are becoming increasingly diffuse, is noted. It is suggested that marriage counselors who work with couples in conflict should understand how the changing nature of family roles may affect the marriage and should encourage couples to base roles on competency, time available, and interest, rather than on gender. The consequences of inappropriate role-making and the problems of special types of families (e.g., 1-parent families) are considered, and it is emphasized that both community, psychological, and dynamic influences should be examined before changes in family patterns based on role-making are adopted. —*L. Gorsey*.

975. Astin, Helen S.; Suniewick, Nancy & Dweck, Susan. **Women: A bibliography on their education and careers.** New York, NY: Behavioral Publications, 1974. v, 243 p. \$10.95.—Presents a collection of over 350 abstracts and annotations of the research literature on the educational and occupational status of women. Topics include determinants of careers, the history and economics of women in the work force, the marital and familial status of working women, developmental studies, and the role of continuing education in women's careers.

976. Baizerman, Michael; Sheehan, Cynthia; Ellison, David L. & Schlesinger, Edward R. (U Minnesota, Ctr for Youth Development & Research) **A critique of the research literature concerning pregnant adolescents, 1960-1970.** *Journal of Youth & Adolescence*, 1974(Mar), Vol 3(1), 61-75.

977. Braga, Joseph & Braga, Laurie. (U Miami, Medical School) **Growing with children: The early childhood years.** Englewood Cliffs, NJ: Prentice-Hall, 1974. xiii, 205 p.—Details the needs, capabilities, and limitations of children from birth to 6 yrs of age, and presents methods of behavior management and practical suggestions for childrearing. (45 ref)

978. Brooks, Glenwood C.; Sedlacek, William E. & Mindus, Lester A. (U Maryland, Cultural Study Ctr) **Interracial contact and attitudes among university students.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Jan), Vol 1(2), 102-110.—Conducted an attitudinal and demographic poll of 1,391 undergraduates at a large state university, 84% of whom were white. Results show that 39% of the freshmen indicated they had no close friends of another race, with upperclass responses showing a similar pattern. Most black Ss reported having spent most of their lives in the city, whereas Ss from the other groups (white, Oriental, Spanish-American, and American Indian) indicated they had spent most time in the suburbs. Only 9% of all Ss disagreed that it would be enjoyable to have a roommate of another race, and no sex differences or Sex  $\times$  Race interactions were observed in responses. Data indicate the existence of a cultural parallelism among students from various minority groups, and emphasize the need for continued interracial contact. —*L. Gorsey*.

979. Calhoun, James F. (State U New York, Stony Brook) **Attitudes toward the sale and use of drugs: A cross-sectional analysis of those who used drugs.** *Journal of Youth & Adolescence*, 1974(Mar), Vol 3(1), 31-47.—Surveyed attitudes about the sale and use of drugs among 117 junior high school students, 73 senior high school students, 92 undergraduates, 39 parents of the high school students, 40 university staff members, and 38 junior and senior high school teachers. All Ss completed a 2-part questionnaire about attitudes toward the use and sale of drugs (tobacco, alcohol, marihuana, heroin, barbiturates, amphetamines, hallucinogens, and cocaine) and their actual use of these drugs. The larger proportion of users of each drug was made up of secondary and college students, especially marihuana and hallucinogens. Adults contributed more to the barbiturate, amphetamines, tobacco, and alcohol user groups. Users considered the drugs they used to be better (i.e., safer, less addictive, or less harmful) than randomly selected respondents. Users of hallucinogens, amphetamines, and barbiturates tended to use more of all drugs than users of marihuana, tobacco, or alcohol. —*L. Gorsey*.

980. Carman, Roderick S. (U Wyoming) **Values, expectations, and drug use among high school students in a rural community.** *International Journal of the Addictions*, 1974, Vol 9(1), 57-80.—Administered a personal values questionnaire, based on Rotter's social learning theory of personality, and a drug use survey to 327 9th-12th graders in a rural high school. It was

hypothesized that Ss who manifest low freedom of movement, characterized by low expectations of achieving valued goals, would be more likely to report heavier drug use, more frequent periods of intoxication, and greater social complications resulting from drug use. Results support the hypothesis, in that low freedom of movement in the goal area of recognition-achievement was correlated with drug use, especially in the case of barbiturates and hallucinogens.—*L. Gorsev.*

981. **Coblner, W. Godfrey.** (Albert Einstein Coll of Medicine, Yeshiva U) **Pregnancy in the single adolescent girl: The role of cognitive functions.** *Journal of Youth & Adolescence*, 1974(Mar), Vol 3(1), 17-29.—Conducted interviews with 211 single adolescent girls, free of known psychiatric disturbance, who had undergone an elective abortion at a metropolitan municipal hospital. The extent to which Ss were acquainted with birth control methods and had actually attempted to avoid their pregnancy was assessed. Similar data relating to birth control were obtained in interviews with a group of 200 single adolescents pregnant for the 1st time, and from 50 girls serving as controls who had effectively practiced birth control for at least 6 mo. The great majority of the girls came from the same socioeconomic background, close to the subsistence level. Results indicate that about 75% of the pregnancies were unintended. 3 psychological cognitive mechanisms were uncovered which virtually blocked the conversion of birth control knowledge into its successful practice. This finding suggests that adolescent out-of-wedlock pregnancies do not exclusively arise from motivational factors. (23 ref)—*Journal abstract.*

982. **Cuber, John F.** (Ohio State U) **Sex in the upper middle class.** *Medical Aspects of Human Sexuality*, 1974(Jul), Vol. 8(7), 8-34.—Discusses characteristics of the behavioral structure of the upper middle class and suggests that career demands made on upper-middle-class couples adversely affect their sex lives. An anthropology professor's discussion of the article is also included, which further clarifies the effects of social mobility, status inconsistency, and ethnic subculture on sexual behavior.

983. **Cullen, Francis T.** (Teachers Coll, Columbia U) **Attitudes of players and spectators toward norm-violation in ice hockey.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1146.—Administered a 4-item attitude questionnaire on rule-breaking just prior to the start of a game to 18 college hockey players and 46 undergraduate spectators (20 females). Data indicate that (a) both the players and the spectators generally approved of norm-violation, (b) player approval was greater than that of male and female spectators, and (c) male spectator approval was greater than that of female spectators.

984. **De Nicola, Pietro & Peruzza, Marino.** (U Pavia, Italy) **Sex in the aged.** *Journal of the American Geriatrics Society*, 1974(Aug), Vol 22(8), 380-382.—Analyzes sexual activity and habits in the aged on the basis of the pertinent literature and on personal observations of 53 male and 32 female 62-81 yr old Ss. The importance of diseases and of environmental, social, and psychological factors is discussed in connection with impairment of sexual activity in old people. It is concluded that sexual activity in the aged is not exceptional and may give

serenity to aging. Medical, social, and psychological prophylactic counseling should be applied as early as possible by geriatricians in collaboration with sexologists.—*Journal abstract.*

985. **DiRenzo, Gordon J.** (U Delaware) **Personality and politics.** Garden City, NY: Anchor, 1974. xv, 539 p. \$3.50.—Presents a collection of 20 papers on the relationship of personality and politics, including psychological motivations in recruitment to political roles and careers, personality types among politically active persons, the relationship of personality to specific political ideologies, the interaction of personality and various political dynamics, and methodological and theoretical issues in the study of the psychology of politics. (23% p ref)

986. **Fallding, Harold & Miles, Carol.** (U Waterloo, Ontario, Canada) **Drinking, community and civilization: The account of a New Jersey interview study.** New Brunswick, NJ: Rutgers Center of Alcohol Studies, 1974. xvii, 73 p. \$6.—Presents a typology of drinking constructed from interviews with residents of 2 New Jersey communities during a long-term study. 4 types of drinking—community-symbolic, facilitative, assuagement, and retaliative—are defined, and each is considered in terms of its cultural significance. (40 ref)

987. **Farley, Frank H. & Farley, Sonja V.** (U Wisconsin, Madison) **Birth order and political orientation in college women.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1045-1046.—Only-child, firstborn, and later-born groups of female undergraduates completed global self-ratings of conservatism-liberalism. Results do not support the hypothesis that conservatism is related to birth order.

988. **Farnsworth, Dana L.** (Harvard U) **The young adult: An overview.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 845-851.—Describes changes in the attitudes and behavior of young adults over the past 2 decades, including disaffection on the college campus, the new conservatism, countercultural life-styles, drug use and abuse, and changing codes of sexuality. The need for young adults and their elders to work together toward the solution of problems in a society where personal integrity is considered to have declined alarmingly is emphasized. (18 ref)

989. **Ferguson, Ben & Kennelly, Kevin.** (North Texas State U) **Internal-external locus of control and perception of authority figures.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1119-1123.—To investigate differences between internal and external Ss' characteristic views of figures in authority, the Authority Figure Perception Test, a paper-and-pencil test, was constructed (scale reliabilities ranged from .82 to .33) and administered along with Rotter's Internal-External Control Scale to 76 14-18 yr old male preparatory high school students. As hypothesized, internals more than externals perceived figures in authority (a) as more encouraging of constructive environmental manipulations, (b) as more supportive when difficulty was encountered, (c) as more positively reinforcing, (d) as having more predictable standards, (e) as acting more upon issue-oriented reason, and (f) in a generally more positive light. As age increased, there was a decrease in the tendency to perceive authority figures as positively reinforcing, as

having predictable standards, and in a generally positive light.—*Journal abstract.*

990. Fisher, Allan H. & DiSario, Martha R. (Human Resources Research Organization, Alexandria, VA) **Attitudes of youth toward military service in a zero-draft environment: Results of a national survey conducted in November 1972.** Alexandria, VA: Air Force Human Resources Lab, Manpower Development Branch, MR 74-8, 1974. 108 p.—Results of a survey of 1,924 16-21 yr old males indicate that high school students had a higher enlistment potential than college students or males not in school and that a fully paid college education was the greatest enlistment incentive, especially to 16-17 yr olds.

991. Fisher, Gary & Brickman, Harry R. (Cedars-Sinai Medical Ctr, Los Angeles, CA) **Multiple drug use of marihuana users.** *Diseases of the Nervous System*, 1973(Jan), Vol 34(1), 40-43.—Studied illicit nonmedical use of 6 classes of drugs (alcohol, stimulants, psychedelics, tranquilizers, barbiturates, and hard narcotics) by 530 users and 573 nonusers of marihuana. Regular use of all 6 drugs was minimal, alcohol being the drug used most regularly by all respondents. Those who used marihuana daily also used the other drugs more frequently.—*M. Oscar-Berman.*

992. Fisher, Gary & Steckler, Allan. (Cedars-Sinai Medical Ctr, Los Angeles, CA) **Psychological effects, personality and behavioral changes attributed to marihuana use.** *International Journal of the Addictions*, 1974, Vol 9(1), 101-126.—Administered a 220-item questionnaire on marihuana use and its effects to 524 16-66 yr old Ss, classified according to use pattern: trial, past, occasional, regular, and daily users. Ss reported the occurrence of 33 psychological effects of marihuana, changes on 14 behavioral and personality variables, the effects on alcohol and tobacco consumption, effects on sexual activity, and reasons for marihuana use. Results indicate that as marihuana use increases, there are increases in pleasurable effects and beneficial results in personality and behavioral areas and decreases in negative and unexpected consequences. Trial users reported the least pleasant effects and the greatest untoward effects, and past users reported considerably less benefits than current users. The primary reason given for using marihuana was "to have fun." (18 ref) —*Journal abstract.*

993. Fochtman, Dianne. (Children's Memorial Hosp, Chicago, IL) **A comparative study of pediatric nurses' attitudes toward death.** *Life-Threatening Behavior*, 1974(Sum), Vol 4(2), 107-117.—Administered a 24-item questionnaire on attitudes toward death and the care of dying patients to 47 professional and 10 nonprofessional pediatric nurses in 3 hospitals. There were no significant differences among Ss in education, background, or previous clinical experience. There were significant differences between Ss who worked on terminal wards and those who worked on either benign or acute wards in their attitudes toward the prolongation of life and their degree of composure in situations with dying children and their families.—*Journal abstract.*

994. Fröhlich, Hans H. (Humbolt U Berlin, Jurisprudence Section, E Germany) **[The significance of sexual knowledge, interests and pre-existing experiences for**

**the special credibility of the witness personality.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jan), Vol 26(1), 25-32.—Comments on significance of factors affecting the credibility of minors as witnesses in sexual crimes. Child and adolescent witnesses often admit considerable personal sexual experience.—*K. J. Hartman.*

995. Gallogly, Frances D. **Housing decisions in selecting a residence in a planned townhouse development.** *Home Economics Research Journal*, 1974(Jun), Vol 2(4), 251-261.—Studied the process by which families decide to move to a planned townhouse community, using a decision-making model involving predictor, selection process, and outcome of move variables. Housing space was of primary importance in decisions to move, along with the physical appearance of the neighborhood and recreational facilities available. Problems and appeals of new planned communities are discussed. (17 ref)

996. Gardner, Elmer A. **Implications of psychoactive drug therapy.** *New England Journal of Medicine*, 1974(Apr), Vol 290(14), 800-802.—Discusses recent data which indicate, contrary to popular belief, that the US is not a greatly overmedicated society which abuses antianxiety/sedative drugs and that physicians are generally cautious in prescribing drugs of this type. The increasing use of drugs to control behavior and alleviate uncomfortable symptoms will require greater public attention and scrutiny, and studies which continually monitor prescription rates and drug consumption will aid in establishing policies relevant to preventing the abuse of these drugs.—*L. Gorsey.*

997. Helfgot, Joseph. (State U New York, Stony Brook) **Professional reform organizations and symbolic representation of the poor.** *American Sociological Review*, 1974(Aug), Vol 39(4), 475-491.—Examined the changes and sources of change in Mobilization for Youth, a well-known professional reform organization emphasizing the interplay of change-oriented goals with their environment. The extent and forms of 2 goals, militant community action and indigenous participation, were traced throughout the organization history, and a distinction was made between various interpretations of participation and the concept "indigenous." To maintain the organization its goals were changed many times. Maintenance was aided by the recruitment of professionalized, middle-class, minority group members, taken as being the equivalent of the poor. A feature of professional reform organizations is just such symbolic representation. Several interpretations of these results in terms of other government-sponsored reform movements are discussed. (38 ref)—*Journal abstract.*

998. Jakobi, L. & Marquer, P. (Musée de l'Homme, Ctr of Anthropological Research, Paris, France) **[Study of the relations between matrimonial matching and exogamy for two groups of French couples.]** (Fren) *Biométrie Humaine*, 1973(Mar), Vol 8(1-2), 21-37.—Reports a study of 238 French married couples from endogamous groups (in which individuals are restricted to marriage within the group) compared with 132 exogamous couples (not thus restricted), both groups from agricultural areas of Brittany and Bearn. Anthropometric and social data were compiled and correlated.

and similarities and differences between the groups are reported. (English summary)—*B. L. Kintz.*

999. Kentsmith, David K. (U Nebraska, Medical School, Psychiatric Inst. Omaha) **The rape of the lock revisited.** *Psychiatric Quarterly*, 1973, Vol 47(4), 571-585.—Reviews the significance of hair in history and legend and considers the impulses which lead young American males to wear long hair. It is concluded that the projective reaction of adults to long hair on an adolescent male is "the result of an intensive challenge to the success of repression by an adult of his own primitive drives, both aggressive and sexual."

1000. Khandekar, Mandakini. (Tata Inst of Social Sciences, Unit for Study of the Urban Child & Youth, Bombay, India) **A study of drop-outs.** *Indian Journal of Social Work*, 1974(Jan), Vol 34(4), 367-385.—Describes a study of socioeconomic and environmental characteristics of 14-21 yr old dropouts from a secondary education. Among the items examined were the educational background of the dropouts (DO) and of other children in the household, the factors which contributed to dropping out, the extent of the DO's knowledge of educational and vocational training opportunities, their motivation for such training, and their reactions to rehabilitation programs. Preliminary findings are discussed.

1001. Kolb, Douglas; Gunderson, E. K. & Nail, Richard L. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **Pre-service drug abuse: Family and social history characteristics.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 278-282.—Administered a personal history and drug use questionnaire to 903 enlisted men at a US Navy drug rehabilitation center. Illegal use of 6 types of drugs (cannabis, hallucinogens, opiates, stimulants, hypnotics, and cocaine) before entrance into the service was assessed, and 4 levels of preservice drug involvement were defined (low, low average, high average, and heavy). There were 468 nonusers. Results show that (a) heavy preservice drug use was associated with manifestations of disturbed family relationships (e.g., running away, negative relationships with fathers, and leaving home at an early age); (b) heavy use was also associated with a history of antisocial behavior in the community and poor school adjustment; and (c) heavy preservice users exhibited a pattern of fiscal irresponsibility and histories of outpatient psychiatric or psychological treatment. There was no relationship between preservice drug use and any major health problem preceding the year of entry into the service or between drug involvement and emotional disorders among siblings. Socioeconomic status was not a major factor in drug use.—*L. Gorsey.*

1002. Krisberg, Barry. (U California, School of Criminology, Berkeley) **Gang youth and hustling: The psychology of survival.** *Issues in Criminology*, 1974(Spr), Vol 9(1), 115-131.—Reports the results of interviews and observations conducted among 22 18-23 yr old black gang leaders in Philadelphia. All leaders were high school dropouts, and their combined arrest records totalled more than 175 contacts with the law, primarily for offenses involving violence, weapon use, and assaultive behavior. The theme of survival in the activities of the gang leaders is predominant; survival becomes a

functional adaptation to an uncompromising social environment. The world views of the leaders incorporate this psychology of survival into beliefs in strict determinism as an explanation of human behavior, a pragmatic and conservative view of human nature, and a refusal to make plans for the future. The effects of an "urban leadership training" program on the outlook and lifestyles of these gang leaders are examined, and reasons for the program's failure are suggested. (19 ref)—*L. Gorsey.*

1003. Larsen, Jean P. & White, Barbara A. (Pocatello School District, ID) **Comparison of selected perceptual and personality variables among college men, deviant and non-deviant in hair length.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1315-1318.—Administered the Security-Insecurity Inventory, the Rod-and-Frame Test, and the Survey of Interpersonal Values to 30 male undergraduates with hair below the shoulders (deviant) and 30 with hair above the shoulders (nondeviant). Significant differences were found between the 2 groups, deviants were more field independent and placed a greater value on Independence and a lesser value on Conformity and Recognition than nondeviants. No differences were found between the 2 groups on the security-insecurity dimension.—*L. Gorsey.*

1004. Lasswell, Marcia E. (California State U, Pomona) **Is there a best age to marry? An interpretation.** *Family Coordinator*, 1974(Jul), Vol 23(3), 237-242.—Discusses research on the average ages of people who marry for the first time, the correlation between age at marriage and success of the marriage, and the age at marriage as it relates to the establishment of a family. Social influences on the trend to marry at a later age are also examined (e.g., Women's Liberation, economic prosperity, and freer attitudes toward sex). When all data are considered, it appears that a successful marriage is best achieved when women are 25 and men are 28; they should not have children until 2 to 3 yrs later. These ages are considerably later than the most popular age for marriage (23 for men and 20 for women), a factor which may contribute to the high divorce rate.—*Journal abstract.*

1005. Levenson, Hanna. (Texas A&M U) **Involvement in antipollution activities and perceived negative consequences from pollution.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1105-1106.—Administered an involvement activities checklist and a measure of the perceived importance of the issue of pollution to 96 male and female members and nonmembers of an antipollution group. Members considered pollution a significantly higher priority problem and believed to a greater degree that they would be negatively affected by pollution than did nonmembers.

1006. Lunneborg, Patricia W. (U Washington) **Validity of Attitudes toward Women Scale.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1281-1282.—Found that the Attitudes toward Women Scale was sensitive to differences between northern and southern college samples and to differences in a northern group exposed to a course on psychology of sex differences. Compared to the normative sample, women grew even more liberal, and original differences between men and women disappeared.

1007. **Marin, Gerardo**. (U de los Andes, Bogota, Colombia) [Psychosocial aspects of the use of marihuana.] (Span) *Revista Interamericana de Psicología*, 1974, Vol 8(1-2), 117-124.—Reviews literature on personality, psychosocial and sociodemographic factors, and differences between users and nonusers of marihuana. Theories dealing with this problem are evaluated. (50 ref)

1008. **Mazis, Michael B.; Settle, Robert B. & Leslie, Dennis C.** (U Florida) **Elimination of phosphate detergents and psychological reactance.** *Journal of Marketing Research*, 1973(Nov), Vol 10(4), 390-395.—Administered a questionnaire about attitudes toward laundry detergents, laws regulating the use of phosphates, and demographic characteristics to 76 housewives in Miami, Florida, and to 45 Ss in Tampa (control). Based on reactance theory, it was hypothesized that Miami consumers, who were prohibited by law from buying products containing phosphates, would have more positive attitudes toward the effectiveness of phosphate detergents than consumers living in an area where phosphates were for sale (Tampa housewives), and that Miami consumers would have more negative attitudes toward governmental water pollution measures and laws against phosphate detergents than the consumers unaffected by the phosphate ban. Findings support the hypotheses and also show that Ss forced to switch from their favorite detergent were less favorable about the effectiveness and cost of the no-phosphate vs phosphate detergents than were consumers who were able to maintain brand continuity.—*L. Gorsey*.

1009. **McCutcheon, Lynn E.** (Catholic U of America) **Development and validation of a scale to measure attitude toward population control.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1235-1242.—Describes the development of the Population Opinion Poll (POP), a Likert-type scale designed to measure attitudes toward population control. Its reliability and validity are described, based on data from 376 college students. Significant correlations were obtained between Ss' POP scores and scores on scales measuring social, religious, and birth-control attitudes. (16 ref)—*Journal abstract*.

1010. **Menninger, W. Roy**. (Menninger Foundation, Topeka, KS) **Decisions in sexuality: An act of impulse, conscience, or society?** *Medical Aspects of Human Sexuality*, 1974(Jun), Vol 8(6), 56-91.—Presents a psychoanalytically-oriented discussion of the complex forces that affect decisions about sexual behavior. Sexual anxiety in young adults and adolescents, the role of unconscious and conscious conflict in sexual decision making, sex as an expression of nonsexual motivations and feelings, and the defenses and strategies used by persons who must make these decisions are examined. It is concluded that the anxiety felt in making a sexual decision is more than a problem of guilt, that sexual relationships often embody many of one's ideas about himself, and that the interplay of biological, social, and psychological forces which mediate sexual behaviors may be better understood if discussion groups are made an important component of the counseling process. 4 commentaries on the article are included.—*L. Gorsey*.

1011. **Merenda, Peter F. & Shapurian, Reza**. (U Rhode Island) **English students' perception of Heath and ideal self.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3,

Pt 2), 1207-1210.—Asked 50 English university students to give their perceptions of Prime Minister Heath and of their ideal self using the Activity Vector Analysis. 2 distinct clusters were noted which correspond closely to previously obtained perceptions of national leaders vs the ideal self-concept. Mean vectors for the Heath vs ideal self clusters were essentially uncorrelated ( $r = -.17$ ).—*Journal abstract*.

1012. **Miller, Alma G.** (Acadia U, Wolfville, Nova Scotia, Canada) **The relationship between family interaction and sexual behavior in adolescence.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 285-288.—Videotaped the discussions of 9 families with unmarried pregnant daughters and 7 families with daughters who were members of a community organization (Girl Scouts). Each segment of the videotaped interaction was classified into 1 of 12 categories (e.g., agreement or disagreement), using Bales interaction process analysis. The 2 types of families did not differ on daughter's age, parents' ages, social class, family size, or religion, but the daughters did differ on birth order and school grades. Data support several distinctive patterns in families of unwed mothers which were identified from the clinical literature, including powerful mother, passive father, daughter excessively involved with mother, and negative interactions.—*L. Gorsey*.

1013. **Morrow, Gary R.; Clarke, Walter V. & Merenda, Peter F.** **Perception of role of the President: A nine-year follow up.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1259-1262.—Administered the Activity Vector Analysis to 31 16-43 yr old college students matched for age and sex with a 1964 sample surveyed by P. F. Merenda (see PA, Vol 39:7611) to assess the words which they felt described the kind of person the President of the United States should be. Comparisons of the resulting cluster with the previously obtained data show that there has been a slight change in the stereotyped perception of the ideal president in that the new ideal is generally less opinionated and decisive as well as more receptive and appreciative of another person's point of view than was previously found.—*Journal abstract*.

1014. **Murphy, H. B.** (McGill U, Montreal, Quebec, Canada) **Theories of youth unrest in cross-cultural perspective.** *Australian & New Zealand Journal of Psychiatry*, 1974(Mar), Vol 8(1), 31-40.—Reviews the literature on the adolescent protest movement in different societies. It is concluded that most of these movements cannot be explained in terms of 1 theory of adolescence, but that their behavioral aspects can be explained by a combination of the psychoanalytic theory of adolescent sexuality, sociological role theory, and the theory of the hierarchy of needs. (60 ref)

1015. **Pierson, Elaine C. & D'Antonio, William V.** (U Pennsylvania, Student Health Service) **Female and male: Dimensions of human sexuality.** Philadelphia, PA: J. B. Lippincott, 1974. ix, 349 p. \$8.95(cloth), \$5.95(paper).—Presents an introduction to the anatomy, physiology, and psychology of sexual behavior, intended for young adults. Sexual dysfunctions, reproduction, contraception and abortion, factors in premarital and nonmarital sex, marriage, and adolescent sexual behavior and concerns are discussed. (7 p ref)

1016. Pliner, Patricia & Cappell, Howard. (Erindale Coll, U Toronto, Mississauga, Ontario, Canada) **Modification of affective consequences of alcohol: A comparison of social and solitary drinking.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 418-425.—Tested 2 predictions based on S. Schachter's 1964 theory of emotion regarding the interaction of alcohol consumed in social and solitary situations. Ss were 60 male and 60 female 18-30 yr old adults. It was predicted that the cognitive circumstances of social drinking would promote an affective response to alcohol, whereas the same objective level of intoxication would be responded to as physical symptoms among solitary drinkers. Additionally, it was predicted that the social manipulation would be effective only to the extent that "plasticity" was induced (i.e., only when alcohol and not placebo was consumed). Both predictions were generally confirmed, using self-report of mood and O ratings of amusement as dependent variables. It is conjectured that the social circumstances of drinking may be important in determining the reinforcing value of the intoxicated state. (15 ref)—*Journal abstract*.

1017. Preston, Samuel H. (U Washington) **Differential fertility, unwanted fertility, and racial trends in occupational achievement.** *American Sociological Review*, 1974(Aug), Vol 39(4), 492-506.—Estimated the effects on future occupational achievement and mobility levels of maintaining current class differences in fertility. Separate computations were made for the white and nonwhite populations, under the assumption that both groups will be subject to the mobility regime of all men recorded in the 1962 Current Population Survey (mean age = 43.3 yrs). Because fertility differentials are larger in the nonwhite population, maintaining them has a greater impact on this group. Differential fertility reduces the proportion of nonwhite men in the top 3 occupational groups by 10-11% in the 2nd generation and beyond, and raises the proportion in the bottom 3 groups by 21-23%. Eliminating unwanted fertility from recorded class differences largely removes the effect of differential fertility on occupational distributions. (25 ref)—*Journal abstract*.

1018. Quarter, Jack. (Ontario Inst for Studies in Education, Toronto, Canada) **Political socialization at the University of Toronto: A three-year longitudinal study.** *Canadian Journal of Behavioural Science*, 1974(Jul), Vol 6(3), 219-233.—Analyzed change in the political orientation of 248 male students between their entrance and departure from a Canadian university; the characteristics related to change were also examined. These investigations were conducted in 2 settings—a laboratory where artificial conditions were set up to induce a change in attitudes and a natural field setting where changes in attitudes were viewed over a 3-yr period. Although results provide partial support for the hypothesis that Ss would be radicalized by their university experience, the change in attitudes was small. Reasons for the small amount of change are discussed. (French summary) (28 ref)—*Journal abstract*.

1019. Ray, Rose E. & Thompson, William D. (Purdue U) **Autonomic correlates of female guilt responses to erotic visual stimuli.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1299-1306.—Investigated the interaction

between the personality trait of sex guilt and types of sexual stimuli and their effect on heart rate and the galvanic skin response (GSR). 60 undergraduate women were divided into high sex-guilt and low sex-guilt groups on the basis of their responses to Mosher's True-False Guilt Inventory. 10 high sex-guilt and 10 low sex-guilt Ss were randomly assigned to each of 3 experimental stimuli. All Ss responded with significantly greater GSRs when viewing the masturbatory and coital stimuli than they did while viewing the dating stimulus. Low sex-guilt Ss exhibited a significant cardiac deceleration when viewing the coital stimulus, while high sex-guilt Ss exhibited a nonsignificant cardiac acceleration to the same stimulus. (27 ref)—*Journal abstract*.

1020. Reich, Wilhelm. **The function of the orgasm: Sex-economic problems of biological energy: Volume I of The Discovery of the Orgone.** (Trans Vincent R. Carfagno). New York, NY: Touchstone, 1973. viii, 400 p. \$3.95.—Presents the core of W. Reich's search for a single basic, universal force underlying life and creation. Reich's medical and scientific study of the human organism over a period of 20 yrs is summarized, and the development of this work from psychology into biology and into the discovery of the cosmic orgone energy is traced.

1021. Rohrbaugh, Michael & Eads, Gerald. (U North Dakota) **Effects of the Vietnam experience on subsequent drug use among servicemen.** *International Journal of the Addictions*, 1974, Vol 9(1), 25-40.—Data from 3 groups of 1,743 active duty servicemen surveyed in 1971 at a midwestern military installation provided only limited evidence that service in Southeast Asia affected subsequent drug use. The reported incidence of opiate use in the presurvey month was higher for Vietnam returnees than for nonreturnee controls from the same units on only 1 of 3 surveys.

1022. Rosenblum, Jay A. (New York U, Medical School) **Human sexuality and the cerebral cortex.** *Diseases of the Nervous System*, 1974(Jun), Vol 35(6), 268-271.—Reviews the literature on the physiological relationships between the cerebral cortex and various aspects of sexual behavior and experience. Evidence indicates that there is a link between the temporal lobes and sexual behavior. Cases of temporal lobe epilepsy associated with sexual disorders (e.g., impotency and hyposexuality) are reviewed. Important issues and problems in this research field are discussed, including the meaning of deviant sexual behavior and the lack of basic criteria and definitions of impotency and hyposexuality.—A. Olson.

1023. Sorrentino, Richard M.; Vidmar, Neil & Goodstadt, Michael S. (U Western Ontario, London, Canada) **Opinion change in a crisis: Effects of the 1970 Canadian kidnapping crisis on political and ethnic attitudes.** *Canadian Journal of Behavioural Science*, 1974(Jul), Vol 6(3), 199-218.—Conducted a total of 7 surveys with 2 separate sample populations (310 English-Canadian residents and 595 Canadian college students) before, during, and after the Canadian kidnapping crisis of 1970, in which a militant French separatist group kidnapped 1 English and 1 Canadian official. While no long-term effects on opinions towards French Canadians or the government's use of restrictive measures were

observed, results show considerable short-term changes in opinions during the height of the crisis. Ss increased their support of any action which was or could be taken by the government in order to deal with the crisis; they also tended to obscure differences between those directly or indirectly involved with the crisis. Other reactions to the crisis as well as the methodological implications of the study are discussed. (French summary) (18 ref) —*Journal abstract.*

1024. Stoeckeler, Hazel S. & Hasegawa, Minoru. (U Minnesota, St Paul) **A technique for identifying values as behavioral potentials in making consumer housing decisions.** *Home Economics Research Journal*, 1974(Jun), Vol 2(4), 268-280.—Describes a technique for measuring and interpreting individual hierarchies of values and for identifying individuals as types according to their values. 207 female undergraduates in 3 sections of a beginning course in housing, 169 of their parents, and 74 young males of the student's choice were administered pre- and posttest questionnaires assessing the relative importance of 9 sociopsychological variables in both personal orientation and housing decisions. The scoring system is based on a computer analysis of response hierarchies and cross-classified data. Data (a) suggest that this methodology can provide a means for gathering individual and group data on values and for identifying behavioral potentials in making consumer decisions and (b) confirm the existence of housing value groups. The importance of "economy" and "family centrism" in housing value hierarchies as previously reported was also supported. (21 ref)—*Journal abstract.*

1025. Toldson, Ivory L. (Temple U) **The human potential movement and black unity: Counseling Blacks in groups.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Jan), Vol 1(2), 69-76.—Discusses how the human potential movement is oriented almost entirely to white problems and how it promotes racism and the negative aspects of capitalism. It is suggested that, if revamped, the movement may be helpful in restoring and furthering black unity by organizing "black identity groups" for helping blacks to recognize their individuality and their African heritage.

1026. Turner, Barbara F. & Kahn, Robert L. (U Massachusetts, School of Education, Amherst) **Age as a political issue.** *Journal of Gerontology*, 1974(Sep), Vol 29(5), 572-580.—Studied attitudes toward aging, chronological age, and the role of age as a political issue in a primary election contest between 2 candidates of similar ideology but markedly different ages—a 40-yr-old challenger vs an 84-yr-old incumbent. Interviews were obtained during the weeks preceding the election with 256 respondents, drawn from middle-class areas in the election district. It was found that attitudes toward aging, measured by semantic differential, became more favorable as age of respondent increased. Despite this, candidate preference was not related to age. Preference for the younger man was related to negative attitudes toward the age of the older candidate and to perception of age as a salient campaign issue. Opinions regarding each candidate reflected primarily a strong bias for the preferred candidate. It is concluded that the age of the 2 men did not in itself substantially influence candidate preference.—*Journal abstract.*

1027. Uricchio, William A. & Williams, Mary K. (Carlow Coll) **Proceedings of a research conference on natural family planning.** Washington, DC: Human Life Foundation, 1973. xxv, 316 p.—Includes topics on biorhythms; gamete survival and effects of aging; US clinical experiences; prediction, detection, and control of ovulation; psychological and sociological implications; and method effectiveness evaluation in family planning.

1028. West, Ranyard. **International law and psychology: 2 studies: The intrusion of order, Conscience and society.** Dobbs Ferry, NY: Oceana Publications, 1974. xxvii, 260 p.—Presents 2 theoretical discussions of psychology, political philosophy, social ethics, and human nature. Topics and concepts discussed include the roots of prejudice, reactions to power, law vs sovereignty, critical episodes in modern history, current issues in the psychology of politics, psychological theories of human nature, the nature of loyalty, and the role of social organization in international law.

1029. Wogan, Michael. (U Connecticut) **Illicit drug use among college students.** *College Student Journal*, 1974(Apr), Vol 8(2), 56-62.—Summarizes some of the data pertaining to the use of illicit drugs among college students. According to J. L. Anker (1971), the following percentages of lower-classmen (freshmen and sophomore students) have used the indicated drugs on one or more occasions: marihuana, 55%; amphetamines, 19%; hallucinogens, 16%; barbiturates, 12% and opiates, 7%. Drug usage was positively associated with the higher social classes. Drugs seem to be used most frequently by students in large private liberal arts colleges, then (in descending order of frequency) by those in private universities, major state universities, smaller state universities, small colleges, and junior colleges. Agnostics and atheists reported the most frequent usage, followed by persons claiming adherence to an Eastern religion, Jews, Catholics, and Protestants. Although usage was more frequent among lower-classmen, use by juniors and seniors is increasing. Female students reported a lower percentage of drug usage than males. Drug users were more adventuresome than nonusers. (25 ref)—*A. J. Ter Keurst.*

1030. Wolins, Martin (Ed.). (U California, Berkeley) **Successful group care: Explorations in the powerful environment.** Chicago, IL: Aldine, 1974. ix, 463 p. \$14.75.—Presents a collection of relevant research on group child-care in cross-cultural perspective. Successful group-care settings in Austria, Great Britain, Israel, Mexico, Poland, the Soviet Union, and Yugoslavia are detailed, as well as those in the US. (33 p ref)

1031. Zikmund, William G. & Miller, Stephen J. (Oklahoma State U) **Internal/external control of reinforcement and women's participation in direct social action.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1163-1166.—Mailed a questionnaire and Rotter's Internal-External (I-E) Control Scale to a probability sample of women in 1 state to investigate the relationship between internal-external control of reinforcement and women's participation in the 1973 consumers' meat boycott. Analysis of responses on the 166 returned questionnaires did not support the hypothesis that internals, as determiners of their own fate, would be more active in this socioeconomic event. Results suggest

that the power of the I-E Scale to predict boycott behavior is weak.—*Journal abstract.*

## SOCIAL BEHAVIOR AND INTERPERSONAL PROCESSES

1032. Abernethy, Virginia. (Harvard U, Medical School, Boston) **Dominance and sexual behavior: A hypothesis.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 813-817.—Primatological, ethnographic, and psychiatric data suggest the hypothesis that male dominance facilitates male-female copulatory behavior while female dominance inhibits it. A mother-son pair of rhesus macaques is described in which 2 incestuous episodes took place. Several human societies in which the wife is economically independent of her husband and has higher status in the home are discussed, as well as the significance of maternal dominance in the dynamics of male homosexuality. Presentation of these data is followed by suggestions for testing the hypothesis and a discussion of the social and therapeutic implications of the observed relationships. (18 ref)—*Journal abstract.*

1033. Armistead, Nigel (Ed.). **Reconstructing social psychology.** Harmondsworth, England: Penguin, 1974. 330 p. \$3.95.—Presents 20 essays on current developments in humanistic psychology, phenomenology, and Marxism. The value judgments of conventional social psychology are criticized, and suggestions are made for the reconstruction of social psychology for a contemporary society.

1034. Berk, Richard A. (Northwestern U) **Collective behavior.** Dubuque, IA: Wm. C. Brown, 1974. viii, 80 p.—Discusses methodological issues in the study of collective behavior; recent approaches to group processes; and the perspectives of Freud, G. LeBon, H. Blumer, W. Kornhauser, and N. Smelser.

1035. Cahn, Meyer M. (California State U, San Francisco) **Desacralization as a response to group change.** *Interpersonal Development*, 1973-1974, Vol 4(1), 62-64.—Discusses the phenomenon of desacralization. When groups or individuals have not participated in the working through of change experiences, they are often left without sufficient emotional resources for responding in a satisfactory and collaborative way. In such a condition, they often respond by minimizing or negating the story of change which is being reported to them.

1036. Cooper, Cary L. (U Manchester, Inst of Science & Technology, England) **A bibliography of current encounter and T-group research: 1971-1973.** *Interpersonal Development*, 1973-1974, Vol 4(1), 65-68.

1037. Crahay, S. [Close field conflict.] (Fren) *Acta Psychiatrica Belgica*, 1973(Mar), Vol 73(2), 302-310.—Examined therapeutic interviews and analyzed conflict situations which for emotional or social reasons appear to be without solution. These analyses offer a better understanding of the patient's adaptive abilities, or his lack of them, and suggest strategies to help patients in their struggle to adjust to existential conflicts. (Dutch, English, German, Italian & Spanish summaries)—*E. Coché*

1038. Eoyang, Carson K. (Stanford U) **Effects of group size and privacy in residential crowding.** *Journal*

*of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 389-392.—Conducted a field survey of residents of a university trailer park to distinguish between the effects associated with group size and effects associated with social stimulation. The S sample consisted of 58 university students who were asked to rate their living space and their satisfaction with various aspects of trailer living. The results show that with total area fixed, the numbers of occupants per unit accounted for greater variance in living space ratings than did degree of privacy, and time and personal attributes accounted for few differences in satisfaction. Results also support the distinction between the psychological experience of crowding and the conditions that induce it.—*Journal abstract.*

1039. Gerson, Barbara. (New York U) **Consciousness-raising groups with elementary school girls: A case study.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 30-35.—Describes a consciousness-raising (C-R) group for 4th- and 5th-grade girls in a public school. The girls took a questionnaire to determine their degree of sex-role stereotyping; results indicate that members came to the group with "liberated" viewpoints. Differences between girls and women's C-R groups were observed, but also similarities. Topics discussed in group sessions included relationships with parents, sex, dating, attractiveness, marriage, and future careers. The girls seemed to benefit more from talking about present problems than about future goals.—*C. P. McCreary.*

1040. Hinde, R. A. (MRC Unit on the Development & Integration of Behaviour, Cambridge, England) **Biological bases of human social behaviour.** New York, NY: McGraw-Hill, 1974. xv, 462 p.—Reviews studies of nonhuman species and extrapolates from animal to human social behavior. Questions of causation and development in communication, early social experience, mother-infant interaction, aggression and sociosexual behavior, and group structure and spatial relationships are discussed. (35 p ref)

1041. Lankford, Philip M. (U California, Los Angeles) **Comparative analysis of clique identification methods.** *Sociometry*, 1974(Jun), Vol 37(2), 287-305.—Applied 5 methods, each representative of a distinctive mathematical approach to clique identification, to 2 sociomatrices and compared the results. The matrices were selected for their mathematical properties to test certain characteristics of the methods. L. L. McQuitty's linkage analysis provided a cheap, efficient means of producing a few strongly linked cliques. Direct factor analysis and factor analysis of a correlation matrix produced similar results, but direct factor analysis was relatively expensive and provided a less workable solution. C. H. Hubbell's method of raising a matrix to the  $p^{\text{th}}$  power did less well, as the relative number of zero entries may affect the resulting cliques. Multidimensional scaling did very poorly, producing cliques dissimilar to those produced by the other 4 methods. (28 ref)—*Journal abstract.*

1042. Morrison, Richard J. (Carnegie-Mellon U) **Caplow's model: A reformulation.** *Journal of Mathematical Sociology*, 1974, Vol 3(2), 215-230.—Examines T. Caplow's (see PA, Vol 31:6902) model of coalitions in

the triad and identifies several shortcomings. Retaining the basic structure of Caplow's arguments, the problem is recast as one of interdependent rational decision-making. The reformulation allows a more general notion of strength and the adoption of probabilistic choice to allow predictions about the relative frequencies of the various coalitions. (15 ref)

1043. **Murstein, Bernard I. & Spitz, Leah T.** (Connecticut Coll) **Aristotle and friendship: A factor-analytic study.** *Interpersonal Development*, 1973-1974, Vol 4(1), 21-34.—Proposes several hypotheses suggested by Aristotle's concepts of friendship. These hypotheses were tested factor-analytically. 3 dimensions (factors) of friendship were examined: Goodness, Enjoyableness, and Utility. An 80-item bipolar adjective checklist was constructed and administered to 120 female undergraduates. Results of the factor analyses are generally consistent with the formulations of Aristotle as propounded some 2,000 yrs ago.—*Journal abstract.*

1044. **Orlick, T. D.** (U Ottawa, Faculty of Physical Education, Ontario, Canada) **An interview schedule designed to assess family sports environment.** *International Journal of Sport Psychology*, 1974, Vol 5(1), 13-27.—Constructed an interview schedule which proved to be valid and internally consistent, and to have an average inter-rater scoring reliability of .93.

1045. **Schellenberg, James A.** (Western Michigan U) **An introduction to social psychology.** (2nd ed.) New York, NY: Random House, 1974. viii, 360 p.—Presents an introductory review and discussion of 7 areas of social psychology and theory and research—affiliation, aggression, social influence, attitudes, groups, social norms, and personality in society—emphasizing that social psychology is the study of interpersonal processes and behavior. (10 p ref)

1046. **Watts, Thomas D.** (Tulane U) **Ethnomethodology: A consideration of theory and research.** *Cornell Journal of Social Relations*, 1974(Spr), Vol 9(1), 99-115.—Reviews the rationale of ethnomethodology in terms of its linguistic, normative, and reflexive uses. The use of ethnomethodological procedures in assessing the social organization and processing of various institutions (e.g., the judicial system) is also examined. (87 ref)

#### Group Dynamics & Interpersonal Communication

1047. **Behrendt, William; O'Neal, Edgar & Morris, Louis.** (Tulane U, Newcombe Coll) **Beliefs about one's bodily state, emotionality, and aggression.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 411-416.—Gave a placebo to 70 male undergraduates, telling them that it was a stimulant, analgesic, reflex-inhibitor, or vitamin. Ss completed a mood questionnaire, after receiving either 6 shocks (attack) or 2 shocks (no attack), ostensibly an evaluation of their solution to a problem. They then used shock to evaluate a standard solution produced by their former evaluator (a confederate). No significant differences were detected among the placebo conditions in shock number, duration, intensity, or latency. However, among Ss reporting that the "drug" seemed to have some effect, those attacked and taking the reflex-inhibitor had significantly longer shock latencies. Attacked analgesic Ss did not perceive the shocks as less painful but rated themselves highest in insult. (17 ref)—*Journal abstract.*

1048. **Black, Harvey & Angells, Virginia B.** (Boston U) **Interpersonal attraction: An empirical investigation of platonic and romantic love.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1243-1246.—Used a 2 × 4 design to assess effects of sex and college class on judgment of platonic and romantic partners by 198 male and 175 female undergraduates. Females gave higher overall ratings to past or present platonic and romantic partners than males. This result may be attributed to the belief that interpersonal attraction may be related to contemporary sex-role patterns.—*Journal abstract.*

1049. **Brehmer, Berndt.** (U Umea, Psychological Inst, Sweden) **Policy conflict and policy change as a function of task characteristics: III. The effects of the distribution of the validities of the cues in the conflict task.** *Scandinavian Journal of Psychology*, 1974, Vol 15(2), 135-138.—Used K. R. Hammond's (see PA, Vol 40:4126) "lens model" interpersonal conflict paradigm in a 2 × 2 design which varied levels of task predictability and levels of cue validity distribution (only 1 cue valid vs 2 equally valid cues) with 64 paid undergraduates. Results show that the level of agreement was higher when only 1 cue was valid than when both cues were valid, but this effect was obtained only when task predictability was high. In the low-predictability condition there were no differences between the 2 levels of cue validity distribution. Results also show that agreement was a positive function of the predictability of the task. It is concluded that, to understand policy conflict, it is not sufficient to analyze only the characteristics of the parties to the conflict; it is also necessary to analyze the characteristics of the task facing the parties.—*Journal abstract.*

1050. **Brehmer, Berndt.** (U Umea, Sweden) **Policy conflict and policy change as a function of task characteristics: IV. The effect of cue intercorrelations.** *Umea Psychological Reports*, 1974, No 79, 24 p.—Hypothesized that intercorrelations between the cues in the conflict task will inhibit the reduction of the systematic differences in policies in policy conflict as studied in K. R. Hammond's (1965) "lens model" interpersonal conflict paradigm. 2 experiments were conducted with 64 undergraduates in each. Results support the hypothesis and suggest that the effect was due to the fact that the Ss had greater freedom in developing different policies when the cues were intercorrelated. Findings also suggest that the process of policy change, when the conflict task has a lower degree of predictability than the original policy learning task, might differ from that when the conflict task has the same predictability as the original task. (20 ref)—*Journal abstract.*

1051. **Brown, G. A.** (New U Ulster, Coleraine, Northern Ireland) **A reply to Turner and Sevinc.** *British Journal of Social & Clinical Psychology*, 1974(Jun), Vol 13(2), 217.—Responds to C. T. Turner and M. Sevinc's (see PA, Vol 52: 12286) methodological criticisms of the author's study of interaction patterns among British and immigrant children. The criticism that sex bias existed in the data is agreed with, and the reliability of the behavior classification instrument is discussed.

1052. **Carp, Frances M.** (Wright Inst, Berkeley, CA) **Position effects on interview responses.** *Journal of Gerontology*, 1974(Sep), Vol 29(5), 581-587.—Investigat-

ed the effects upon response distributions of 2 types of position effect: the serial order in which response options for an item are presented and the location of an item in an interview. Primacy effect was statistically significant and meaningfully large in regard to evaluative items in an interview with 899 adults aged over 65 yrs; either the positive or negative end of the scale drew more responses when it was presented first. This effect was not observed for factual items. There was no difference in responses to an evaluative item presented early and late in the interview with response options in the same order at both presentations. Results suggest that it may not be necessary to present general questions prior to specific ones in order to avoid response contamination, though further evidence is necessary. It is concluded that (a) to obtain valid group values, counterbalanced presentation of response options is necessary; and (b) standard scores for individuals should be used in making subgroup comparisons and other statistical procedures (e.g., correlational analysis). (16 ref)—*Journal abstract*.

1053. Cicourel, Aaron V. (U California, San Diego) **Cognitive sociology: Language and meaning in social interaction.** New York, NY: Free Press, 1974. 179 p. \$7.95(cloth), \$2.50(paper).—Analyzes the relationship of language and social dynamics and argues for a fuller understanding of the verbal and nonverbal communications which make man a social being. Criticisms of recent linguistic theories are presented to emphasize the idea that cognitive and linguistic structures are basic to social interaction, and empirical data from a 1st-grade classroom and the sign language of the deaf are included to illustrate the principles of ethnomethodology, interpretive procedures and normative roles, and cross-modal communication. (6 p ref)

1054. Codol, Jean P. (National Ctr for Scientific Research, Lab of Social Psychology, Aix-en-Provence, France) **[Social norms and the pattern of equilibrium.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 201-218.—Asserts that the pattern of equilibrium is only a manifestation of social "good form" and is thus highly dependent on the culturally normative character of the social relations to which it is applied. 70 Ss were asked to judge, from their own and others' viewpoints, the more or less normative character of 2 types of social relations; i.e., friendliness-unfriendliness and agreement-disagreement of ideas. Of 16 correlations calculated in the different experimental conditions for the relation between the pattern of equilibrium manifested by each S and the degree of normativeness attributed to each type of relation, 14 were statistically significant. Equilibrium and social norms appeared to be interdependent.—G. Rubin-Rabson.

1055. Efran, Michael G. (Scarborough Coll., U. Toronto, Ontario, Canada) **The effect of physical appearance on the judgment of guilt, interpersonal attraction, and severity of recommended punishment in a simulated jury task.** *Journal of Research in Personality*, 1974(Jun), Vol. 8(1), 45-54.—Conducted an opinion survey with 108 college students and a simulated jury experiment with an additional 66 college students. The survey revealed that most Ss believed that (a) a defendant's character and previous history should influence jurors' decision (79%) and (b) the defendant's

physical appearance should not bias these decisions (93%). The simulated jury experiment tested the hypothesis (derived from a reinforcement model of interpersonal attraction and previous research on physical appearance) that attractive defendants would be more positively evaluated than unattractive ones despite the seeming irrelevance of appearance to judicial decisions. It was found that physically attractive defendants were evaluated with less certainty of guilt ( $p < .05$ ), less severe recommended punishment ( $p < .005$ ), and greater attraction than were unattractive defendants. The importance of independent affective and cognitive components of the attraction process is emphasized. (32 ref)—*Journal abstract*.

1056. Entwisle, Doris R. & Webster, Murray. (Johns Hopkins U) **Expectations in mixed racial groups.** *Sociology of Education*, 1974(Sum), Vol 47(3), 301-318.—Studied how the status characteristics of adults and children affect adults' ability to raise a child's expectations of his own performance on school-like tasks. Black and white 2nd, 3rd, and 4th graders participated in a team story completion task with middle-class black and white young adult women serving as Es. Ss whose rates of volunteering items for the stories were near the median were then assigned to either a 2nd story completion group in which he received strong positive reinforcement from E or a control group in which he listened to a story. All Ss then completed another team story completion task. White adults were effective in raising expectations of white or black children in mixed racial work groups; black adults were effective with black children but not with white children in mixed groups. Results, both consistent and inconsistent with previous findings from homogeneous groups, are interpreted in terms of the children's relative socioeconomic position with respect to members of their own race. (19 ref)—*Journal abstract*.

1057. Fox, Renée C. **Experiment perilous: Physicians and patients facing the unknown.** Philadelphia, PA: University of Pennsylvania Press, 1974. 262 p. \$5.95.—Presents a physician's account of a 2-yr period in the lives of the patients and other doctors on a small metabolic research ward. Problems and stresses of both the physicians and patients are discussed in detail, case examples are presented, and the significance of this "experiment perilous" within the field of the sociology of medicine is examined.

1058. Fromme, Donald K. & Beam, Donna C. (Oklahoma State U.) **Dominance and sex differences in nonverbal responses to differential eye contact.** *Journal of Research in Personality*, 1974(Jun), Vol. 8(1), 76-87.—Divided 16 male and 16 female undergraduates into high- and low-dominant groups based on scores on the Bernreuter Personality Scale. Ss were assigned to 1 of 2 cohorts who either avoided eye contact or maintained a steady gaze. Starting 100 in. apart, Ss were asked to approach the cohort to the point where they felt most comfortable. Dependent measures were personal space, approach rate, reciprocal eye contact, and attitude toward cohort. It was found that high-dominant Ss showed increased proxemic behavior in responding to a direct gaze, while low-dominant Ss showed a decrease. Males tended to use personal space and approach rate to

signal dominance, while females used reciprocal eye contact. An exception was found to previous findings that positive attitudes are associated with high levels of eye contact; low-dominant males, but no other group, responded to direct gaze with a more negative attitude. (24 ref)—*Journal abstract*.

1059. Furukawa, Hisataka. (Kyushu U., Fukuoka, Japan) [The effect of success or failure evaluation upon followers' morale and perception of leadership function.] (Japn) *Japanese Journal of Experimental Social Psychology*, 1972(Mar), Vol. 11(2), 133-147.—Studied the effect of social evaluation (success or failure) upon group members' morale (task satisfaction, group esteem, and group cohesiveness) and their perception of leadership types. 120 junior high school boys were divided into 4- or 5-member groups and asked to make up a story concerning TAT pictures from the Thematic Apperception Test after a 15-min group discussion under a leader whose leadership type was experimentally controlled. The leadership types were performance-oriented (P-type) and maintenance-oriented (M-type). The stories were evaluated by an "authority," who gave success or failure evaluation according to a prearranged scheme. Analysis of variance of Ss' morale scores and evaluation scores of leadership type indicates that (a) the feedback of success evaluation significantly increased Ss' morale and shifted their perception of leadership function toward PM type (strong in both P and M functions), and (b) the feedback of failure evaluation significantly decreased their morale and shifted their perception of leadership toward pm type (weak in both P and M). (23 ref)—*Journal abstract*.

1060. Geen, Russell G. & Stonner, David. (U. Missouri, Columbia) The meaning of observed violence: Effects on arousal and aggressive behavior. *Journal of Research in Personality*, 1974(Jun), Vol. 8(1), 55-63.—80 male college students were either attacked by a confederate or treated neutrally and then watched a violent movie. Groups of Ss were told beforehand that the fighting in the movie was motivated by either desires for revenge, professionalism, or altruism. Other Ss were shown the film without comment. Relative to Ss in all other conditions, Ss who had been attacked and told that the fight was motivated by revenge subsequently (a) gave more intense shocks to the confederate, (b) rated themselves as less restrained in aggressing, and (c) manifested higher levels of blood pressure at the conclusion of the film. Results indicate that the meaning attached to observed violence may affect the aggression elicited by that violence in at least 2 ways: by lowering inhibitions against aggressing and by raising arousal levels. (21 ref)—*Journal abstract*.

1061. Grolman, Bernard. (State U New York, Stony Brook) Helping behavior and group size: Some exploratory stochastic models. *Behavioral Science*, 1974(Jul), Vol. 19(4), 210-224.—Reanalyzes data from previous experiments on helping behavior. An exponential model in which the probability of helping behavior taking place remains constant regardless of number of bystanders appears to fit data from experiments involving noncommunicating strangers. An exponential model in which the probability of helping behavior declines as the square of the number of bystanders appears to fit data from experiments involving strangers in an emergency situa-

tion with communication possibilities. Groups of friends in an emergency situation with communication possibilities appear to coordinate behavior so as to engage in helping behavior with the same probability as single individuals.—*Journal abstract*.

1062. Hogan, James L.; Fisher, Roger H. & Morrison, Bruce J. (Miami U) Social feedback and cooperative game behavior. *Psychological Reports*, 1974(Jun), Vol. 34(3, Pt 2), 1075-1082.—Examined the effects of social feedback (praise and criticism) as well as opponent's strategy on the cooperation of 80 same-sex pairs of undergraduates who played 40 trials of the Prisoner's Dilemma game. Feedback was seen by Ss as administered by a peer or E and was either praise or criticism. There were 5 feedback conditions: peer praise, E praise, peer criticism, E criticism, and a neutral control condition. The opponent's strategy was programmed by E to be either Honest-Cooperative, Honest-Competitive, Dishonest-Cooperative, or Dishonest-Competitive. Analysis indicated that feedback was generally effective in increasing cooperation beyond that in the control group. However, with a competitive opponent, only E praise led to increased cooperation. It is suggested that the clarity of the feedback agent's role is crucial and that ambiguous motives may diminish the effectiveness of his feedback.—*Journal abstract*.

1063. Jacher, Wladyslaw. [Contemporary views upon the social bond.] (Poln) *Roczniki Filozoficzne*, 1973, Vol. 21(2), 61-76.—Considers 2 aspects of the social bond: the process of its spreading in the group, illustrated by empirical social research; and the internal nature of the bond itself, illustrated by studies concerning the elements and processes creating the social bond. A survey of modern thought on the social bond is presented, and 2 specific trends are noted: (a) the attribution of social bonds to an internal consciousness of the psychic states of the community and to a common feeling of unity and identification and (b) the concept that social bonds depend on the relationships of the individual to the group and of the individual group to other existing groups. It is suggested that these trends provide material for wider theoretical and empirical research.—*English summary*.

1064. Kaneko, Satoru. (Kyoto U., Japan) [Bargaining behavior in coalition formation: I.] (Japn) *Japanese Journal of Experimental Social Psychology*, 1972(Mar), Vol. 11(2), 109-126.—Studied coalition formation in a 3-person game when members have different power and are allowed to bargain with any other member to ally or to intervene against alliance of others. Reward division between allied members was also subject to bargaining. Ss were 45 junior high school boys, formed into groups of 3 members according to a near-sociometric test. Types of power triad were 3-2-2, 4-3-2, and 4-2-2. Ss advanced on a game board by throwing a die where the rate of advance was determined by the product of points on the die and the power weight which, if the players were allied, was the sum of weights between the allies. Coalitions were formed between the 2 weaker members, thus confirming T. Caplow's hypothesis for the first 2 types of power triad but rejecting it split the 3rd type. In the 3-2-2 triad, equal split of reward among coalition members was observed more often than parity split in

which the reward received is proportional to the power weight; in triad type 4-2-2, the reverse was true. In 4-3-2 triads, the 2 types of reward splitting occurred equally often. (41 ref)—*Journal abstract*.

1065. Krop, Harry; Messinger, Jacqueline & Reiner, Charles. (VA Hosp, Gainesville, FL) **Increasing eye contact by covert reinforcement.** *Interpersonal Development*, 1973-1974, Vol 4(1), 51-57.—Assessed the effects of contingent covert reinforcement on eye contact in 114 unmarried undergraduates who were given a 52-item self-disclosure questionnaire. Following an initial administration of the questionnaire, Ss were randomly assigned to 1 of 3 groups and were administered the questionnaire for a 2nd time. One group was given covert reinforcement contingent upon 5 consecutive sec of eye contact. The 2nd group was given covert reinforcement noncontingently. A control group received no reinforcement. Following a 3rd administration of the items, results show that eye contact increased significantly only for the contingent covert reinforcement group. Follow-up data show that long-term effects were not manifested.—*Journal abstract*.

1066. Lerner, Richard M. & Moore, Tanes. (Eastern Michigan U) **Sex and status effects on perception of physical attractiveness.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1047-1050.—Studied the effects of ascribed academic status, target-person's sex, and rater's sex on the perception of height, weight, and physical attractiveness. The interrelations among these variables were also studied. 301 college students (61% females) rated a male or a female identified as possessing 1 of 5 levels of academic status. In all status conditions, (a) the male and female target persons were seen as about equal in height; (b) the male was estimated as heavier than the female; and (c) at the lowest and intermediate status levels, female Ss saw the male target person as more attractive than the female, while the reverse tended to be the case for males' ratings of the targets. Height and weight estimates were inversely correlated for the male target and positively related for the female target. Height estimates were positively related to attractiveness ratings for the male target, while neither height nor weight estimates predicted attractiveness ratings for the female target.—*Journal abstract*.

1067. Long, Thomas J. & Bosshart, Donald. (U Illinois) **The Facilitator Behavior Index.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1059-1068.—Attempted to develop an instrument which might identify, in more than a global way, persons having attributes of an encounter group facilitator judged effective by both his peers and superiors. A pilot instrument was developed, administered to 24 group facilitators rating 32 group facilitator trainees, and tested against currently available global rating measures in 2 independent trials. Factor analysis indicated that 3 main attributes make independent contributions to the judged effectiveness of an encounter group facilitator: generalized interpersonal sensitivity, ability to express spontaneously a full range of emotions and feelings, and nondirective leadership style. The scale developed is considered to be a useful feedback tool to aid in group-facilitator training, as well as a promising evaluation technique. A finding of this study leads to questions about the effect of group

consensus as a method of rating the effectiveness of group facilitators.—*Journal abstract*.

1068. Melnick, Merrill J. & Chemers, Martin M. (State University Coll New York, Brockport) **Effects of group social structure on the success of basketball teams.** *Research Quarterly*, 1974(Mar), Vol 45(1), 1-8.—Administered a pretournament questionnaire to measure 2 group structural variables—status consensus and cohesion—to 21 university intramural basketball teams. Won-lost percentages were correlated with multiple measures of each variable. Won-lost percentages of the teams which were ranked highest and lowest on each of the structural variables were also compared. Results show that team performance was not significantly related to either status consensus or cohesion. Several methodological problems in investigating the relationship between group social structure and group success are discussed.—*Journal abstract*.

1069. Moore, Joseph A. (Memorial U Newfoundland, St John's, Canada) **Relationship between loneliness and interpersonal relationships.** *Canadian Counselor*, 1974(Apr), Vol 8(2), 84-89.—Investigated H. S. Sullivan's (1953) view that loneliness is related to the type of childhood friends and activities and G. Zillbörg's (1938) view that lonely adults are more hostile in interpersonal situations. 88 female college students filled in a loneliness questionnaire and Leary's Interpersonal Check List, and answered questions about childhood friends. The hostility hypothesis was confirmed and the friendship hypothesis partially confirmed. The more lonely Ss were significantly more hostile-submissive. Findings suggest that a person's own behavior is an enduring mode of interaction responsible for bringing about, perpetuating, aggravating, and/or solving loneliness feelings. (French summary)—*Journal abstract*.

1070. Parker, Laurence. (Cornell U) **The ridiculous: A critique of "The psychology of interpersonal attraction."** *Cornell Journal of Social Relations*, 1974(Spr), Vol 9(1), 165-178.—Offers a critique of a representative work of the current experimental paradigm presented by S. C. Jones (1974) in "The Psychology of Interpersonal Attraction." It is argued that the results which Jones summarized are either trivial, common knowledge, or based on conceptual confusions and that current methods of research and thinking in social psychology are powerless to shed light on phenomena like love and affection. (22 ref)

1071. Pfeiffer, J. William & Jones, John E. **A handbook of structured experiences for human relations training: Volume IV.** Iowa City, IA: University Associates, 1973. vii, 118 p.—Presents a collection of exercises, techniques, and games (called "structured experiences") designed for experienced-based learning and focusing on individual behavior, constructive feedback, processing, and psychological integration. These human relations training materials were gathered from actual training designs and from facilitators in the field.

1072. Sargent, Harold R. (Pennsylvania State U, Sharon) **A new look at informal organization.** *College Student Journal*, 1974(Apr), Vol 8(2), 63-66.—Discusses the informal organization, which comes into being because of unsatisfactory conditions which need to be remedied, but the solutions offered by the administrative

establishment are unacceptable to the group. The organization crystallizes around a leader who serves as spokesman. The purpose of the group is usually vague and changeable but it must satisfy the need for communication. The reactions and interactions of members of the group influence its initiatives and purposes. Positive personalities in the group achieve cooperation among themselves and other similar groups. The informal organization as a protest group seldom subverts the permanent and general goals of the establishment because it is not usually successful enough to hold its members.—A. J. Ter Keurst.

1073. Scheidt, Fredrick J. & Smith, Mary E. (Vassar Coll) **Same-sex dyads and Toman's theory of birth-order compatibility.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1174.—To examine W. Toman's (1962, 1969) theory of birth-order compatibility and the stability of interpersonal relations, dormitory roommates indicated their birth order and the degree of interpersonal conflict experienced with their roommates. Results show that dyads compatible for birth order exhibited less interpersonal conflict than dyads with incompatible birth order ( $p < .05$ ).

1074. Scherer, Shawn E. (U Toronto, Ontario, Canada) **Influence of proximity and eye contact on impression formation.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 538.—Explored the effect of proximity and eye contact on impressions formed by dyad members under an inflexible seating arrangement. Pairs of Ss ( $N = 40$ ) sat 3.5 ft or 8 ft apart, at 0 or 60° orientations, for 10 min, then rated their impressions of one another. Results support the hypothesis that increased proximity and eye contact elicit greater positive evaluations. Ss rated each other most positively in the 3.5-ft, 60° condition and least favorably in the 8-ft, 0° condition.—Author abstract.

1075. Snyder, E. E. & Spreitzer, E. A. (Bowling Green State U) **Involvement in sports and psychological well-being.** *International Journal of Sport Psychology*, 1974, Vol 5(1), 28-39.—Examined the psychological consequences of sports involvement among adults. The theoretical expectation of a positive relationship between such involvement and psychological well-being was generally supported by the data. The relationship between behavioral involvement and psychological well-being was stronger for females, whereas emotional involvement was a stronger predictor of positive affect among males. The salutary consequences of social interaction with other people may contribute to psychological well-being, and participation in sports is an important means of achieving such interaction. In addition, psychological well-being is likely to result from the intrinsic pleasure and fun that flow from sports. (17 ref)—Journal abstract.

1076. Stamm, Keith R. & Pearce, W. Barnett. (U. Washington) **Message locus and message content: Two studies in communication behavior and coorientational relations.** *Communication Research*, 1974(Apr), Vol. 1(2), 184-203.—Describes a process model of coorientation in which 4 cognitive states are defined in terms of the accuracy with which each person in a dyad perceives the similarity between his own orientation and the orientation of the other. 2 studies are reported which (a) studied

the effects of allowing options in the locus of communication behavior and (b) analyzed the degree of self-disclosure in messages generated with respect to different cognitive states. Ss were 176 undergraduates in Study 1 and 36 high school students in Study 2. Results show that the frequency of messages with a locus external to the dyad was low and did not vary across coorientational states. Variance in self-disclosure was not explained by coorientational states. Findings replicate previously demonstrated regularities in information giving and seeking behaviors.—Journal abstract.

1077. Stamps, Louis W. & Teevan, Richard C. (U Wisconsin, La Crosse) **Fear of failure and conformity in the Asch and Crutchfield situations.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1327-1330.—Investigated the relationship between expectancy of failure and conformity behavior with 63 male college freshmen and sophomores. The Thematic Apperception Test was used to measure fear of failure. Conformity was assessed using both S. F. Asch's 1956 procedure, in which 7 confederates opposed S's judgment, and R. S. Crutchfield's 1955 procedure, in which 4 opposing perceptual judgments were given to isolated Ss. Results support the hypothesis that there would be a positive relationship between conformity and expectancy of failure in the Asch situation and not in the Crutchfield situation. Implications for the modification of fear of failure and related behavior are noted. (17 ref)—Journal abstract.

1078. Stanfield, Gary G. (U Missouri, Columbia) **A critique and integration of the major social psychological approaches to the study of coalition formation.** *Kansas Journal of Sociology*, 1974(Spring), Vol 10(1), 5-17.—Attempts to integrate more closely the personality trait approaches and the structural approach to coalition formation. A historical description of the area is presented, and learning and cumulative score are discussed. A critique of sex and Machiavellianism studies concludes with theoretical speculation merging these 2 approaches. The merits of the competing utilitarian theories are examined, and bases of the superiority of W. A. Gamson's 1961 exchange theory are posited. A brief summary of coalition theory is presented. Previously stated restrictions on the application of coalition theory are criticized, and a broader range of application is set forth. (43 ref)—Journal abstract.

1079. Wolf, Gerrit. (Yale U.) **Some conversational conditions and processes of brief encounters.** *Communication Research*, 1974(Apr), Vol. 1(2), 167-183.—Analyzed conversation—the exchange of opinions between 2 parties—as a function of topical experience, attitude polarization, and 3 behavioral processes (agreement, confrontation, and consideration). 2 experiments were conducted which consisted of 15-min conversations between an undergraduate and a confederate who predominantly expressed agreement or disagreement. Os coded the frequency with which the 3 processes occurred in S's responses. In Exp II, the same Ss from Exp I (30 undergraduates) were used to determine if the experience of Exp I would affect a 2nd conversation. Different effects of experience and behavioral-process factors on the frequency of conversational statements were observed. Behavioral processes did not function by a similarity of attitude mechanism. (18 ref)—L. Gorsey.

1080. Worrall, Norman; Taylor, Vanessa M.; Ricketts, Jennifer P. & Jones, Ann P. (Hatfield Polytechnic, England) **Personal hygiene cues in impression formation. *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1269-1270.**—Studied how the differential weights assigned by 80 undergraduates to negative grooming cues (breath odor, sweat odor, dirty fingernails, and dandruff) are used in impression formation. Both sexes used these cues in a similar way when evaluating the opposite sex, but quite differently when evaluating their own sex.

### Social Perception & Motivation & Attitudes

1081. Austin, William & Susmilch, Charles . (U Virginia) **Comment on Lane and Messé's confusing clarification of equity theory. *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 400-404.**—Critically reviews I. Lane and L. A. Messé's 1972 study, which purports to have clarified key issues in equity theory. The issues surrounding a notion of internal standards, and methodological and procedural flaws in the study under review are discussed.

1082. Baron, Robert A. (Purdue U) **The aggression-inhibiting influence of heightened sexual arousal. *Journal of Personality and Social Psychology*, 1974(Sep), Vol 30(3), 318-322.**—Investigated the hypothesis that heightened sexual arousal tends to facilitate subsequent aggression under conditions where Ss have been exposed to strong provocation from the victim but tends to inhibit such behavior in the absence of prior instigation. 40 undergraduate males were angered or not angered by a confederate of the E, exposed to erotic or neutral stimuli, and provided with an opportunity to aggress against this individual by means of electric shock. Results indicate that heightened sexual arousal was highly effective in inhibiting subsequent aggression by Ss in the angered group but failed to influence significantly the strength of such behavior on the part of Ss in the nonangered condition. (17 ref)—*Journal abstract*.

1083. Brigham, John C.; Bloom, Lawrence M.; Gunn, Steven P. & Torok, Thomas . (Florida State U) **Attitude measurement via the bogus pipeline: A dry well? *Representative Research in Social Psychology*, 1974(Jun), Vol 5(2), 97-114.**—Presented the concepts of response constraint and accuracy constraint as ways of conceptualizing the constraining effects which others may have on a person's expressed attitudinal responses. The bogus pipeline paradigm was used to assess the effects of varying levels of response and accuracy constraints on whites' expressed attitudes. A total of 225 white undergraduates were used as Ss. Attitudes toward blacks were investigated in Studies 1 and 2, and attitudes toward a variety of attitude objects were assessed in Study 3. Few significant differences in responses according to levels of response and accuracy constraint were found. It is suggested that college students' responses in conventional measurement situations, even regarding topics of considerable social sensitivity, may be subject to less intentional bias than is often assumed by researchers. It is further suggested that motivation to avoid being "second-guessed" by a machine may not be as strong as researchers involved with the bogus pipeline paradigm have proposed. (16 ref)—*Journal abstract*.

1084. Calder, Bobby J. (U Illinois) **An analysis of the Jones, Davis, and Gergen attribution paradigm. *Representative Research in Social Psychology*, 1974(Jun), Vol 5(2), 55-59.**—Considers that attribution theories predict that an inference about a behavior is stronger to the extent that the cause of the behavior appears distinctive. The determinants of this idea of distinctiveness are analyzed using the experimental paradigm of E. E. Jones et al (see PA, Vol 37:1306) in which Ss observe a job interview situation. 2 determinants are discussed: (a) typically, the extent to which information about an internal state is assumed on the basis of an individual's belonging to some category of people; and (b) propensity, the extent to which an internal state in general is associated with a behavior. It is concluded that although some previous research has been structured to create distinctiveness through role cues (in-role vs out-of-role), future studies should recognize the possibility of other cues (e.g., occupation) in producing distinctiveness. —*Journal abstract*.

1085. Carlisle, A. L. & Howell, Robert J. (Utah State Prison, Draper) **Comparison of filmed violence and anger as measured by changes in affective states. *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1259-1266.**—Investigated the relationship between anger, filmed violence, and subsequent aggression in 128 male college students. Angered and nonangered Ss (manipulated by the number of shocks received from a confederate) were shown a violent fight scene or a more neutral but exciting auto race scene. Half of the Ss were then allowed to return shock to their aggressor while the other half looked at a magazine. Level of anger was measured at 3 points during the experiment, using a modified version of the Mood Adjective Check List. Results indicate that both the violent film and the neutral film generated anger. Also, hostile aggression occurred regardless of whether Ss had or had not been angered. These results are discussed in terms of catharsis and reinforcement. Problems of interpretation of film results are also discussed. (15 ref)—*Journal abstract*.

1086. Clark, Kenneth B. (City U New York) **Pathos of power. New York, NY: Harper & Row, 1974. xviii, 188 p. \$7.95.**—Traces the origin, the growing implications, and the conclusions to be drawn from the author's theory of power and its abuse. Criticism is made of human intelligence which serves amoral power; the duties of the intellectual toward human survival and the place of the social scientist in the present and future of mankind are discussed.

1087. Crockett, Walter H. & Miesel, Paul . (U Kansas) **Construct connectedness, strength of disconfirmation, and impression change. *Journal of Personality*, 1974(Jun), Vol 42(2), 290-299.**—In a study with 45 male undergraduates, the degree of connectedness of Ss' interpersonal constructs (measured by the Role Construct Repertory Test) was correlated with the change in their impressions of another person on those constructs. It was found that this correlation was significantly positive when Ss' earlier judgments were said to be poor and their inferences to their most central constructs (measured by an implication grid) were directly disconfirmed. The correlation was significantly negative when Ss' earlier judgments were said to be poor but no

inferences were specifically disconfirmed, and was nonsignificantly negative when Ss' earlier judgments were said to be poor and a behavioral prediction keyed to the most central construct was disconfirmed. It is concluded that for Ss whose personal constructs are massively connected, a change of inference on 1 construct dimension demands a change on many others, while changes of Ss whose constructs are sparsely connected are limited to the disconfirmed construct and 2 or 3 other closely related constructs.—*Journal summary.*

1088. Eiser, J. Richard & White, Camilla J. (U Bristol, England) **Evaluative consistency and social judgment.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 349-359.—Examined the assumption that the polarization of a person's judgments of attitude statements is a function both of his own attitude toward the issue and of the verbal labels used to define the endpoints of the rating scale. 75 14-15 yr olds rated 10 statements concerned with the issue of adult authority on 10 bipolar scales that differed with respect to implicit evaluation. Results support the prediction that the more polarization a person shows on a given scale, the more his own evaluations of the items are congruent with the value connotations of the scale labels. (32 ref)—*Journal abstract.*

1089. Ferguson, Leonard W. & Koury, Norman J. (Ohio U) **Peer drug use as estimated by current users, ex-users, and nonusers of marijuana.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1113-1114.—Data from 577 current users of marijuana in grades 7-12, 453 ex-users, and 8,105 nonusers show that current users and ex-users of marijuana overestimated peer drug usage, while nonusers were essentially correct in their estimations.

1090. Griffitt, William; May, James & Veitch, Russell. (Kansas State U) **Sexual stimulation and interpersonal behavior: Heterosexual evaluative responses, visual behavior, and physical proximity.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 367-377.—Examined the effects of erotica-produced sexual stimulation on heterosexual behavior in 2 experiments. Ss were a total of 94 male and 102 female introductory psychology college students. Results of Exp I show that sexually aroused females evaluated the likability of symbolically represented males more positively than that of symbolically represented females. Sexual arousal was found to exert no influence on males' evaluations of symbolically represented females. Exp II showed that (a) sexually aroused Ss of both sexes attended visually more to opposite-sex than to same-sex targets and looked more at heterosexual targets than did nonaroused Ss, (b) sexually aroused Ss who responded negatively to sexual stimulation physically avoided heterosexual persons in terms of seating proximity, and (c) only those who responded positively to sex stimulation evaluated more favorably or looked more at opposite-sex targets than same-sex targets. (23 ref)—*Journal abstract.*

1091. Hodges, Bert H. (Vanderbilt U) **Effect of valence on relative weighting in impression formation.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 378-381.—Assessed relative weighting of traits in 3 types of personality descriptions: those with only

favorable traits (PP), with favorable and unfavorable traits (PN), and with only unfavorable traits (NN). Ss were 48 introductory psychology students. Predictions that traits in PP descriptions would be weighted equally and that the more negative trait in PN and NN descriptions would receive greater weight were supported by the results. The results are generally consistent with the initial impression averaging model, although a possible difficulty with respect to the relative size of set-size effects for PP and NN descriptions was noted.—*Journal abstract.*

1092. Hottel, Joseph H. & Kahn, Arnold. (Iowa State U) **Sex differences in a mixed-motive conflict situation.** *Journal of Personality*, 1974(Jun), Vol 42(2), 260-275.—Hypothesized that (a) males would be more cooperative and more imitative of each other than would females in the Prisoner's Dilemma game; and (b) when given the opportunity to communicate, males would talk about strategy matters and consequently enhance their levels of cooperation and imitation, while females would discuss nonstrategic matters and show less change in their game behavior. These hypotheses were supported with data from 30 male and 30 female undergraduates. Sex composition of the dyad and communication opportunities were varied over 6 blocks and 30 trials each. Results suggest that males are success-oriented and play opportunistically, and cooperative behavior on their part is an attempt to maximize their gains. Females appear more socially-oriented, and their choice of the competitive response may be a defensive measure in a situation where their primary goal of social interaction is restricted. (25 ref)—*Journal summary.*

1093. Knott, Paul D.; Lasater, Lane & Shuman, Rich. (Colorado Youth Services Inst, Denver) **Aggression-guilt and conditionability for aggressiveness.** *Journal of Personality*, 1974(Jun), Vol 42(2), 332-344.—Reports that scores of 22 male undergraduates on the Rokeach Dogmatism Scale, the Coopersmith Self-Esteem Inventory, the Welsh Anxiety and the Psychopathy (Pd) scales of the Minnesota Multiphasic Personality Inventory, and Block et al's Child Rearing Practices Inventory (CRPI) were related to aggression-guilt as defined by the Mosher Incomplete Sentences Test. High- and low-guilt Ss were then exposed to either reinforcement for aggressive responses (shocks to another S) or to nonaggressive responses. Low-guilt Ss emitted more aggressive responses than high-guilt Ss during the baseline period and were more responsive to reinforcement for aggressive responding than nonaggressive responding. There were no differences between high- and low-guilt Ss on the dogmatism and self-esteem measures. Low-guilt Ss were less anxious and had higher Pd scores than high-guilt Ss. Significant differences between the high- and low-guilt groups were also found on the CRPI. (22 ref)—*Journal summary.*

1094. Lamberth, John; Rataj, Gregory W. & Padd, Wayne. (Temple U) **An evaluation of differential topic importance, population homogeneity, and relatedness of attitudinal stimuli in attraction research.** *Representative Research in Social Psychology*, 1974(Jun), Vol 5(2), 89-91.—Conducted a reevaluation of topic importance for D. Byrne and D. Nelson's (see PA, Vol 38:10041) pool of attitudes and obtained differential importance

ratings for 56 completely new items as well as correlations between attitude items and the percentage of people favoring each side of each attitude topic. 197 undergraduates completed a new 56-item attitude survey and Byrne and Nelson's attitude survey in 1 of 2 ways: either by ranking the attitudes from most to least important or by assigning numbers from 1 to 4, 1 being the most important and 4 the least important. Results suggest that importance ratings, population agreement on attitude items, and the degree to which attitude topics are related be more carefully considered in the selection of stimuli used in attraction studies.—*Journal abstract.*

1095. Lester, Andrew M. & Thelen, Mark H. (U Missouri) **Effects of creativity on imitative behavior.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1320. —High- and low-creative undergraduates viewed 2 videotaped clinical interviews with a compulsive hand-washer. The script contained 5 "idiosyncratic" interviewer questions. Ss then played the role of the interviewer with a confederate compulsive handwasher. Creative Ss imitated the idiosyncratic interviewer questions significantly more than noncreative Ss.

1096. Merenda, Peter F.; Shapurian, Reza & Clarke, Walter V. (U Rhode Island) **Pre-election public image of Nixon and McGovern given by English students.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 575-578. —Administered the Activity Vector Analysis to 50 English university students, with instructions to check those words which they truly felt described Nixon and McGovern. These opinions were obtained October 30, 1972, 1 wk before the election. There was much greater consensus regarding the public image of Nixon, who was perceived as a hard-hitting, forceful, self-centered, and dominant personality. McGovern, with much less agreement among the respondents, was described as an optimistic, enthusiastic, self-confident personality who displayed a deep interest in people.—*Journal abstract.*

1097. Messé, Lawrence A. & Lane, Irving M. (Michigan State U) **Rediscovering the need for multiple operations: A reply to Austin and Susmilch.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 405-408.—Replies to W. Austin and C. Susmilch (see PA, Vol 53:Issue 1) who question the validity of the present authors' concept of an internal standard. The truism that only empirical tests can answer empirical questions is reaffirmed.

1098. Miller, Arthur G. (Miami U) **Perceived freedom and the attribution of attitudes.** *Representative Research in Social Psychology*, 1974(Jun), Vol 5(2), 61-79. —192 undergraduates read an essay on amnesty for draft evaders supposedly written by another student. The instructions specified that the position had been assigned or chosen by the writer. The essay's position was either pro or con and was presented in strong or weak terms. Ss were asked a number of questions about the essay and the writer, the primary dependent variable being an estimation of the writer's deepest or truest beliefs on amnesty. The attributional data generally replicated earlier work by E. E. Jones et al (1967, 1971) within correspondent inference theory—specifically that essay content was more determinative of attributed attitudes under choice than no-choice conditions, but still a highly significant factor under no-choice conditions. However,

the finding that a weak essay under no-choice conditions would produce attributions of the opposite attitude was not replicated. The relative weakness of the essays used in Jones et al's and the present study is discussed. Ss were then divided into low and high groups on the basis of the amount of freedom they perceived in both the no-choice and choice conditions. Perceived freedom related in a predictable way to a certain combination of situational variables and meaningfully to a number of judgmental items.—*Journal abstract.*

1099. Naiman, Thomas H. & Breed, George. (U South Dakota) **Gaze duration as a cue for judging conversational tone.** *Representative Research in Social Psychology*, 1974(Jun), Vol 5(2), 115-122.—Showed 9 silent video-recordings of an older male speaking to a younger female to 23 female undergraduates. The 9 recordings differed in the percent of interaction time that each participant looked at the other's eyes (0, 50, or 100%). At the end of each 15-sec recording, Ss rated the listener's attitude toward the speaker and the tone of the conversation. Results indicate that Ss attended to the visual behavior of the participants to decode the nature of each interaction. Conversational tone and listener attitude were rated highest with increased interpersonal gaze.—*Journal abstract.*

1100. Okanes, Marvin M. (Ohio U) **Machiavellian attitudes and choice of values among students in a business college.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1342.—Administered the Rokeach Value Survey and the Mach V Scale to 97 college seniors in a business policy class. The terminal value of equality and 3 instrumental values—forgiving, honest, and imaginative—showed significantly different rankings between high-Mach and low-Mach groups as predicted.

1101. Risky, Dwight R. & Birnbaum, Michael H. (U California, Los Angeles) **Compensatory effects in moral judgment: Two rights don't make up for a wrong.** *Journal of Experimental Psychology*, 1974(Jul), Vol 103(1), 171-173.—Ratings made by undergraduates of the overall level of morality of persons described as having committed both moral and immoral behaviors indicate that the overall goodness of a person was determined mostly by his worst bad deed, with good deeds having lesser influence.

1102. Seligman, Clive; Paschall, Nancy & Takata, Glenn. (Northwestern U) **Effects of physical attractiveness on attribution of responsibility.** *Canadian Journal of Behavioural Science*, 1974(Jul), Vol 6(3), 290-296.—Previous research has shown that a stereotype favorable to physically attractive individuals seems to exist. The present study examined how this "what is beautiful is good" stereotype influences observers' attributions of responsibility to target persons. Ss were 72 male and 72 female high school students. A significant interaction was found between physical attractiveness and the outcome of the event. Physically attractive women were seen as more responsible for a good outcome than unattractive women, while unattractive females were seen as more responsible for a bad outcome than attractive females. Results are interpreted within a framework of balance theory. (French summary)—*Journal abstract.*

1103. Sherman, Richard C. & Dowdle, Michael D. (Miami U) **The perception of crime and punishment: A multidimensional scaling analysis.** *Social Science Research*, 1974(Jun), Vol 3(2), 109-126.—Conducted 2 studies with a total of 412 undergraduates to determine (a) the degree to which seriousness is an underlying dimension in the perception of crimes, (b) the relationship of seriousness and other perceived properties of crimes with punishments prescribed by law and punishments assigned by Ss themselves, and (c) the relationship between personality variables (assessed by the California F Scale and Rotter's Internal-External Control Scale) and both the salience of perceptual dimensions and the severity of punishments assigned. Similarity judgments for 2 sets of crimes were multidimensionally scaled, and in both cases the 4-dimensional solutions were optimal. None of the dimensions was highly associated with judged seriousness. Seriousness was only moderately related to punishments prescribed by law. Authoritarianism and Locus of Control were significantly related to the salience of perceptual dimensions for 1 of the 2 sets of crimes. High authoritarians called for more severe punishments for crimes on 3 of the dimensions in 1 set, but assigned significantly longer sentences than other Ss only for capital offenses. (18 ref)—*Journal abstract.*
1104. Sieber, Sam D. (Columbia U) **Toward a theory of role accumulation.** *American Sociological Review*, 1974(Aug), Vol 39(4), 567-578.—Disputes the assumption that multiplicity of roles produces a strong tendency toward role strain as a consequence of role conflict or role overload. The benefits of role accumulation tend to outweigh any stress to which it might give rise, thereby yielding net gratification. 4 types of rewards derived from role accumulation are discussed: role privileges; overall status security; resources for status enhancement and role performance; and enrichment of the personality and ego gratification. The importance of taking rights more fully into account in research and theory is emphasized. The possibility that barriers to role accumulation are a source of social instability is briefly assessed. (26 ref)—*Journal abstract.*
1105. Sosis, Ruth H. (U Chicago) **Internal-external control and the perception of responsibility of another for an accident.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 393-399.—Investigated the effects of internal-external control (as measured by Rotter's Internal-External Control Scale) upon a perceiver's attribution of responsibility to a defendant in an automobile accident. Ss were 70 high school students who were divided into 3 levels of internal-external control: internal, moderate, and external. Ss were asked to read an account of an automobile accident and a description of the defendant and then to respond to a questionnaire regarding the accident and the defendant. Results indicate that internals assigned the most responsibility to the defendant for the accident, moderates assigned an intermediate amount, and externals assigned the least amount. On items derived from the determinants of the attribution of responsibility as discussed in the literature, internals judged the defendants more harshly than did externals, with moderates falling between the other 2 groups. The data point to the occurrence of projection of the Ss' own respective internality and externality onto the defendant.—*Journal abstract.*
1106. Stevens, Barbara. **The sexually oppressed male.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 16-21.—Presents a theoretical discussion of the meaning of the male sexual stereotype and some of the problems created for men by their sexual roles. In our culture men are denied the opportunity to develop their dependent, emotional selves and are taught a set of rules to "prove" their masculinity. These rules are dehumanizing and prohibit the growth of a truly meaningful relationship with a woman. A case history describes how a man used sexual stereotypes to control or avoid any real relationship with women.—C. P. McCreary.
1107. Stone, Vernon A. & Hoyt, James L. (U Wisconsin, School of Journalism & Mass Communication, Madison) **The emergence of source-message orientation as a communication variable.** *Communication Research*, 1974(Jan), Vol. 1(1), 89-109.—Conducted 2 experiments in which a total of 340 high school seniors were classified as source-oriented, intermediate, or message-oriented by a bipolar test. Results of both experiments support the prediction that source likability would increase attitude change more for source-oriented than for message-oriented persons. In Exp I, the additional prediction that message informativeness would increase attitude change more for message-oriented than for source-oriented persons was supported only when the source was likable; when the source was unlikable, results were reversed. In Exp II, source expertness yielded no differences; however, its manipulation apparently was weak. Intermediate-oriented persons tended to respond in source-oriented ways to source variables and in message-oriented ways to message variables, indicating a need to conceptualize source-message orientation as a 2-dimensional variable. (18 ref)—*Journal abstract.*
1108. Turner, Charles W. & Simons, Lynn S. (U Utah) **Effects of subject sophistication and evaluation apprehension on aggressive responses to weapons.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 341-348.—Investigated the effects of evaluation apprehension and S sophistication on aggressive behavior of 77 male university students. A 3 × 2 design was used consisting of 3 levels of S sophistication and 2 levels of evaluation apprehension in an otherwise close replication of the 7-shock-unassociated-weapons condition from L. Berkowitz and A. LePage (see PA, Vol 41:16673). A 7th condition replicated the procedures of their 7-shock-no-weapons condition. The results indicate that increased levels of both evaluation apprehension and S sophistication led to decreased numbers of shock administered by Ss to their frustrators. The findings suggest that the most naive and unsophisticated Ss should be used in laboratory studies of aggression so that inhibitions do not mask the effects of important independent variables. (16 ref)—*Journal abstract.*
1109. Wittkower, Erik D. & Weldman, Hazel H. (McGill U, Montreal, Quebec, Canada) **[Magical thought and the integration of psychoanalytic and anthropological theory.]** (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(3), 129-137.—Discusses the meaning of

magical thought for psychoanalysts and anthropologists. For psychoanalysts, magical thought is part of the psychopathology of individuals. It is a stage in the child's development, expressing his fantasies of omnipotence under the sway of the pleasure principle as a means of dealing with frustration. The adult regresses to these stages under stress. For anthropologists, magical thought represents magical practices derived from the cognitive structure already existing in adult members of the society. Psychoanalysis links ambiguity in social exchange to psychological ambivalence; anthropology links the feeling of powerlessness against nature to the feeling of impotence. The ecological approach may bridge the gap between these 2 concepts, so that magic may be seen not only as a pathological symptom but also as an adaptive thought process.—*H. Bruml.*

1110. Worchel, Stephen. (U North Carolina, Chapel Hill) **The effect of three types of arbitrary thwarting on the instigation to aggression.** *Journal of Personality*, 1974(Jun), Vol 42(2), 300-318.—Conducted 2 experiments to investigate the aggression-instigating effects of arbitrary thwartings involving either a random frustration, a violation of expectancy, or an elimination of behavioral freedom. Ss were a total of 136 male undergraduates. 3 levels of thwarting were used by assigning Ss the incentive item (credit, cash, or men's cologne) he had rated 1st, 2nd, or least attractive. Results indicate that thwartings involving eliminations of behavioral freedom instigated significantly greater aggression (as measured by evaluations of research assistants) than the other 2 types of thwarting, and that the stronger the frustration involving such an elimination of freedom, the greater the aggression. Frustrations involving a violation of expectancy yielded significantly greater aggression than frustrations not involving such violations only when the thwarting was severe. In the elimination of freedom conditions, the assigned alternative decreased in attractiveness while the denied item increased. The opposite effect was found in the other thwarting conditions. (16 ref)—*Journal summary.*

1111. Wright, Paul H. (U North Dakota) **The delineation and measurement of some key variables in the study of friendship.** *Representative Research in Social Psychology*, 1974(Jun), Vol 5(2), 93-96.—Summarizes a comprehensive report presenting a model and a coordinated assessment technique for studies of friendship formation and change. This summary attempts to highlight expansions of the model since it was originally introduced by the author (see PA, Vol 44:5093) and to outline briefly the major research studies involved in developing and testing the measurement technique. The comprehensive report covers the model as a whole, including background and rationale, and presents the major research on the technique in detail. The friendship questionnaire—the Acquaintance Description Form—is also described.—*Journal abstract.*

1112. Yukl, Gary. (Baruch Coll, City U New York) **Effects of the opponent's initial offer, concession magnitude and concession frequency on bargaining behavior.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 323-335.—2 laboratory experiments examined how a bargainer's aspiration level, offers, and perception of the opponent are affected by a

programed opponent's initial offer, concession magnitude, and concession frequency. Some discrepancies in the research literature on aspiration level hypothesis of bargaining were also investigated. Ss were 60 male undergraduates. Results indicate that Ss had lower aspirations and made a more favorable initial and final offer when the opponent made a hard initial offer than when the opponent made a soft initial offer. Ss made a more favorable final offer, had lower aspirations, and perceived the opponent to be tougher when the opponent made small concessions than when the opponent made large concessions. The superiority of a small-concession strategy occurred only when opponent concessions were frequent and they allowed Ss to obtain positive payoffs from a settlement. (17 ref)—*Journal abstract.*

## COMMUNICATION AND LANGUAGE

1113. Baltzer, Annie. (Hjorring Teachers' Training Coll, Denmark) **[Imitation in the acquisition of the mother tongue and foreign languages.]** (Danish) *Nordisk Psykologi*, 1973, Vol 25(2), 113-121.—Suggests that the term "imitation" fails to take into account essential aspects of acquiring 1st and 2nd languages, i.e., the significance of the situation, the creative or generative aspects, the significance of motivation, or the strategy used by the individual for learning. As an isolated method, imitation will not help the student to progress in a foreign language. (English summary)—*P. Mylov.*

1114. Barry, William J. (U Kiel, Inst of Phonetics, W Germany) **Language background and the perception of foreign accent.** *Journal of Phonetics*, 1974(Jan), Vol 2(1), 65-89.—The interlingual German-English wordpairs *Tip-tip*, *Pass-pus*, and *Busch-bush* (spoken by 4 English and 6 German speakers) were offered to 2 groups of English Os for judgment of their acceptability as English and to 4 groups of German learners of English from 2 regions of Germany for judgment as English or German. Various acoustic properties of the stimuli were measured and the degree of correlation with the group judgments calculated. Results indicate that certain acoustic properties vary systematically according to language and dialect background, and that different properties influence the decisions of the O groups according to their language or dialect background. (39 ref)—*Journal abstract.*

1115. Bentley, C. F. (U Sydney, NSW, Australia) **The monster in the bedroom: Sexual symbolism in Bram Stoker's Dracula.** *Literature & Psychology*, 1972, Vol 22(1), 27-34.—Suggests that the apparatus of vampire superstition in *Dracula* provides a detailed symbolic presentation of human sexual relationships. The sexual symbolism of blood, the vampires' attacks, and the methods used to combat and destroy the vampires (e.g., the wooden stake) are examined.

1116. Black, John W.; Singh, Sadanand & Janocosek, Elizabeth. (Ohio State U, Research Foundation) **Multidimensional analysis of the perceptual uniqueness of 31 English consonantal clusters.** Columbus, OH: Ohio State University Research Foundation, No 16, 1974. 14 p.—12 listeners responded to recordings of 18 nonsibilant and 13 sibilant "doublet" consonant clusters.

Results show that (a) 4-dimensional space provided the most efficient analysis for both sets, (b) clusters were perceived in terms of articulatory features of both members, and (c) frequency of cluster occurrence was a perceptual feature.

1117. Boons, Jean P. (U Paris VII & VIII, France) **Acceptability, interpretation and knowledge of the world: Remarks on the verb PLANTER (to plant).** *Cognition*, 1973, Vol 2(2), 183-211.—Transformational methods have made the acceptability test the instrument of measure and classification par excellence in linguistics. Of the various a priori possible parameters which can influence the result of this test, the factor of semantic interpretation is considered. The necessity is shown of dissociating an extralinguistic part of this interpretation (including the universe of discourse adopted by the informant, the culture to which he belongs, and the importance of certain factors of knowledge—or of ignorance—of the world) from a linguistically pertinent hypothetical interpretation which correlates very closely with questions of syntax or morphology. Extralinguistic semantic concepts are "natural," come immediately to the mind, and screen the research of much more abstract, unfamiliar, and probably unconscious linguistic semantic concepts. This is a boundary which it is necessary to draw in semantics between what is linguistic and what is not (i.e., between what must and what cannot appear in a generative grammar). The linguistic necessity of controlling, and thus of varying, the universes of discourse which can modify the acceptability of a given sentence is stressed. The argument centers around several uses of the French verb *planter* (to plant). (French summary) —*Journal abstract.*

1118. Bowler, James V. **Irma Injection flops.** *Psychiatric Quarterly*, 1973, Vol 47(4), 604-608.—Analyzes Freud's Irma Injection dream in accordance with the rules of dramaturgy, developing the dream as if it were a farce. It is suggested that, if the dream were enacted on a stage, both audience and critic would interpret it as showing Freud's lack of serious consideration for mental illness and as a denunciation of doctors.

1119. Boyanowsky, Ebor O.; Newton, Darren & Walster, Elaine. (Dalhousie U., Halifax, Nova Scotia, Canada) **Film preferences following a murder.** *Communication Research*, 1974(Jan), Vol. 1(1), 32-43.—Tested the suggestion that, under safe conditions of exposure, people may show a preference for potentially fear-inducing events. General attendance by 94 female undergraduates at a film depicting cold-blooded murder and at a control film were compared on the 2 days following the occurrence of a murder on the campus and on the same 2 days 1 wk prior to the murder. Attendance at the murder movie rose (89%) 2 days after the murder when compared with the same day a week before. Also, the 44 students in the victim's dormitory showed a greater preference for the murder movie 1 wk after the crime, whereas the 50 girls in a control dorm showed no preference.—*Journal abstract.*

1120. Chaitin, Gilbert D. (Indiana U) **Religion as defense: The structure of *The Brothers Karamazov*.** *Literature & Psychology*, 1972, Vol 22(2), 69-87.—Suggests that by viewing characters in a literary work as both real persons and as structural components of the

total psychological situation represented in the work, a comprehensive analysis of psychological conflict, theme, and structure can be achieved. This method is applied to Dostoyevsky's novel, *The Brothers Karamazov*, and the themes of parricide, self-sacrifice, and renunciation are detailed as both psychological components and stylistic devices.

1121. Clarke, Peter & Kline, F. Gerald. (U. Michigan) **Media effects reconsidered: Some new strategies for communication research.** *Communication Research*, 1974(Apr), Vol. 1(2), 224-240.—Presents arguments for looking at cognitive outcomes as dependent variables in communication research rather than placing emphasis only on affective realms. This approach also brings attention to the independent-dependent variable emphases found in the communication literature over the last few decades. The social context of media use and the motivations that spring from this contextual embeddedness are also discussed with regard to information use and distribution of information availability. (16 ref) —*Journal abstract.*

1122. Ehrlichman, Howard; Weiner, Susan L. & Baker, A. Harvey. (Educational Testing Service, Princeton, NJ) **Effects of verbal and spatial questions on initial gaze shifts.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 265-277.—Examined the direction of Ss' 1st gaze shift following questions designed to elicit verbal-linguistic or visuospatial processing in 3 experiments under video camera and face-to-face conditions. Ss were a total of 124 right-handed adults. In each experiment, verbal questions elicited significantly more downward gaze shifts than spatial questions. Previous findings that verbal questions elicited more rightward gaze shifts than spatial questions were not replicated. Results appear to be incompatible with theories linking direction of gaze shifts with the functional asymmetry of the cerebral hemispheres. It was also observed that trials on which no gaze shifts were elicited occurred more often for spatial than verbal questions. (French & German summaries) (26 ref)—*Journal abstract.*

1123. Faber, M. D. **Hermia's dream: Royal road to *A Midsummer Night's Dream*.** *Literature & Psychology*, 1972, Vol 22(4), 179-190.—Attempts to explain the total thematic meaning of *A Midsummer Night's Dream* by focusing on the psychological implications of the dream Hermia has while sleeping in the woods near Athens. It is suggested that the dream is primarily erotic and that Hermia's defenses against the dream parallel the play's concern with the problem of mastering and controlling those uncivilized movements which break through the "order" of the human personality. (15 ref)

1124. Falthzik, Alfred M. & Jolson, Marvin A. (U Maryland) **Statement polarity in attitude studies.** *Journal of Marketing Research*, 1974(Feb), Vol 11(1), 102-105.—Studied whether there are differences in response to negatively and positively worded versions of the same attitude-eliciting statements in the context of a survey of 486 shoppers about attitudes toward unit pricing in grocery stores. For 7 out of 12 statements, intensity of agreement with positively posed statement was significantly higher than the intensity of disagreement with the negatively posed version; results indicate that the double agreement phenomenon prevails, but not

sufficiently to reverse the direction of attitudes drawn from any of the statements. A tendency was noted for statement polarity to be more significant when personalized (what a person says about himself) rather than when nonpersonalized (what he says about others) statements are used. It is concluded that a substantial number of the Likert-type or dichotomous statements currently used in marketing research are "loaded," in that they may lead some respondents to give different answers than they would give to another wording of what was intended to be the same issue. (19 ref)—*L. Gorsey.*

1125. Funkhouser, G. Ray & Maccoby, Nathan. (Field Research Corp., San Francisco, Calif.) **An experimental study on communicating specialized science information to a lay audience.** *Communication Research*, 1974(Jan), Vol. 1(1), 110-128.—Tested the effects of stylistic and rhetorical manipulations in specialized scientific writing on enjoyment, information gain, and attitudes of 3 different audiences (junior college students, university students, and professional scientists). Stylistic and rhetorical variables had some effects, but more with less-qualified audiences. Students and scientists held similarly favorable attitudes toward science and equally appreciated a simple writing style.

1126. Ginter, James L. (Ohio State U) **An experimental investigation of attitude change and choice of a new brand.** *Journal of Marketing Research*, 1974(Feb), Vol. 11(1), 30-40.—Investigated the relationships between changes in attitude toward a new brand and exposure to advertising for that brand, and the relationship between attitude, choice, and the use of the brand, stressing that the study combined attitude dynamics with choice behavior and advertising exposure at the individual level rather than with aggregate data. 453 housewives participated in a 4-wk study in which each week they viewed a different taped ¼-hr TV program with commercials for new brands of spray disinfectant and a common household cleaning product (HCP). The same commercials were used for each of the new brands. Ss also participated in simulated shopping trips each week, and completed pre- and postexposure attitude and preference questionnaires. Results show that attitudes change both before and after choice of the new brand; the postchoice attitude is greater in magnitude and correlated more highly with choice. Preference was a better predictor of choice than multi-attribute measures of affect. Attitude changes were not related to demographic variables, general product use characteristics, or the number of times the commercial was seen. (20 ref)—*L. Gorsey.*

1127. Groen, Guy J. (National Inst of Education, Washington, DC) **The representation of sequential concepts as locally testable events.** *Behavioral Science*, 1974(Jul), Vol. 19(4), 238-253.—Notes that theoretical accounts of the complexity of patterned sequences usually incorporate a notational scheme for representing the sequence and a classification of complexity derived from the representation. This paper examines (a) whether some modification of this notation can be applied to finite state languages and (b) the extent to which finite state languages and patterned sequences vary in complexity for common reasons. A notational system is developed on the basis of automata theory which allows

a classification of complexity based on properties of hypothetical pattern matching devices, and which can also represent aspects of the induction process. (19 ref)—*Journal abstract.*

1128. Grundy, Dominick E. (Rutgers State U) **Growing up Dickensian.** *Literature & Psychology*, 1972, Vol. 22(2), 99-106.—Discusses the thematic components of Dickens's use of childhood experiences in his novels, including the abandonment of the child and the question of development and identity. The themes of the search for maturity, the need to fulfill the expectations of others, and the child's struggle to fit into the adult world are detailed in 3 novels.

1129. Hadding, Kerstin & Studdert-Kennedy, Michael. (Lund U, Sweden) **Are you asking me, telling me, or talking to yourself?** *Journal of Phonetics*, 1974(Jan), Vol. 2(1), 7-14.—Required 22 graduate and undergraduate students to separate various fundamental frequency ( $f_0$ ) contours into 3 categories rather than 2 in order to establish the perceptual validity and linguistic function of the 3rd category. The fundamental frequency of a 700-msec vocoded utterance was systematically varied to produce 72 contours differing in  $f_0$  at the stress and over the terminal glide. The contours were recorded (a) carried on the speech wave and (b) as frequency modulated sine waves. Ss classified both speech and sine wave contours as terminally rising, falling, or level and classified speech contours as those of a speaker addressing a question to a listener, making a statement to a listener, or talking to himself. Results show that listeners can, with some reliability, separate terminally level from terminally rising or falling contours. If the level terminal glide is combined with an even, low-to-moderate pitch over earlier sections of the contour, listeners tend to judge the utterance as that of a speaker talking to himself. A new prosodic feature [+/-Listener] implemented by variations in fundamental frequency is proposed.—*Journal abstract.*

1130. Haggard, Mark. (Queen's U, Belfast, Northern Ireland) **Perceptual processing of coarticulation: A case study of /I/. *Journal of Phonetics*, 1974(Mar), Vol. 2(2), 117-123.**—Notes that spectrographic data show effects of both initial and postvocalic /I/ upon average vowel formant frequencies. The present 2 experiments (with 10 undergraduate Ss in each) investigated preference judgments for  $F_1$  and  $F_2$  in 3 vowels in /I/ context. In Exp I Ss were asked to choose the vowel of a pair that was more similar in quality to a preceding isolated vowel. Significant preferences were obtained chiefly on vowels preceding /I/ and only for  $F_2$  variations. Exp II showed poor discriminability of contextual differences in both  $F_1$  and  $F_2$  values during /I/ steady states. Data are interpreted as favorable to the proposition that perception can solve the problem of coarticulation in at least 2 different ways—by modeling it in detail (weak form of motor theory) or by applying an information-losing categorical strategy.—*Journal abstract.*

1131. Haltresht, Michael. (Indiana U) **The dread of space in Conrad's *The Secret Agent*.** *Literature & Psychology*, 1972, Vol. 22(2), 89-97.—Suggests that Joseph Conrad's documented feelings of restlessness assumed the form of a fear of open spaces which is thematically developed in his novel *The Secret Agent*.

The view that open spaces suggested emptiness or boundlessness to Conrad is detailed in terms of the circles which play an important symbolic role in the life of the main character, the death complex exhibited by other characters, and the novel's use of multiple characters and confusing leaps in time and action.

1132. Helms, Randel. (U California, Los Angeles) **Blake at Felpham: A study in the psychology of vision.** *Literature & Psychology*, 1972, Vol 22(2), 57-66.—Discusses autobiographical elements in William Blake's poem *Milton*, the nature of the poem's almost prophetic visions, and possible psychoanalytic interpretations of the imagery and content of the poem. The nature of Blake's "divine plan" is explicated and characteristics of the visionary experience are examined.

1133. Hess, Allen K. & Gossett, Dan. (Oakland U) **Nixon and the media: A study of non-immediacy in newspaper editorials as reflective of geographical attitude differences.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1055-1058.—Analyzed 7 Northern and 7 Southern newspaper editorials discussing President Nixon's 1969 speech on the "Vietnamization" of the Vietnam War for their attitude toward President Nixon and his proposals. Although manifest ratings indicated no difference between North and South editorials, nonimmediacy scores showed that Northern editorials were less favorable toward President Nixon.

1134. Hirata, Kenichi. (Aichi U of Education, Japan) **[Letter sequences varying in order of approximation to Japanese.]** (Japn) *Japanese Journal of Psychology*, 1974(Apr), Vol 45(1), 33-37.—Letter sequences of zero-through 2nd-order approximation to Japanese were computer-generated using tables of single-letter and digram frequencies. The single-letter and digram structures of the sequences were tested by calculating correlation coefficients between observed frequencies in each sequence of 10,000 letters and those of the original tables of the zero-order material, using the goodness-of-fit test with the uniformity hypothesis. Results confirm that the sequences were properly generated. 8 examples of 25-letter sequences of zero to 2nd-order material and 30 10-letter sequences of each type, selected with the restriction that no letter should appear more than once in the sequence are presented.—*English abstract*.

1135. Howitt, Dennis & Cumberbatch, Guy. (U. Leicester, Centre for Mass Communication Research, England) **Audience perceptions of violent television content.** *Communication Research*, 1974(Apr), Vol. 1(2), 204-223.—Investigated judgmental aspects of TV program content (e.g., the legitimacy of the violence depicted) and the relationships between different aspects of program content. British TV viewers were administered a 7-point bipolar rating scale on which they evaluated 37 TV programs across 50 potential attributes. 6-17 viewers rated each program. Attributes were determined from previous research and from open-ended interviews with a different sample of respondents. A factor analysis of rating scales for each program revealed 10 program content attributes—Realism, Violence, Social Status, Establishment (e.g., characters on the side of law and order), Conventionality, Women's Involvement, Identification (e.g., British vs American characters

and personal relevance), Emotional Interaction, Humor and Activity, and Justified Violence.—*L. Gorsey*.

1136. Hustad, Thomas P. & Pessemier, Edgar A. (York U., Toronto, Ontario, Canada) **Will the real consumer activist please stand up: An examination of consumers' opinions about marketing practices.** *Journal of Marketing Research*, 1973(Aug), Vol. 10(3), 319-324.—Data from a survey of 912 women in a midwestern industrial community, who had been divided according to attitudes about business and marketing practices, show that it is possible to describe differences between pro- and antibusiness groups in terms of a variety of personal and life-style characteristics. Antibusiness consumers cannot be dismissed as an insignificant dissident group, but rather are more accurately described as an activist, avant-garde segment of society with both the motivation and the ability to effect change.

1137. Jaarsma, Richard J. (Paterson State Coll) **The "Lear complex" in *The Two Gentlemen of Verona*.** *Literature & Psychology*, 1972, Vol 22(4), 199-202.—Suggests parallels between the father-daughter confrontation in *The Two Gentlemen of Verona* and the conflict between Lear and Cordelia in *King Lear*. The role of unconscious sexual motives as expressed in both the language and theme of the 2 plays is examined.

1138. Jacoby, Jacob; Speller, Donald E. & Kohn, Carol A. (Purdue U) **Brand choice behavior as a function of information load.** *Journal of Marketing Research*, 1974(Feb), Vol 11(1), 63-69.—Used 153 undergraduates in a 3 (number of brands)  $\times$  3 (items of information for each brand) design in which Ss received either 2, 4, or 6 items of information for either 4, 8, or 12 fictitious brands of laundry detergent. 6 information dimensions each having any 1 of 7 values (very low-very high) were used. Ss were asked to indicate their laundry habits and how important each of the 6 dimensions were to them on a 5-point scale, and to describe their "ideal" brand of detergent using the 7-point scales. They were then given a list of different brands of detergent with varying items of information and asked to choose the one they liked best. Finally, satisfaction with the decision, the extent of confusion felt, and the extent of need for more information were assessed. Data indicate that increasing package information load tends to produce (a) dysfunctional consequences in terms of the consumer's ability to select the brand that is best for him, and (b) beneficial effects on the consumer's degree of satisfaction, certainty, and confusion regarding his selection (i.e., Ss felt better with more information but actually made poorer purchase decisions). (19 ref)—*L. Gorsey*.

1139. Johnson, William R. & Smith, Edward W. (Georgia State U) **Responsivity to incongruent verbal and non-verbal communications and A-B therapist type.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1066.—58 male undergraduates classified as either A or B therapist types rated videotaped scenes conveying incongruent verbal and nonverbal messages along the dimensions of happy-sad and superior-inferior, and completed a standardized paper and pencil test involving incongruent verbal and nonverbal messages. The hypothesis that As would be more responsive than Bs to the nonverbal channel in the incongruent messages was not supported.

1140. Klein, Helen A.; Klein, Gary A. & Hildum, Donald C. (Wright State U.) **Articulatory and constituent phrases as facilitators of word identification decisions.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 337-342.—Used a word-boundary task in 3 experiments to explore the role of phrase and sentence information in the processing of written language. Ss were a total of 304 undergraduates. Articulatory phrases (rhythmical patterns of spoken language) and constituent phrases (underlying syntactic analysis of the sentence) both provided strong and about equal facilitating effects on processing performance. Sentence cues as a function of sentence length were also evaluated. Results are discussed in terms of flexible strategies for imposing structure on linguistic sequences. (20 ref)—*Journal abstract*.
1141. Krulee, Gilbert K. & Ramsburg, Robert E. (Northwestern U) **Semantic anomalies and sentence recognition.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1275-1286.—34 college students and staff members read for immediate recall sentences which either were meaningful or were constructed to be anomalous in particular ways. 3 types of sentences were used: equational, transitive, and intransitive. There were also 3 types of anomalies which were either in the subject phrase of the sentence, in the predicate phrase, or in the relationship between the subject and predicate phrase. Results show that equational sentences can be processed most easily. For all types of sentences, the presence of an anomaly had a disruptive effect in that time to process a sentence was increased. However, the effect of a particular type of anomaly was a function of the type of sentence in which it occurred. A possible explanation for these findings, emphasizing the use and verification of the selectional restrictions associated with each sentence, is suggested. (29 ref)—*Journal abstract*.
1142. Ley, Ronald & Karker, Jürgen. (State U New York, Albany) **Pronunciability ratings of 319 CVCVC words and paralogues previously assessed for meaningfulness and associative reaction time.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 421-424.—Undergraduates rated the ease of pronunciability of each of 139 consonant-vowel-consonant-vowel-consonant (CVCVC) units in relation to the other units along a continuum. Results indicate that the pronunciability ratings of the CVCVCs assessed are reliable and valid measures.
1143. Locatelli, Françoise. (U Paris V—René Descartes, Lab of Experimental & Comparative Psychology, France) **[Use of verb tenses by adults.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 179-190.—Constructed sentences containing 2 blanks instead of verbs, with the infinitive form of each verb shown under the blank. The syntactic form of the sentence and the order in which the 2 events were mentioned varied. Ss were asked to fill in blanks so as to construct sentences which would express the sequence of the 2 actions. Use of coordinate clauses joined by "and" created fewer disagreements between verb tenses than the use of subordinate clauses. Past, present, and future were the tenses most frequently used, but a preference for beginning a sentence with the present tense was noted. When events were not mentioned in the order of their occurrence, the present tense was used for the 1st verb, and the past tense for the 2nd one.—*G. Rubin-Rabson*.
1144. McClure, Robert D. & Patterson, Thomas E. (Syracuse U.) **Television news and political advertising: The impact of exposure on voter beliefs.** *Communication Research*, 1974(Jan), Vol. 1(1), 3-31.—Studied the relationship between voter belief change and exposure to both political commercials and weeknight network news during the 1972 presidential campaign. While traditional media effected arguments adequately account for the minimal belief change, the direct and dramatic belief change consistently and systematically associated with voter exposure to political advertising cannot be accounted for.
1145. Olsen, Svend E. (Copenhagen U, Denmark) **[Linguistic psychology and psychopathology.]** (Danish) *Nordisk Psykologi*, 1973, Vol 25(2), 84-92.—Presents and defends a theory on the use of language and communication. Meaning is not acquired, as generally believed by psychologists, by a reproduction of reality. Linguistic competence cannot be discriminated from other cognitive processes. (English summary) (18 ref)
1146. Panagos, John M. (Kent State U) **String complexity increases phonemic interference.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1219-1222.—3 groups of 30 monolingual undergraduates who were native speakers of English attempted to pronounce a non-English phone embedded in 1-, 4-, and 7-syllable phonological strings. The number of phonemic errors made increased with syllable complexity, with 1-syllable Ss showing quick sound recognition, native phoneme inhibition, and phonetic approximations of the target sound. It is suggested that string complexity causes selective attention to shift away from the phonetic detail of the stimulus to a phrasal level of analysis.
1147. Pepper, Susan & Prytulak, Lubomir S. (U. Western Ontario, London, Canada) **Sometimes frequently means seldom: Context effects in the interpretation of quantitative expressions.** *Journal of Research in Personality*, 1974(Jun), Vol. 8(1), 95-101.—33 college students supplied numerical definitions for 5 quantitative expressions either embedded in 2 high-frequency contexts, 1 moderate-frequency context, or 2 low-frequency contexts, or with no context specified. Mean definitions differed significantly across contexts and expressions, and a Context  $\times$  Expression interaction effect was obtained ( $p < .01$ ). The variance in definition of an expression embedded in a context generally increased with the discrepancy between its no-context definition and the estimated frequency of the context event ( $p < .05$ ). Variance in the definitions of the sampled expressions gathered over diverse contexts increased with the expression's no-context definition. Thus, the mean and variance of an expression's numerical definitions depended upon both the expression and its context.—*Journal abstract*.
1148. Piotrowski, Zygmunt A. (Thomas Jefferson U) **The Piotrowski dream interpretation system.** *Psychiatric Quarterly*, 1973, Vol 47(4), 609-622.—Comments on J. V. Bowler's (see PA, Vol 53:Issue 1) analysis of Freud's Irma Injection dream and answers Bowler's inference that Freud showed little compassion for Irma's suffering, being motivated only by the desire to prove his theories

right. The author stresses the importance of dreams and discusses his system of 8 rules and 2 axioms for dream interpretation. This system is applied to Freud's dream and to an analysis of his inner conflicts, self-criticism, and self-education. It is noted that the dream preceded the most creative period in Freud's life. (18 ref)—*B. McLean*.

1149. Pratt, Branwen E. **The role of the unconscious in *The Eternal Husband*.** *Literature & Psychology*, 1972, Vol 22(1), 13-25.—Discusses the themes of dualism of human personality, the return of repressed conflicts, self-punishment, and the fascination with degradation in Fyodor Dostoevsky's novel, *The Eternal Husband*. The function of the unconscious in helping man cope with the pressures of reality is examined in terms of the escape from self-knowledge.

1150. Rintelmann, W. F. (Michigan State U) **Effects of amplitude compression upon speech perception: A review of research.** *Scandinavian Audiology*, 1972(Sep), Vol 1(3), 127-134.—Discusses the basic types of compression amplifiers, with emphasis on the primary features affecting the performance characteristics of compression amplitude controlling devices. A historical review of the application of amplitude compression for the hearing impaired is presented, with emphasis on studies concerning the effects of compression amplifiers upon speech perception. (Danish summary) (22 ref)

1151. Roland, Alan. **Imagery and symbolic expression in dreams and art.** *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 531-539.—Questions the basic assumption of psychoanalytic theory that the development of language historically and individually is from the metaphorical to the conceptual. The literature concerning language in psychoanalysis is reviewed. The symbolic expression of various internalized images in art has been insufficiently appreciated. The primary process mechanisms of displacement, condensation, and symbolization serve a dual function—childhood memories and defensive mechanisms. (38 ref)—*R. S. Albin*.

1152. Rose, Gilbert J. (Yale U, Medical School) **On the shores of self: Samuel Beckett's "Molly": Irredentism and the creative impulse.** *Dynamische Psychiatrie*, 1974, Vol 7(2), 73-90.—Offers an interpretation of Beckett's story as an immediate and symbolic presentation of the creative process. In the light of current research on primary narcissism and the early ego-state a close relationship is seen between creativity and the development of identity. (German summary)—*H. Brum*.

1153. Sandström, C. I. (School of Education, Stockholm, Sweden) **Proposals to phenomenological approaches in determining architectural spaces.** *Scandinavian Journal of Psychology*, 1974, Vol 15(2), 81-88.—Presents arguments in support of phenomenological approaches to the analysis of space and time as central concepts in architecture. With the departure from an illustrative experiment on judgment, conducted with 152 university students, some basic shortcomings of a psychophysical scaling approach are discussed. The psychological meaning of the concepts "here" and "now" is clarified with several illustrations (e.g., the spatial character of a person's 1st recollections, and examples from everyday life and history). The optimal

psychological present space ("here") was revealed with special clarity in the field of sports.—*Journal abstract*.

1154. Schiavetti, Nicholas & Burke, John P. (Newark State Coll) **Comparison of males' and females' estimates of transition probability in speech.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1121-1122.—Data from male and female undergraduates who participated in transition probability estimation tasks under diverse and restricted conditions using either single-guess, continuous-guess, or cloze methods show that there were no sex differences in the estimates and that the single-guess method is easier and less time-consuming to administer.

1155. Sharon, Amiel T. (Educational Testing Service, Princeton, NJ) **What do adults read? Reading Research Quarterly**, 1973-1974, Vol 9(2), 148-169.—Surveyed a national sample of 5,067 adults to determine characteristics of their reading activities. It is concluded that American adults spend a considerable amount of time in reading—nearly 2 hrs/day for the average person—and that a wide variety of materials are read: (e.g., street signs, books and newspapers). The 5% of adults who do not read tend to be of low socioeconomic status, and depend upon others to read for them. (French & Spanish abstracts)—*E. J. Mason*.

1156. Smith, LeRoy W. **Daniel Defoe: Incipient pornographer.** *Literature & Psychology*, 1972, Vol 22(4), 165-178.—Discusses the development of pornographic literature in England and describes pornographic elements in the works of Daniel Defoe. The inclusion of super-permissive parent figures, incestuous relationships, lower-class characters who are sexually uninhibited, passionate and responsive female characters, and the easy accomplishment of seduction are themes which appear in most of Defoe's novels. The relation of pornographic literature to the social behavior of the 18th and 19th centuries is also discussed.

1157. St. Clair, Robert N. & Mural, Harold M. (U Louisville) **Code switching in Hawaiian Creole.** *Kansas Journal of Sociology*, 1974(Spr), Vol 10(1), 75-82.—Describes the phenomenon of code switching among Hawaiian Creole speakers, in which speech intonation, lexicon, and grammar rules are varied according to the social context of situations. Advantages for the sociolinguist of studying speech on the multilingual Hawaiian Islands are discussed.

1158. Stromnes, Frode J. (U Turku, Finland) **To be is not always to be: The hypothesis of cognitive universality in the light of studies on elliptic language behaviour.** *Scandinavian Journal of Psychology*, 1974, Vol 15(2), 89-98.—To examine whether the cognitive base of natural language is universal, 2 preliminary studies of reportorial writing and speech were made, and an experiment was conducted with 73 native Finnish-speaking and 82 native Swedish-speaking high school students. It was theorized that, when a speaker or writer has too little time or space to use complete, grammatically well-formed sentences, he will first leave out the parts of speech which are least essential for the decoding process of the receiver. If, in 2 different languages, different parts are left out, the cognitive base of the languages cannot be the same. It was predicted that native Finnish-speaking Ss would be more prone to leave

out the verb from newspaper headings and from reports of sporting events than would native Swedish-speaking Ss. In addition, it was expected that Finnish Ss would rate sentences lacking verbs as more, and sentences lacking nouns as less, "language correct" than would Swedish Ss. The predictions were borne out exactly by the findings, which are strongly negative to the universality hypothesis.—*Journal abstract.*

1159. Svebak, Sven. (U Bergen, Psychological Inst, Norway) **A theory of sense of humor.** *Scandinavian Journal of Psychology*, 1974, Vol 15(2), 99-107.—Considers that humor is a strategem for relating the collective social reality of a group of persons (the rational world) to their personal imaginations of alternative social worlds, meanings, or identities (the irrational world). The humorist is committed to the rational world. At the same time he permits idiosyncratic fantasies to occur within the social context if they are accompanied by an explicit message saying that the performance is made for fun. The comical situation is composed of 3 essential elements: the message, the audience, and the target or content treated by the message. The message brings the target to the irrational level, where it is brought into disrespect in favor of the alliance between the humorist and his audience. A conceptual scheme is proposed for prediction of laughter, based on 3 dimensions of the comic situation: the humorous message, interpersonal likings, and permissiveness towards actual laughter. The corresponding personal dispositions are the habitual sensitivity to such messages, the habitual tendency to favor comical situations and persons, and the habitual need for emotional-impulse control. Suggestions are made for the modification of laughter by constellations of high and low values on these variables. (38 ref) —*Journal abstract.*

1160. Szybillo, George J. & Heslin, Richard. (Purdue U) **Resistance to persuasion: inoculation theory in a marketing context.** *Journal of Marketing Research*, 1973(Nov), Vol 10(4), 396-403.—Applied inoculation techniques from social psychology to a controversial issue (i.e., whether air bags should be installed as passive safety devices in all new cars) in a marketing context using 240 undergraduates. A  $4 \times 2 \times 2 \times 2$  factorial design was used, consisting of 4 levels of defense (supportive, refutational-same, refutational-different, and no defense), 2 levels of time to attack (immediate and 3 days), 2 levels of source attack (high and low credibility), and 2 levels of trials (pre- and postbelief measurement). 2 control groups—an external-events control and a no-pretest control—were also used; the external-events group was used to determine whether events which occurred during the experimental time period would influence results. Predictions from inoculation theory were confirmed—all defenses produced greater resistance to attack and the refutational defenses produced greater resistance than supportive defenses. Time to attack had no effect on resistance.—*L. Gorsev.*

1161. Taylor, Donald S. (U Oregon) **Chatterton: Insults and gifts to the Rev. Mr. Catcott.** *Literature & Psychology*, 1972, Vol 22(1), 35-43.—Discusses the ambivalent relationship between the writers Thomas Chatterton and Alexander Catcott in terms of father-son and oedipal conflicts. The role of religion and mythology

in Chatterton's work is explicated, and the final reconciliation which is suggested in the poem "The Death of Nicou" is considered.

1162. Terry, Roger L. & Ertel, Sarah L. (Hanover Coll) **Exploration of individual differences in preferences for humor.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1031-1037.—Correlated liking scores for hostile, sexual, and nontendentious cartoons with scores on the Sixteen Personality Factor Questionnaire of 20 female and 19 male undergraduates. Sexual cartoons were liked more by males, especially by those tending to be tough or group-dependent, than by females, especially by those with higher general intelligence. Nonsense cartoons were liked more by females, especially by those with lower general intelligence. (21 ref)—*Journal abstract.*

1163. Verstiguel, Jean C. (National Ctr for Scientific Research, U Paris VIII, Lab of Psychology, France) **[Acceptance and rejection of semantic properties: Influence of the degree of specificity.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 191-200.—In a true-false reaction-time (RT) task, Ss were presented with words and properties, and identified these properties as belonging or not belonging to the concepts underlying the words. Analysis showed that for true responses, RT was influenced by the degree of generality of the properties. However, RT for false responses was not influenced by the degree of generality of the properties. Results are discussed in terms of memory search mechanisms, with reference to Sternberg's self-terminating and exhaustive search hypothesis.—*G. Rubin-Rabson.*

1164. Vincenzo, Joe & Hendrick, Clyde. (Kent State U) **Impact of sound effects and dramatic speech style on speaker perception, attitudes, and speech recall.** *Bulletin of the Psychonomic Society*, 1974(Jun), Vol 3(6), 434-436.—Measures of undergraduates' moods, attitude, and recall of a tape-recorded speech reveal more persuasion for a serious than for a dramatic version of the speech. Serious-dramatic and sound-no-sound manipulations interacted in determining mood ratings, whereas overall attitudinal acceptance was independent of the affect expressed by Ss.

1165. Wartella, Ellen & Ettema, James S. (U Minnesota, School of Journalism & Mass Communication) **A cognitive developmental study of children's attention to television commercials.** *Communication Research*, 1974(Jan), Vol. 1(1), 69-88.—Studied the role of stimulus complexity in children's attention to TV commercials by observing 120 nursery, kindergarten, and 2nd-grade children's attention to 12 commercials varying in visual and auditory complexity. The largest difference in attention to high- vs low-complexity commercials occurred in nursery school Ss, although in 1 block of commercials the difference was not significant. (17 ref)

1166. Wilson, F. A. (Simon Fraser U, Burnaby, British Columbia, Canada) **Yeats's "a bronze head": A Freudian investigation.** *Literature & Psychology*, 1972, Vol 22(1), 5-12.—Suggests that W. B. Yeats's poem, "The Bronze Head," embodies his fullest expression of latent bisexuality and that his imagery amounts to a substitute language used to express deep psychological truths. Yeats's ambivalence to his feminine character is

detailed in the rhythm, dramatic transitions, and inverted images of the poem.

1167. **Wiseman, Frederick.** (Northeastern U.) **Factor interaction effects in mail survey response rates.** *Journal of Marketing Research*, 1973(Aug), Vol. 10(3), 330-333.—Investigated the relationships between 4 variables previously used to increase response rates in mail questionnaire surveys: small monetary incentives, nature of the return envelope, follow-up reminder, and offer of survey results. Data suggest that these variables operate independently and that there are few interaction effects.

## PERSONALITY

1168. **Attkinson, C. Clifford; Waidler, Valerie J.; Jeffrey, Paula M. & Lambert, E. Warren.** (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Interrater reliability of the Handler Draw-a-Person scoring.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 567-573.—Tested the method developed by L. Handler in 1967 for scoring the Draw-A-Person test (DAP); previous scoring systems had low levels of predictive validity. Drawings of human figures by 54 female undergraduates were scored on 21 variables. Reliability estimates indicated that Handler's procedures have high interrater reliabilities. The DAP indices had a median interrater reliability of .90, this being congruent with the median coefficient of .87 reported by Handler. (19 ref)—*Journal abstract.*

1169. **Barna, James D.** (U Dayton) **Invasion of privacy as a function of test set and anonymity.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1028-1030.—Administered the MMPI and the Barna-Rychlak Causal Construct Scale to 55 undergraduates under conditions of either anonymity or invasion of privacy. After 2 Ss refused to participate, only 3 Ss perceived 2, 3, and 5 MMPI items offensive, respectively; removal of these items only changed raw scores 1 point for 2 Ss on 1 and 2 scales. Results indicate that it is possible to follow American Psychological Association policy on the ethics of personality assessment in a standardized testing situation.

1170. **Becker, Reinhold.** (U Heidelberg, Psychiatric Clinic, W Germany) **["Inhibition": Its medical definition.]** (Germ) *Nervenarzt*, 1972(Mar), Vol 43(3), 136-142.—Presents a theoretical discussion of the definition, inner meaning, and use of the term "inhibition" in medicine. The most important literature and research is briefly reviewed, with the criticism that most concepts reflect a causal way of thinking. Such an approach combines elements of observation with elements of conjecture and thus does not fulfil the requirement for a strict separation between hypotheses, phenomena, and interpretation. Other shortcomings of the causal approach are examined and an alternative—a new, causality-free approach to definition—is suggested. (29 ref)—*T. Fisher.*

1171. **Bendo, Audree A. & Feldman, Harold.** **A comparison of the self-concept of low-income women with and without husbands present.** *Cornell Journal of Social Relations*, 1974(Spr), Vol 9(1), 53-85.—Hypothes-

ized that (a) husband-absent women have a stronger self-concept and (b) husband-present women are more satisfied with their life circumstances. Stronger self-concept was defined as having higher self-esteem, lower second sex attitudes, a more instrumental self-concept, a feeling of greater optimism about the future, and an internal self-concept. Greater satisfaction was defined as experiencing more satisfaction with work, personal and traditional female areas of concern, health, and financial situation. Data from interviews with 1,325 low income women support the hypotheses. The research design was a  $2 \times 2 \times 2$  analysis of variance with 2 welfare groups (presently welfare and previously welfare), 2 employment groups (working and nonworking), and husband-present and husband-absent groups. (17 ref)—*Journal abstract.*

1172. **Bradshaw, Samuel L.** (Topeka VA Hosp, KS) **A psychoanalytic view of music composition.** *Confinia Psychiatrica*, 1973, Vol 16(3-4), 220-237.—Explores some of the implications of psychoanalytic theory for understanding the nature of music and music composition as human phenomena. Experience as a composer is used as the background in describing the process of composition and in speculating on the metapsychology of this phenomenological description. The major thesis is that the sets of experiences and models which go into developing a composer's style can be conceptualized as the development of a musical superego which bears some resemblance to the earlier developed superego of the artist.—*Journal abstract.*

1173. **Braithwaite, Ronald.** (Michigan State U) **A paired study of self-disclosure of black and white inmates.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Jan), Vol 1(2), 86-94.—Administered S. L. Brodsky and J. Twomey's 1967 version of the Self-Disclosure Questionnaire to 30 black and 30 white 20-44 yr old inmates in a federal penitentiary. The questionnaire assessed the degree to which Ss would disclose themselves to different target persons in the prison population (e.g., social worker, warden, or other inmates). Data show that both black and white Ss felt most comfortable in relating to their "closest inmate friend," followed by "expert in the field." Both groups exhibited dichotomies as to which staff personnel were viewed as unsafe confidants when compared to other inmates and family members. Both groups also exhibited feelings of distrust for members of the other race, although this was greater in the white group than in the black group. Implications for the rehabilitation process and personnel recruitment are discussed.—*L. Gorsey.*

1174. **Bryant, Brenda K.** (U California, Davis) **Reliability of the Interpersonal Perception Method modified for use with children.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1307-1311.—Adapted Liang's Interpersonal Method scale for use with children. Administration of the scale to 40 male 6th graders produced reliable data based on a measure of internal consistency. The reliability permits further use of the modified Interpersonal Perception Method with 10-yr-old children. Also considered were respondents' attitudes toward locus of control as indicated by the Intellectual Achievement Responsibility Questionnaire. The relationship between attitudes toward locus of control and

reliability of the Interpersonal Perception Method is discussed.—*Journal abstract.*

1175. Brzezińska, Anna & Kofta, Mirosław. (Mickiewicz U, Inst of Pedagogics, Poznań, Poland) **Stability of self-image tolerance to stress and anxiety.** *Polish Psychological Bulletin*, 1974, Vol 5(1), 3-10.—Hypothesized that there is a positive correlation between tolerance of stress and stability of self-image. A specially constructed measure of self-image and a standardized clinical interview to evaluate tolerance of stress were given to 50 female undergraduates. The self-image measure was administered twice—in an emotionally neutral situation and 2 mo later in a waiting situation. The relationship between anxiety and stability of self-image was also assessed using continuous and discontinuous self-reports of test anxiety. Results show that (a) in spite of the generally high level of anxiety in the entire sample, "stable" Ss displayed less anxiety than "unstable" Ss; (b) stress tolerance and stability of self-image were significantly positively correlated, and (c) among Ss with similar anxiety levels, stable and unstable Ss did not differ in stress tolerance. Results suggest that anxiety performs a mediating function between self-image and stress tolerance. (29 ref)—*L. Gorsey.*

1176. Burdsal, C. A. & Cattell, R. B. (Wichita State U) **A definitive second order factor analysis of the personality structure in high school age children.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 173-177.—Performed a factor analysis combining High School Personality Questionnaire (HSPQ) forms A and B scores for 1,504 male and 1,255 female high school students. 8 factors were extracted and rotated from each of the 2 groups. It was found that the resulting factor patterns were both clearer (had better simple structure) and more closely matched the 2nd-order factor structure found among adults than previous HSPQ structures. Results support the contention that (a) there are comparable 2nd-order personality factors between adults and high school students and (b) since the factor pattern was similar to patterns found previously, the primary factors tend to be stable.—*Journal abstract.*

1177. Cartwright, Rosalind D. (U Illinois, Chicago Circle) **The influence of a conscious wish on dreams: A methodological study of dream meaning and function.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 387-393.—Used a self-ideal-self trait discrepancy, identified from Q sorts for 19 college students, as a presleep stimulus. Ss were instructed to wish to change their trait so as to reduce the discrepancy. Dream reports were collected for each rapid eye movement period that followed. It was found that a blind judge rated the target trait as present in the dreams of a significant number of the Ss. 2 other nontarget control traits were not rated present in the dreams of a significant number of the Ss. Few Ss had dreams in which the ideal trait was ascribed to the self. Dreaming thought, while responsive to the instruction to attend to that trait, revealed a difference in emotional value from that stated in waking.—*Journal abstract.*

1178. Cegalis, John A. & Young, Robert. (Syracuse U) **Effect of inversion-induced conflict on field dependence.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 373-379.—Verbal reports of loss of control and

surrender to powerful visual changes, experienced during inversion of the visual world in previous studies, suggest changes in field dependence. In the present study with 40 undergraduates, field dependence (rod-and-frame test vertical was tested under conditions of inversion and noninversion. Significantly greater field dependence was observed for Ss exposed to complete inversion rotation of the rod-and-frame configuration in the experimental period than for Ss exposed to rotation without inversion, partial rod-and-frame inversion rotation, or inversion rotation without a frame. The change in field dependence was not significantly affected by 10 min of active experience with inversion, and no significant aftereffects were observed. Results are interpreted in terms of the effect of conflict on perceptual-cognitive decentering. Implications for perceptual adaptation and personality theory are discussed. (27 ref)—*Journal abstract.*

1179. Corder, Billie F. & Corder, Robert F. **A study of the relationship of IQ and cognitive and personality rigidity to performance on concept learning tasks.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 83-90.—Administered a concept-learning test to 113 college sophomores with an average-to-superior IQ range, who had been tested previously on 2 measures of cognitive rigidity, a measure of personality rigidity, and the Wechsler Adult Intelligence Scale (WAIS). The concept-learning test included simple, disjunctive, and relational types of problems which were randomly presented and required Ss to vary their approach from task to task. Scores on the Alternate Uses Test of cognitive flexibility were significantly related to concept-learning scores. The figural Adaptive Flexibility Test of cognitive flexibility, Rokeach Dogmatism Scale, and WAIS scores showed no significant relationship to concept learning on these tasks. It is hypothesized that cognitive flexibility, as measured by the Alternative Uses Test, may represent an important dimension of learning behavior which is not measured by a standardized IQ test composed of items emphasizing convergent thinking.—*Journal abstract.*

1180. Darden, William R. & Reynolds, Fred D. (U Georgia) **Backward profiling of male innovators.** *Journal of Marketing Research*, 1974(Feb), Vol 11(1), 79-85.—Presents a multivariate conceptualization of male innovative behavior which calls for grouping consumers in the innovative behavior space for several product categories, and determining if consumer characteristics can differentiate between them. This methodology was applied to a survey of 154 male heads of household in 9 medium to upper middle-class suburban neighborhoods. Ss were interviewed about demographic, socioeconomic, activity, interest, and psychological (e.g., self-esteem, attitude toward change, and venturesomeness) variables that have been reported as significant in describing innovators. As predicted, results show that "natural" groups of innovators can be identified from innovative behavior measures of several product categories. Discriminant analyses suggest that consumers with different innovative behavior profiles have different consumer characteristics. 4 innovator groups, based on examination of group characteristics, readership, listening, and viewing habits, are described: suburban swinger, subur-

ban conservative, house-husband, and established suburbanite. (18 ref)—*L. Gorsey.*

1181. Delaney, James G. & Woodyard, Howard D. (U Windsor, Ontario, Canada) **Effects of reading an astrological description on responding to a personality inventory.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1214.—16–18 yr old high school students read astrological personality descriptions, presumably applicable to them, which had previously been rated as high or low on Dominance and Change. Ss then completed the Dominance and Change subscales of the Personality Research Form. As predicted, self-reports were influenced by the astrological personality description.

1182. Diener, Robert G. & Maroney, Robert J. (DC Dept of Human Resources, Institutional Care Services Div, Laurel, MD) **Relationship between Quick Test and WAIS for black male adolescent underachievers.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1232–1234.—Although the Quick Test underestimated Wechsler Adult Intelligence Scale (WAIS) IQs at the lower ranges of intelligence, it approximated WAIS IQs adequately as the average range was approached. It is recommended that a regression equation based on local norms be computed to minimize the risk of misclassifying black male adolescent underachievers.

1183. Dimsdale, Joel E. (Harvard U, Medical School, Boston) **The coping behavior of Nazi concentration camp survivors.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 792–797.—Reports on interviews with 19 survivors of Nazi concentration camps. The Ss, relatively healthy survivors who were not severely psychiatrically disabled, were interviewed in Jerusalem and the San Francisco Bay area. A classification of coping strategies in extreme stress situations—drawn from the interview data—are presented, and the long-term effectiveness of certain of these strategies is discussed.—*Journal abstract.*

1184. DiRenzo, Gordon J. (U Delaware) **Congruencies in personality structure and academic curricula as determinants of occupational careers.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1295–1298.—A total of 198 male undergraduates, categorized by their type of curricula (Behavioral Sciences, Liberal Arts, Business Administration, or Physical and Natural Sciences), were administered Form E of the Rokeach Dogmatism scale. Major curriculum-career areas could be distinguished by significant differences in personality structure, which is considered to serve as a channeling factor in determining broad areas of one's choices for occupational careers.—*Journal abstract.*

1185. Ebersole, Peter. (California State U, Fullerton) **Impact of literary works upon college students.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1127–1130.—Attempted to determine what type of impact, if any, is reported by college students concerning the reading of literary works they consider important. Ss were 56 students in a class on the psychological interpretation of literature. The effects Ss reported were grouped into 3 major categories: no effect, behavioral effects, and cognitive effects, the latter being the most frequently reported. Results provide support for both the aesthetic (style-oriented) and moralistic (content-oriented) interpretation of the value of literature. Justification of

literature might be most fruitfully approached via cognitive rather than behavioral impact.—*Journal abstract.*

1186. Farley, Frank H. (U Wisconsin, Madison) **Field dependence and approval motivation.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 153–154.—Administered the Marlowe-Crowne Social Desirability scale and Messick and Jackson's Hidden Figures Test to undergraduates. Contrary to P. R. Pearson's 1972 findings, no significant relationship was obtained between field independence and social desirability response set.

1187. Feather, N. T. & Raphelson, Alfred C. (Flinders U South Australia, Bedford Park) **Fear of success in Australian and American student groups: Motive or sex-role stereotype?** *Journal of Personality*, 1974(Jun), Vol 42(2), 190–201.—126 male and 88 female Australian and 83 male and 113 female American undergraduates wrote stories to a verbal cue in which either a male or a female succeeded. Half of the male and half of the female Ss wrote to the male cue, and the other half to the female cue. Stories were scored for fear of success as indicated by a concern that success might have negative consequences. Results indicate that both male and female Australian Ss and American males wrote a higher proportion of fear of success stories to the female cue than to the male cue. This difference was not evident among American females, who wrote a much lower proportion of fear of success stories to the female cue than did the Australian females. The proportion of fear of success stories to the female cue in both samples was lower than that reported by M. S. Horner in her 1968 study, and the proportion of fear of success stories to the male cue in both samples was higher. Results are discussed in terms of social stereotypes of male and female achievements, the effects of social movements (e.g., women's liberation) on redefinitions of sex roles, and whether the procedure tapped motives, stereotypes, or both.—*Journal summary.*

1188. Friedman, Ronald J. (Ontario Inst for Studies in Education, Toronto, Canada) **MMPI characteristics of mothers of pre-school children who are emotionally disturbed or have behavior problems.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1159–1162.—Compared the Minnesota Multiphasic Personality Inventory profiles of 33 mothers of preschool children who were emotionally disturbed or had behavior problems with those of a control group of mothers. Compared to controls, mothers of children with emotional problems had significantly higher scores on Depression, Psychopathic Deviate, Psychasthenia, Schizophrenia, and Hypomania scales. Mothers of children with behavior problems differed from controls only on the Hypomania scale. The significance of these results is discussed in terms of their contribution to the resolution of the question as to whether or not maternal maladjustment is a causative factor in deviant behavior in children or simply a reaction to a problem child.—*Journal abstract.*

1189. Ginsberg, Aniela M. (Catholic U São Paulo, Brazil) **A comparison of personality indicators across three cultural groups.** *Revista Interamericana de Psicologia*, 1974, Vol 8(1–2), 87–92.—Administered the Holtzman Inkblot Technique (HIT) to 186 university students

in 3 subgroups: Brazilians of the 4th generation or more, niseis or 1st generation Brazilians of Japanese descent, and Japanese studying in Tokyo. The groups were further subdivided according to father's educational level. Scores on 33 variables from the HIT were analyzed according to ethnic origin and father's education. Numerous statistically significant differences suggest that the HIT variables differentiated between ethnic groups with respect to precision and integration of perceptions, creative fantasy, anxiety, oppositional and disphoric affective attitudes, social adaptability, and special interests. (Portuguese summary)—*Journal abstract*.

1190. Good, Patricia K. & Brantner, John P. A practical guide to the MMPI: An introduction for psychologists, physicians, social workers, and other professionals. Minneapolis, MN: University of Minnesota Press, 1974. 102 p.—Provides individuals whose formal training did not include detailed information on the use of the Minnesota Multiphasic Personality Inventory (MMPI) with research results and clinical opinions about MMPI interpretation. The volume is also designed as a guide for test applications in specific circumstances.

1191. Grofman, Bernard & Hyman, Gerald. (State U New York, Stony Brook) The logical foundations of ideology. *Behavioral Science*, 1974(Jul), Vol 19(4), 225-237.—Demonstrates that 149 undergraduates' assignments of probabilities to a set of 15 interrelated propositions are highly consistent with a formal model of belief systems which satisfies the axioms of probability theory and propositional logic and which is based on the operation of symmetric difference. The model allows subjectively perceived truth-functional relationships between propositions in a belief system to be imputed to actors on the basis of their subjective probability assignments to these propositions and their pairwise conjunctions. The model also enables measures of the distance between sets of beliefs, of the congruence and consistency of belief systems, and of the degree of polarization of belief systems to be derived. (29 ref)—*Journal abstract*.

1192. Gupta, G. C. (U Delhi, India) Articulatness of the field and cognitive styles. *Journal of General Psychology*, 1974(Jul), Vol 91(1), 3-8.—Instructed each of 30 postgraduate students, seated in a chair in an upright posture in a dark room, to set a luminescent rod to the apparent vertical under 3 visual field conditions: Rod ONLY, Rod in Circle, and Rod in Square. In an analysis of variance of the deviations of the apparent from its objective position, significant effects were found for Initial Starting Positions of the Rod, Sex  $\times$  Positioning of the Rod being either Clockwise or Counterclockwise by Fields, and the error component of Within-group Ss  $\times$  Fields. Results suggest that in the event of nonexcitation or deficient adaptation to postural cues, articulateness of the field generates sex differences, taken to be an index of the presence of cognitive styles. A proposal for a new test of field dependence-independence is formulated.—*Journal abstract*.

1193. Halpin, Gerald; Halpin, Glennelle & Torrance, E. Paul. (U Georgia) Relationships between creative thinking abilities and a measure of the creative

personality. *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 75-82.—Studied the relationships between a creative personality measure, the What Kind of Person Are You? test, and 3 verbal and 4 figural creative ability measures derived from the Torrance Tests of Creative Thinking. Ss were 65 male and 164 female undergraduates enrolled in an introductory course in educational psychology. For the males, multiple coefficients of correlation were .57 for all 7 creative ability measures, .42 for the 3 verbal measures, and .51 for the 4 figural measures ( $p < .01$ ). For the females, multiple coefficients of correlation were .33 for all 7 measures, .22 for the 3 verbal measures, and .30 for the 4 figural measures ( $p < .05$ ).—*Journal abstract*.

1194. Hammer, W. M. & Tutko, T. A. (U California, Santa Barbara) Validation of the Athletic Motivation Inventory. *International Journal of Sport Psychology*, 1974, Vol 5(1), 3-12.—Correlated the Athletic Motivation Inventory (AMI) with the variables on the Cattell 16 Personality Factor (PF), Forms A and B. Of the AMI variables, emotional control, aggression, leadership, conscientiousness, tough-mindedness, trust, self-confidence, and guilt-proneness were considered to measure the traits similarly named on the 16 PF; i.e., Factor C, emotionally stable; Factor E, assertive; Factor G, conscientious; Factor I, tenderminded; Factor L, suspicious; Factor O, apprehensive; and Factor Q4, tense. The intercorrelations were very low, with the greatest amount of shared variation reaching only 30%. Of the 8 possible correlations, 7 were significant when Form A of the 16 PF and the AMI were intercorrelated. Guilt-proneness and emotional control were not found to be significantly correlated. When Form B was used, 8 of the 9 were significantly correlated.—*Journal abstract*.

1195. Heiman, Nanette & Grant, Joan. Else Frenkel-Brunswick: Selected papers. *Psychological Issues*, 1974, Vol 8(3, Mono 31), 333 p.—Publishes and discusses 7 of Else Frenkel-Brunswick's papers, emphasizing her contributions to theoretical psychology; her major empirical studies do not appear in this volume but are liberally quoted. The 7 papers are: "Psychoanalysis and Personality Research"; "Intolerance of Ambiguity as an Emotional and Perceptual Personality Variable"; "Personality Theory and Perception"; "Psychoanalysis and the Unity of Science"; "Interaction of Psychological and Sociological Factors in Political Behavior"; "Environmental Controls and the Impoverishment of Thought"; and "Some Theoretical and Empirical Aspects of the Problem of Values." A brief professional biography and a descriptive bibliography are included.—E. Coles.

1196. Hendry, L. B. (U Aberdeen, Scotland) Coaches and teachers of physical education: A comparison of the personality dimensions underlying their social orientation. *International Journal of Sport Psychology*, 1974, Vol 5(1), 40-53.—Studied similarities and differences in the personalities of coaches and physical education teachers. 63 coaches and 48 male physical education teachers in the United Kingdom completed the Dynamic Personality Inventory. Test scores were analyzed for significant differences between groups and for comparisons of "total" personality. Results indicate close similarities in only 2 factors—Dominance and Authoritarianism. A number of significant differences in

other personality dimensions were found, suggesting a quite separate "coach" and "physical education teacher" archetype. Comments on the differing approaches of the 2 types to social interaction are given. (23 ref)—*Journal abstract*.

1197. Houston, B. Kent & Holmes, David S. (U Kansas) **Effect of avoidant thinking and reappraisal for coping with threat involving temporal uncertainty.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 382-388.—Investigated the use of avoidant thinking as a means of coping with stress. The focus of the study was on stress under conditions of temporal uncertainty where threat was manipulated by telling 48 male undergraduates either that they would or would not receive electrical shocks sometime during the experimental period. The use of avoidant thinking during the experimental period was manipulated by instructing half of the threatened and half of the nonthreatened Ss to read an interesting story that kept them cognitively occupied. No distraction was provided for the remaining Ss. Contrary to the predictions, physiological measures of stress indicate that threatened Ss who used avoidant thinking showed more rather than less stress than threatened Ss who did not use avoidant thinking. Additional analyses revealed that threatened Ss who were not instructed to use avoidant thinking took the opportunity to reappraise the threat as less serious and thereby reduced their level of stress. Ss who used avoidant thinking were apparently unable to effect the reappraisal, and therefore their stress remained high.—*Journal abstract*.

1198. Jansen, Abraham. (U Amsterdam, Netherlands) **Validation of graphological judgments: An experimental study.** The Hague, Netherlands: Mouton, 1973. xiv, 189 p.—Describes a series of 4 related experiments which assessed the validity of personality judgments made by graphologists. The statistical calculations and analysis of outcomes are the results of both simple counts of hit results by graphologists and control groups—as against chance expectation—and of sophisticated psychometric techniques. (9 p ref)

1199. Johnson, Donald M. & Fogel, Max L. (Eastern Pennsylvania Psychiatric Inst, Philadelphia) **Creative aptitudes in a high intelligence population.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 93-104.—Analyzed scores from a multiaptitude test battery administered to 93 Ss (mean age = 35 yrs), all of whom had IQ scores within the top 2% on standard intelligence test norms. The battery contained 12 subtests. 5 were developed specifically to assess aptitudes which have been associated with creative thinking: 3 production (divergence) tests, a redefinition test, and a verbal sequencing test. Results demonstrate that the verbal battery discriminated reliably at high intelligence levels. Since only 12 of the 66 intercorrelations were higher than .30, a major test design objective of achieving subtest independence was satisfied. The low creativity subtest intercorrelations suggest infrequency of high creative aptitude combinations among high-IQ persons. This notion is supported by the aptitude combination frequencies obtained.—*Journal abstract*.

1200. Karabenick, Stuart A. & Marshall, Joan M. (Eastern Michigan U) **Performance of females as a**

**function of fear of success, fear of failure, type of opponent, and performance-contingent feedback.** *Journal of Personality*, 1974(Jun), Vol 42(2), 220-237.—279 female undergraduates performed a substitution task opposite a male, a female, or no opponent under achievement-oriented conditions. Ss were then given feedback indicating that they had either succeeded, failed, or performed the same as their opponents (or norms), followed by a 2nd performance trial. Fear of success (FS) was measured by a projective test in which Ss told stories in response to verbal cues, and fear of failure (FF) was measured by the Debilitating Anxiety scale of the Alpert-Haber Achievement Anxiety Test. Mean performance improvement was found to be related to individual differences in FS, FF, and type of opponent. Performance trends were consistent with data from M. S. Horner's 1968 study for Ss low in FF, but not for those high in FF. Low FF Ss improved more after failure than after success while high FF Ss improved more following success than failure, results which were previously found with males. Several self-ratings of affective reactions to performance were related to both personality and situational variables.—*Journal summary*.

1201. Katan, Anny. **The infant's first reaction to strangers: Distress or anxiety?** *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 501-503.—Describes the pleasure reactions of the baby to the mother's face and the distress caused by a stranger's face. This attribution of anxiety to an infant may be a mistake made by adults, who cannot comprehend the undifferentiated feelings of a child. With the development of the secondary process and the establishment of object-constancy, feelings change not only in their quantity and intensity but in their quality. Only after object-constancy is fairly well established and the secondary process prevails, can it be assumed that the feelings of the small child—grief, anxiety, sadness, anger, etc.—are differentiated and experienced in approximately the same way as those of adults.—*R. S. Albin*.

1202. Koenig, Frederick & Seaman, Jerrol. (Tulane U) **Comparison of cognitive complexity of male and female subjects responding to male and female stimuli.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1345-1346.—Administered the Role Repertory Test to 172 undergraduates. Half of the right stimulus objects in the test were male and half were female. Results show that male stimulus objects elicited higher cognitive complexity scores and that male Ss were higher in cognitive complexity.—*Journal abstract*.

1203. Krovetz, Martin L. (Claremont Men's Coll) **Explaining success or failure as a function of one's locus of control.** *Journal of Personality*, 1974(Jun), Vol 42(2), 175-189.—Determined whether internal and external persons attribute different causes to success or failure on an experimental task. 60 undergraduates who were external and 60 who were internal, as measured by Rotter's Internal-External Control Scale, judged which of 3 African words had the same meaning as an English word for 70 trials. Ss were told by E whether their responses were correct or incorrect according to 1 of 5 reinforcement schedules. In 4 of the 5 reinforcement conditions, internal Ss stressed skill components of the task more than did external Ss. External Ss indicated that

chance was an important determinant of outcome. In the extreme success condition, internals used external attributes to explain their success while external Ss used internal attributes. Data suggest that the underlying cognitive processes for internals are quite different from those of externals.—*Journal summary*.

1204. Levenson, Hanna. (Texas A&M U) **Activism and powerful others: Distinctions within the concept of internal-external control.** *Journal of Personality Assessment*, 1974(Aug), Vol 38(4), 377-383.—Developed 3 new 8-item Likert-type scales to measure belief in chance (C), as separate from expectancy for control by powerful others (P), and perceived mastery over one's personal life (I). In Study 1, 96 adults completed the 3 scales in addition to an involvement activities checklist and a measure of knowledge about pollution. As predicted, only a belief in chance was differentially related to involvement and information on antipollution issues. In Study 2, a factor analysis of the responses of 329 male undergraduates to the 3 scales demonstrated the existence of the 3 main factors—I, P, and C. The validity and usefulness of the tripartite division in clarifying previous findings on the multidimensionality of internal-external control are discussed. (15 ref)—*Journal abstract*.

1205. Liebert, Robert M. & Spiegler, Michael D. (State U New York, Stony Brook) **Personality: Strategies for the study of man.** (Rev ed). Homewood, IL: Dorsey, 1974. xvi, 454 p. \$11.—Presents revised edition of a 1970 text (see PA, Vol 44:12) which introduces the student to theoretical and practical issues in psychology, applies psychology to important human concerns, and includes research examples which typify scientific methodology and investigation. Psychoanalytic, dispositional, phenomenological, and behavioral viewpoints are stressed. (19 p ref)

1206. Masling, Joseph; Johnson, Cynthia & Saturansky, Carol. (State U New York, Buffalo) **Oral imagery, accuracy of perceiving others, and performance in Peace Corps training.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 414-419.—Conducted 2 experiments to test the psychoanalytic theory that suggests that people with oral characteristics should be dependent on others and should develop skills in predicting the responses of others. Exp I used 32 male and 34 female previously unacquainted students. The Es found that males who reported many oral images were better than low-oral males at predicting male personality test responses. Orality was unrelated to accurate perception by males or females or to accuracy of females' interpersonal perception. To corroborate this finding, 33 male and 14 female undergraduate Peace Corps trainees, previously well acquainted, were studied. Results were identical: Orality was significantly related to accurate interpersonal perception for males predicting males but only in that case. The independent assessment of fitness for Peace Corps work was positively related to both oral imagery and accurate interpersonal perception. (18 ref)—*Journal abstract*.

1207. Medeiros, Elizabeth E. & McManis, Donald L. (Eastern Washington State Coll) **Assessment of introversion-extraversion in children: Brief report.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 429-430.—Attempted to replicate the results of J. Casey and D. L. McManis,

showing that high-extravert children salivated significantly less to lemon juice than did low-extravert children. Results were negative. Although group differences were in the predicted direction, the differences were nonsignificant, with the differences more marked for 18 girls than for 18 boys. A visual vigilance task also failed to produce significantly fewer correct responses by high-extravert children than by low-extravert children, as predicted by H. J. Eysenck's formulation. The prediction of faster but less accurate motor performance by high extraverts than by low extraverts was confirmed, although the results were significant only for the boys.—*Journal abstract*.

1208. Morf, Martin E. (U Windsor, Ontario, Canada) **The three levels of generalizability.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1139-1146.—Examined the theory of generalizability by L. J. Cronbach et al (1972) and J. Loewinger's (see PA, Vol 33:3850) analysis of construct validity in an effort to extend the concept of generalizability and to reformulate some aspects of Loewinger's analysis. 3 levels of generalizability emerged: generalizability from scale score to location on an unspecified personality dimension (reliability), from scale score to location on a vertically defined personality dimension (trait validity), and from scale score to location on a vertically and horizontally defined personality dimension (nomological validity). (26 ref)—*Journal abstract*.

1209. Morse, Stephen J. (Harvard U) **Structure and reconstruction: A critical comparison of Michael Balint and D. W. Winnicott.** *International Journal of Psychoanalysis*, 1972, Vol 53(4), 487-500.—Reviews and compares the theoretical approaches of 2 psychoanalysts, Michael Balint and D. W. Winnicott both of whom are provocative and unorthodox in theory and practice. It is suggested that despite their use of different terminology they have constructed similar conceptual frameworks to explain the essentially similar data found in their analyses of borderline and deeply regressed patients. Both speak of the mismatch between the psychobiological needs of the infant and the reality of his environment as the source of later problems. Balint and Winnicott are seen as having discovered data calling for fundamental reconstruction of psychoanalytic theory without fully carrying out the reconstruction themselves. (17 ref)—R. S. Albin.

1210. Moylan, Mary. (St Louis U, Columban Coll, Olongapo City, Philippines) **The happiness values of selected Filipino adolescent and young adult students in a provincial city.** *Saint Louis University Research Journal*, 1973(Mar), Vol 4(1), 1-121.—Attempted to discover the meaning framework and happiness values of 540 18-22 yr old Ss (½ male and ½ female) divided into 3 age levels. Perceived socioeconomic level and perceived academic ability were decided by each S. The Philippine Survey of Happiness Values was administered, and condensed into 70 statements in 10 major categories: spiritual outlook; personal freedom; physical health; physical ambition; emotional stability; family relationships; future; materialistic outlook; social relationships; and sex, drugs, and modern trends. Results indicate that no sex differences in happiness appeared among 18- or 22-yr-olds, nor between seniors in public and private high schools.

Spiritual outlook was the happiness value ranked highest. (31 ref)—*R. S. Albin*.

1211. **Mueller, Ernst F. & French, John R.** *Uric acid and achievement. Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 336-340.—Results of a study with male university professors indicate that (a) serum uric acid correlated .50 with achievement-oriented behavior, (b) neither of 2 measures of achievement motivation correlated with serum uric acid, and (c) serum uric acid was not related to either of 2 measures of actual achievement.

1212. **Muller, Douglas & Leonetti, Robert.** (New Mexico State U.) *Self-concepts of primary level Chicano and Anglo students. California Journal of Educational Research*, 1974(Mar), Vol. 25(2), 57-60.—Compared the self-concepts of low-income Chicano and Anglo children in kindergarten through 4th grade, using the Primary Self-Concept Scale by R. Leonetti. The only difference between the 2 groups occurred at the kindergarten level, with Anglo Ss having significantly higher self-concepts ( $p < .05$ ).

1213. **Patrick, Audrey W.; Zuckerman, Marvin & Masterson, Fred A.** (U Delaware) *An extension of the trait-state distinction from affects to motive measures. Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1251-1258.—Explored the feasibility of using the Adjective Check List as a measure of motive states as well as of motive traits, using 37 undergraduates. Ss took the Adjective Check List as a trait test, 11 times as a state test, and again as a trait test. For all 23 scales, the mean of the states was a significantly better measure than a generalized trait of day-to-day states. Retest reliability was significantly higher for trait than state measures for all scales. Communalities, indicative of a trait component in a state measure, was present in all scales except Exhibitionism and Aggression scales. A sample of states (as few as 2) provided a reasonable estimate of the mean of states. (30 ref)—*Journal abstract*.

1214. **Phillips, Victor K. & Hudgins, Anne L.** (U Georgia) *Relationship between creativity, sex, and rule-orientation behavior. Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1163-1171.—Investigated how levels of rule-orientation behavior and sex relate to creative functioning. 30 male and 30 female undergraduates were given the Arrow-Dot task from the Id-Ego-Superego Test to derive high and low levels of 3 rule-orientations: rule-governed, rule-violation, and rule-overconformity. Ss were also administered the Circles task from the Torrance Tests of Creative Thinking to obtain indexes of originality and elaboration.  $6.2 \times 2$  factorial analyses of variance, with originality and elaboration as dependent variables, sex and level of rule-orientation behavior as independent variables provided tests of 3 hypotheses: (a) females high in rule-governed behavior will be more creative than males high in rule-governed behavior, (b) females high in rule-violation behavior will manifest less creative ability than males high in rule-violation behavior, and (c) females showing high rule-overconformity behavior will be more creative than males high in rule-overconformity. The 1st hypothesis was partially confirmed as reflected in the main effects for rule-governed levels but the other

hypotheses were not supported. (26 ref)—*Journal abstract*.

1215. **Roberts, Glyn C.** (U Illinois, Children's Research Ctr) *Effect of achievement motivation and social environment on risk taking. Research Quarterly*, 1974(Mar), Vol 45(1), 42-55.—Investigated the risk-taking choices of male undergraduate Ss performing a motor task. 50 achieve-success Ss and 50 avoid-failure Ss (selected by the French Test of Insight and Sarason's Test Anxiety Scale) practiced a modified shuffleboard task from which empirical probabilities of success were found for each S. Ss were randomly placed into 1 of 5 competitive treatment levels—alone, presence of others, interpersonal competition, intergroup competition, and interpersonal and intergroup competition. Each S was given 20 free-choice trials. Achieve-success Ss preferred intermediate risk choices to a significantly greater extent than avoid-failure Ss. Avoid-failure Ss preferred extreme-risk choices to a significantly greater extent than low- or intermediate-risk. No competitive treatment effects were noted. (30 ref)—*Journal abstract*.

1216. **Ross, Nathaniel.** (State U New York, New York City) *Man's struggle for freedom: A psychoanalytic inquiry into the individual and social dimensions of human autonomy. Bulletin of the Menninger Clinic*, 1974(May), Vol 38(3), 209-221.—Discusses today's threats to freedom, which are so awesome in their magnitude that most people dread confronting them. Psychoanalysis takes a strong positive position on the issue of freedom; the aim of psychoanalytic therapy does not include acceptance of the status quo in the social order. The need for behavioral scientists to address themselves to current social, political, and economic phenomena is strongly voiced. (18 ref)—*J. Z. Elias*.

1217. **Ryckman, Richard M. & Malikiosi, Maria.** (U Maine, Orono) *Differences in locus of control orientation for members of selected occupations. Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1224-1226.—Administered a locus of control measure by H. Levenson (1972) to college students, workers, and professionals. Results support the predictions that professionals would believe they exercise more personal control over events and would perceive their reinforcers as occurring more predictably than would the other 2 groups. No group differences were found in perceived extent of control by powerful others.

1218. **Savastano, Helena & de Domini, Juliana.** (U São Paulo, Faculty of Public Health, Brazil) [The Visual Motor Gestalt Test in adults: Preliminary study.] (Port) *Revista de Psicologia Normal e Patológica*, 1970(Jul), Vol 16(3-4), 221-233.—Establishes a preliminary Index of Neuroticism in adults using the Bender-Gestalt Visual Motor Test. The objectives were (a) to verify the characteristics manifested in any emotional change in adults, using the Bender-Gestalt; (b) to obtain data discriminating difficulties in group adaptation; and (c) to construct an index of neuroticism. 27 items in 7 areas were used with 30 Ss in validating the index. (French & English summaries)—*N. T. Pinckney*.

1219. **Sell, John M. & Duckworth, Jane J.** (Ohio U) *Field-dependence, neuroticism, and extraversion. Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 589-590.—Used a multiple regression analysis to predict Mauds-

ley Personality Inventory extraversion scores from the rod-and-frame test (RFT), embedded-figures test, and Maudsley neuroticism scores of 66 undergraduate males. Results indicate that optimal weights of the neuroticism, embedded-figures, and RFT upright scores contributed to prediction.—*Journal abstract.*

1220. Sobel, Robert S. (Hunter Coll, City U New York) **The effects of success, failure, and locus of control on postperformance attribution of causality.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 29-34.—Measured valences for successful task performance and locus of control preference on Rotter's Internal-External (I-E) Scale, with 153 college students as Ss. The subjective probability of doing well on a task and reported success following performance of the task were manipulated within a factorial design. Following performance feedback, Ss scaled several internal and external factors in terms of their influence on task performance. As predicted, success produced attribution to internal factors, while failure produced attribution to external factors. External Ss tended to attribute their performance more to external and less to internal factors than did internals only in the failure condition. It is suggested that the overemphasis of failure-oriented items in the I-E scale could account for this effect.—*Journal abstract.*

1221. Stewart, Abigail J. & Winter, David G. (Harvard U) **Self-definition and social definition in women.** *Journal of Personality*, 1974(Jun), Vol 42(2), 238-259.—Developed a scoring system for Thematic Apperception Test (TAT) stories written by female undergraduates who planned full-time careers (with or without marriage) and those written by female undergraduates who planned marriage (without a career). The scoring system was hypothesized to measure self-definition vs social definition, was constructed with data from 1 sample of 49 Ss, and was cross-validated with data from a 2nd sample of 57 Ss. The measure was uncorrelated with intelligence, social class, and traditional measures of sex-role or sex differences (e.g., the Masculinity-Femininity scale of the Strong Vocational Interest Blank and the Femininity scale of the California Psychological Inventory). Self-defining Ss (a) tended to have working mothers and no older brothers; (b) reported a variety of instrumental actions; and (c) reported pleasures, fears, and secrets that suggested a pattern of thought, feeling, and behavior no less coherent than the pattern shown by the more "traditional" socially defined Ss. The advantage of the TAT over questionnaire procedures for measuring this dimension is discussed. (31 ref)—*Journal summary.*

1222. Strahan, Robert. (Iowa State U) **Situational dimensions of self-reported nervousness.** *Journal of Personality Assessment*, 1974(Aug), Vol 38(4), 341-352.—Administered the Stimulus Situation-Response Inventory of Anxiety to 149 undergraduate and graduate students and 68 17-18 yr old factory apprentices. Factor analyses of the responses revealed 3 broad nervousness dimensions, characterized by social situations, situations of physical discomfort or potential bodily harm, and situations of disorder or disruption. The 1st 2 of these dimensions have been reported previously. The 3rd has not been noted conspicuously and may merit further

study. 3 Nervousness scales constructed from the factor analysis data showed test-retest (intervals of from one to several weeks) reliability coefficients of from .87 to .88. Internal consistency coefficients ranged from .86 to .89 for the college student sample and from .86 to .88 for the factory apprentices. Moderately strong correlations between the 3 scales were obtained for the students and strong correlations for the factory group. Correlation data from 7 other personality measures are also reported. (21 ref)—*L. Gorsey.*

1223. Switzky, Harvey N. & Haywood, H. Carl. (George Peabody Coll, Inst on Mental Retardation & Intellectual Development) **Motivational orientation and the relative efficacy of self-monitored and externally imposed reinforcement systems in children.** *Journal of Personality & Social Psychology*, 1974(Sep), Vol 30(3), 360-366.—Compared behavior maintenance capability of self-monitored reinforcement to that of externally imposed reinforcement and to 2 noncontingent control conditions in 160 children in Grades 2-5. Half of the Ss at each grade level were intrinsically motivated and half were extrinsically motivated. Self-reinforcement Ss selected their own performance standards and rewarded themselves whenever they obtained their prescribed level; external-reinforcement Ss were yoked to them so that the same behavioral standards were imposed but the reinforcers were administered externally. Results show that intrinsically motivated Ss maintained their performance longer than did extrinsically motivated Ss under self-reinforcement, while extrinsically motivated Ss showed greater performance maintenance than did intrinsically motivated Ss under external reinforcement. It is concluded that individual differences in motivational orientation must be considered in order to predict patterns of self-reward behavior. (23 ref)—*Journal abstract.*

1224. Tarantino, Onofrio. [Sexual and anatomic responses on the Rorschach test.] (Fren) *Revue de Psychologie et des Sciences de l'Éducation*, 1973, Vol 8(3), 287-298.—Reports a study of Zaire university students to determine popular responses. Percentage of sexual responses was higher than those reported for European and American Ss in similar studies.

1225. Tittler, Bennett I. (Capital District Psychiatric Ctr, Albany, NY) **A behavioral approach to the measurement of openness-to-experience.** *Journal of Personality Assessment*, 1974(Aug), Vol 38(4), 335-340.—Used the miniature situations approach to measure the concept of openness-to-experience in 105 undergraduates. A 38-item measure of openness was developed from work in encounter and sensitivity techniques and from S. Santostefano's original work with the miniature situations method. Before the openness measure was administered, Ss completed the Rokeach Dogmatism Scale and Fitzgerald's Experience Inquiry. 101 other Ss completed the openness measure in a self-report format. A factor analysis of the 38 miniature situation items resulted in 9 openness factors, 4 of which showed evidence of concurrent validity. Openness scores were significantly higher among Ss who responded to the self-report format. (16 ref)—*L. Gorsey.*

1226. Vuchinich, Rudy E. & Bass, Barry A. (Indiana State U) **Social desirability in Rotter's Locus of Control**

**Scale.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1124-1126.—Although significant correlations were obtained between the scores of undergraduates on the Marlowe-Crowne Social Desirability scale and Rotter's Internal-External (I-E) Control Scale, the relationship was not consistent throughout the range of I-E Scale scores.

1227. Ward, William C. & Cox, Patricia W. (Educational Testing Service, Princeton, NJ) **A field study of nonverbal creativity.** *Journal of Personality*, 1974(Jun), Vol 42(2), 202-219.—Conducted 2 studies to examine creative products submitted in response to a contest to discover whether creativity was related to the sex or socioeconomic status (SES) of the respondent and whether characteristics of the objects could be specified which would predict their level of rated creativity. Judges were research assistants in Study 1 and graduate students' wives in Study 2. No sex differences were found, but SES was significantly associated with creativity for those objects to which at least a moderate amount of effort had been devoted. Ratings of the objects on several simple dimensions (e.g., originality, attractiveness, humor, complexity, and effort) proved effective in predicting rated creativity. Judges differed on which dimension best predicted their creativity ratings, but differences between subsets of the objects were of greater importance than individual differences among judges in determining the bases on which the ratings were made. (19 ref)—*Journal summary*.

1228. Warnes, H. & Hill, G. (McGill U, Montreal, Quebec, Canada) **Gender identity and the wish to be a woman.** *Psychosomatics*, 1974, Vol 15(1), 25-29.—Presents a view suggesting the primacy of the female gender and the basic woman-envy on the part of males. (16 ref)

1229. Waterman, Caroline K. & Waterman, Alan S. (State U New York, Albany) **Ego identity status and decision styles.** *Journal of Youth & Adolescence*, 1974(Mar), Vol 3(1), 1-6.—Hypothesized that the decision processes used in coping with the identity crisis would be related to more general decision styles in that identity achievers and moratorium Ss would tend to be reflective in their conceptual tempo while foreclosure Ss would typically be impulsive. No prediction was made about Ss with identity diffusions. 92 male undergraduates were given an identity status interview and the Matching Familiar Figures Test. Results support the hypotheses. It was also found that identity diffusions were generally impulsive. Since conceptual tempo has been found to be well established in childhood, results have implications for the early prediction of adult identity status.—*Journal abstract*.

1230. Webster, Murray & Sobieszek, Barbara. (Johns Hopkins U) **Sources of self-evaluation: A formal theory of significant others and social influence.** New York, NY: John Wiley & Sons, 1974. xxi, 189 p. \$12.95.—Reviews the main concepts and problems of early formulations on the self taken from classical, theoretical, and empirical literature, presents recent experimental data on the self, and demonstrates the building of formal theory using experiments in a step-by-step process. (4½ p ref)

1231. Weiss, A. A. (Hebrew U Jerusalem, Israel) **Equivalence of three alternative forms of Benton's**

**Visual Retention Test.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 623-635.—Analyzed the stimulus composition of the 3 alternative forms of Benton's Visual Retention Test. The 3 forms differed from each other in lateral distribution and vertical placement of peripheral details, in equality of chances for the elicitation of stabilizations, internal distortions, and mirror rotations. When 106 7th graders were randomly assigned to perform 1 of the 3 forms, their mean "correct" and "error" scores were very close to each other. No significant influence of individual Ss on means was observed, and the power of specific figures to elicit errors by individual Ss was spread evenly. However, the contribution of individual stimuli in each form to total error score was spread widely. Earlier findings as to differential frequency of the various error categories were confirmed for each form. Concentrations of certain errors in particular figures are discussed and tentative interpretations are advanced. Certain changes are proposed to equate the 3 forms qualitatively and increase the discriminative power of the instrument.—*Journal abstract*.

1232. Wilkinson, Gregg S. (Duke U, Medical Center) **Social psychological dimensions of resistance to psychiatric innovations.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1083-1085.—Attempted to isolate factors affecting staff resistance to innovations (e.g., adoption of the treatment team approach) in a state mental hospital. Results show that resistors had higher conservatism, dogmatism, and Machiavellianism scores and had less faith in people than did innovation acceptors.

1233. Zalesnik, Abraham. (Harvard U, Graduate School of Business Administration, Boston) **Charismatic and consensus leaders: A psychological comparison.** *Bulletin of the Menninger Clinic*, 1974(May), Vol 38(3), 222-238.—Examines the personality traits of the 2 types of leadership. Charismatic leaders are inner-directed, and will identify with objects, symbols, and ideals connected with introjects. The psychopathology of such leaders may include megalomania, paranoia, and other massive psychic upheavals. Consensus leadership, which has deep roots in the American national character, presents the leader as brother or peer rather than as father. Any leader will act or react in ways consistent with his personal style and with his habitual modes of managing internal and external conflict. It is suggested that personality factors have been underestimated in their capacity to determine how a chief executive will respond to the constraints and opportunities available to him. (19 ref)—*J. Z. Elias*.

## PROFESSIONAL PERSONNEL

1234. ———. [Papers presented at 3rd Brazilian Congress on Mental Deficiency: June 28-July 2, 1972: 1.] (Port) *Revista Brasileira de Deficiência Mental*, 1972(Sep), Vol. 7(3), 51 p.—Presents 11 papers in Portuguese and 2 in Spanish, dealing with professional training in the treatment of mental deficiency; with linguistic, psychological, social, pedagogical, vocational, and medical aspects of deficiency; with neuropsychomo-

tor development and mental disability; and with other related topics.—N. T. Pinckney.

1235. **Arbuckle, Dugald S.** (Boston U) **Theoretical, professional, and ethical issues in counselor education.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses theoretical issues surrounding the functions of the counselor and the effect of the counseling process. Professional issues (e.g., the state certification of counselor education programs) are also considered. Ethical issues concerning client change, the alienation of the student counselor, and the values of the counselor are examined. (36 ref)

1236. **Barrett-Lennard, G. T.; Kwasnik, T. P. & Wilkinson, G. R.** (U Waterloo, Ontario, Canada) **Some effects of participation in encounter group workshops: An analysis of written follow-up reports.** *Interpersonal Development*, 1973-1974, Vol 4(1), 35-41.—6 mo or longer after participating in a 2-wk basic encounter workshop, 62 mental health professionals completed a follow-up questionnaire. Their responses implied a range of frequently experienced changes in behavior and attitudes evidently resulting from their participation in the workshop. A system devised for classifying the mentioned and implied changes yielded a high level of interjudge agreement. Using this system, the participants' responses to the open-ended questionnaire items were classified. A pattern emerged from the obtained classification data which strongly suggests that the workshop experience led to an enduring change in level of self-regard for most of the participants and that this change contributed to associated persisting changes in interpersonal behavior and attitudes.—*Journal abstract*.

1237. **Berenson, Bernard G.** (American International Coll) **Confrontation: Those who qualify and those who do not.** *Canadian Counsellor*, 1974(Apr), Vol 8(2), 121-125.—Contends that confrontation is an abused technique which is sometimes used irresponsibly and is never sufficient in itself. People who confront must possess high levels of understanding, deep and appropriately changing levels of regard and affect, a high level of physical energy, and a large and growing repertoire of helping skills.

1238. **Boehm, Ann E.; Duker, Jan; Haesloop, Maryanne D. & White, Mary A.** (Teachers Coll, Columbia U) **Behavioral objectives in training for competence in the administration of individual intelligence tests.** *Journal of School Psychology*, 1974, Vol 12(2), 150-157.—Considers that competency standards are important to school psychology training. A study conducted with 107 graduate education students is described to demonstrate, in the area of individual intelligence test administration, how competency standards can be implemented. The study set up behavioral objectives, determined what training was required for specified levels of mastery, and showed what specific training procedures contribute to the achievement of competency.—*Journal abstract*.

1239. **Bogdan, Robert; Taylor, Steven; deGrandpre, Bernard & Haynes, Sondra.** **Let them eat programs: Attendants' perspectives and programming on wards in state schools.** *Journal of Health & Social Behavior*, 1974(Jun), Vol 15(2), 142-151.—Describes aspects of

attendants' definitions of supervisors, their jobs, and residents of state schools that relate to the implementation of "innovative" programs designed by supervisory and professional staff to serve the needs of the residents. Data were obtained from participant observation studies of wards in state schools for the mentally retarded. (16 ref)

1240. **Bordin, Edward S.** (U Michigan) **Reflections on preparation for psychological counseling.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses the influence of instrumental knowledge, personal motives and other characteristics, and setting on the counselor's functions. The level of preparation required for psychological counselors is discussed, and issues surrounding learning vs experiencing, diagnosis, and supervision in counselor trainee programs are examined.

1241. **Brodsky, Annette.** (U Alabama) **Status of women in the psychological community in the Southeast: Women as graduate students.** *American Psychologist*, 1974(Jul), Vol 29(7), 523-526.—Results of interviews with female and male psychology graduate students in southeastern institutions reveal little evidence of perceived "soft" sex discrimination in assignments, interpersonal relationships, and encouragement received. The sexes were similar in financial aid received and field of psychology pursued. However, females felt that they were not fully accepted as individuals by the faculty.

1242. **Cardon, Bertell W.** (U Pennsylvania) **Membership characteristics of the Division of School Psychology of the American Psychological Association.** *American Psychologist*, 1974(Aug), Vol 29(8), 632-638.—Provides statistics on the composition and characteristics of the American Psychological Association's Division of School Psychology. Information from membership records of the Division, the *American Psychological Association 1972 Membership Register*, and a questionnaire sent to approximately 150 members reveals that of the Division's total membership of 2,485, 49% have earned the doctorate (58% male and 33% female) and 51% hold the MA or BA degree. Approximately 75% of the members—68.2% male and 84.6% female—are employed principally in nonuniversity settings. Other findings show that 47.8, 48.1, and 4.1% of the female members are Associates, Members, and Fellows, respectively, while 36.3, 57.9, and 5.7% of the male members have the same roles. Although women represented less than 40% of Division membership in June 1973, they held more than half of the seats on the Executive Committee.—*M. Pounsel*.

1243. **Chartoff, Marvin B. & Bardon, Jack I.** (Rutgers State U) **Doctoral school psychology program graduates in the United States: The first seventeen years.** *Journal of School Psychology*, 1974, Vol 12(2), 102-113.—Surveyed graduates of all known doctoral school psychology programs in the US from the inception of school programs in 1953 through 1970 to determine their background, professional development and interests, and their concerns about training. Findings were based on a 78% return rate ( $n = 324$ ). It is concluded that separate doctoral programs in school psychology appear at present to be an efficacious way to ensure orientation,

commitment, and training for the application of psychology to school problems. (22 ref)—*Journal abstract.*

1244. Cody, John J. (Southern Illinois U) **Role playing with stimulated recall.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Describes the use of stimulated recall procedures and role-playing sessions in improving student counseling skills. How these techniques can increase the reality of the training experience, cautions in introducing role-playing procedures to beginning students, and the use of recall procedures for training evaluations are discussed.

1245. Cook, Daniel W.; Kunce, Joseph T. & Sleater, Susan M. (U Missouri, Columbia) **Vicarious behavior induction and training psychiatric aides.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 293-297.—Studied the effectiveness of various techniques in developing desired behaviors in psychiatric aides. 33 psychiatric aide trainees were assigned to 1 of 3 types of training: discussion group, didactic teaching and discussion group, or vicarious induction. Vicarious induction involves determining the specific behaviors and attitudes which are desired, selecting appropriate models to depict these behaviors in videotaped episodes, and having the trainees observe and discuss the meaning of the videotapes. All groups were given written copies of 9 lessons on appropriate and facilitative interpersonal skills (e.g., listening behaviors and giving and receiving help). Training effects were assessed immediately after the sessions and 6 mo after the trainee's actual work on a ward. Ss in the vicarious (modeling) group received the highest ward ratings, followed by the didactic-discussion group, and finally by the discussion-only group. (15 ref)—*L. Gorsey.*

1246. Cottingham, Harold F. (Florida State U) **Using case materials in counselor preparation.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Describes various types of written and taped case materials and presents illustrations of typical case data in each category. The application of case data to 3 aspects of counselor education (didactic, practicum, and experiential) is examined, and some problems associated with the use of case materials in theoretical, ethical, and practical teaching situations are discussed. (35 ref)

1247. de Rosis, Helen A. (Roosevelt Hosp, New York, NY) **Supervision of the first-year psychiatric resident.** *Psychiatric Quarterly*, 1973, Vol 47(4), 592-603.—Presents the 13th and 14th parts of a series of discussions on facets of psychotherapeutic technique for the novice. Part 13 suggests that the elemental essentials in a beginning therapist's relationship with a patient are the words *how, who, what, where, when*, and sometimes *why*. These will convey to the patient an interest in details of his life, help him clarify things he has not understood, provide him with opportunity to talk at length with someone not reluctant or exasperated with him, and enable him to air his feelings without fear of rejection. Part 14 discusses the therapist's feelings for and about the patient—recognizing the patient's suffering and desperate desire for help—and stresses the therapist's need to maintain continuing interest, acceptance, and care.—*B. McLean.*

1248. Evans, Ian M. & Nelson, Rosemary O. (U Hawaii) **A curriculum for the teaching of behavior assessment.** *American Psychologist*, 1974(Aug), Vol 29(8), 598-606.—Describes a curriculum for the teaching of behavior assessment to graduate students of clinical psychology in which an attempt was made to integrate, within the single-S research strategy, both experimental psychopathology and the observational methods employed in behavior modification. Various psychological assessment issues are discussed in the context of the organization of the required readings for the course.—*Author abstract.*

1249. Farwell, Gail F. (U Wisconsin, Madison) **Ethics and the helping professional.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Presents a series of basic questions for the counselor to consider when thinking about his functions and purpose as a helping professional. The code of ethics of the American Personnel and Guidance Association and of the American Psychological Association are appended to the article.

1250. Farwell, Gail F.; Gamsky, Neal R. & Mathieu-Coughlan, Philippa. (U Wisconsin, Madison) **The counselor's handbook.** New York, NY: Intext, 1974. x, 530 p.

1251. Fooks, Gordon M. (Pennsylvania State U) **Dilemmas of black therapists.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Jul), Vol 1(4), 181-191.—Discusses some obstacles that may be encountered by black counselors and therapists in the course of training, client relationships, and practice. In their training, black counselors often receive white middle-class interpretations of research and are denied the opportunity to treat black patients. Training experiences with white patients cannot be automatically applied to the problems of black clients. Special issues involved when a black therapist treats a white client and a black client are identified, including transference, identification, race "consciousness," and guilt feelings. The attitudes of other therapists toward the black therapist are also examined. The necessity of developing new training models and conducting specific studies of the problems of the black therapist is stressed. (23 ref)—*L. Gorsey.*

1252. Gallessich, June. (U Texas, Austin) **Training the school psychologist for consultation.** *Journal of School Psychology*, 1974, Vol 12(2), 138-149.—Suggests and discusses several dimensions—value orientation, target, operational level, method, and consultant role—which are helpful in identifying differences among models of consultation. These dimensions are applied to the evaluation of major models: (a) consultation to transmit information, (b) medical model consultation, (c) mental health consultation, (d) program consultation, (e) process consultation—organizational humanization and renewal, and (f) advocacy consultation—social systems intervention. A school consultation training program is described, and related training issues are raised. (35 ref)—*B. McLean.*

1253. Geller, Jesse D. & Feirstein, Alan R. (Yale U) **Professional training in community mental-health centers.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York,

NY: Intext, 1974. x, 530 p.—Describes the development and characteristics of community mental health centers and the kind of training that they may be able to provide for students in the areas of comprehensive services and community responsiveness. Problems in developing a professional identity and system of values, and the nature of collaborative training are also examined. (35 ref)

1254. Gendlin, Eugene T. (U Chicago) **The role of knowledge in practice.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses possible misuses of knowledge about a client or a counseling process that can affect treatment outcome. 5 major misuses are identified (e.g., the substitution of concepts for experience). 7 criteria for using knowledge properly in the counseling process are discussed, and the importance of understanding the experiential aspects of a problem, rather than its theoretical implications, is emphasized.

1255. Goldstein, Marion Z. (St Francis General Hosp, Day Ctr Services, Pittsburgh, PA) **In-service training offered in a CMH/MRC interview technique seminar with use of videotape.** *Journal of Medical Education*, 1974(Aug), Vol 49(8), 789-791.—Describes a 14-wk videotape seminar series on interview techniques used as inservice training for community mental health/mental retardation center (CMH/MRC) nurses, staff members, and social workers. The seminar included videotapes of 7 psychiatrists and 7 patients representing different aspects of the interviewing process, group discussions of interview styles, and practice interview sessions.

1256. Gray, James J. (American U) **Methods of training psychiatric residents in individual behavior therapy.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 19-25.—Considers that the traditional lecture and supervision method of training psychiatric residents evolved for the teaching of nonbehavioral methods of therapy. 5 relatively underused training techniques (experiential learning, films and tapes, observation of models, microcounseling, and observation by supervisors) are suggested as more appropriate, since they utilize a nonaversive atmosphere, mainly positive control, direct observation, immediate specific feedback, and a gradual shaping of a complex therapeutic repertoire. Basic readings should be programmed while later readings should be problem-centered. (46 ref)—*Journal abstract*.

1257. Gross, Douglas R. (Arizona State U) **The supervisory process: Multiple-impact supervision.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Describes the concept of multiple-impact supervision and its application to counselor training. With this approach, supervisors with different theoretical orientations are paired with students so that the trainees can grasp the full dimensions of the counseling process. The approach also provides individual instruction and can be used to expand the traditional practicum and provide in-depth experiences for counseling students.

1258. Group for the Advancement of Psychiatry, Committee on Psychiatry & Law. (New York, NY) **Misuse of psychiatry in the criminal courts: Competency to stand trial.** *GAP Report*, 1974(Feb), Vol 8(89), 853-919.—Discusses the collaboration of psychiatrists in the system of criminal justice, particularly their neglected role in helping courts decide whether a defendant is competent to stand trial. Conflicting assumptions that cloud the issue of competency to stand trial are discussed, and historical standards of competency are reviewed. New procedures are recommended to correct the abuses of current procedures. (51 ref)

1259. Gust, Tim. (U Hawaii) **Contributions and limitations for professional counselor preparation: University counseling centers.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Describes the potential of university counseling centers as training facilities for professional counselors. The historical background of counseling internships is reviewed, and training standards, counselor-trainee relationships, staffing patterns, and evaluation procedures involved in a model counseling center training program are discussed. (26 ref)

1260. Gysbers, Norman C. & Ronnestad, Michael H. (U Missouri) **Practicum supervision: Learning theory.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Examines the implications for counselor practicum supervision of the following learning theory concepts: performance objectives, modeling, and types of reinforcement. Specific recommendations to facilitate counselor-trainee learning are made. (19 ref)

1261. Hardy, Kenneth R. (Brigham Young U) **Social origins of American scientists and scholars.** *Science*, 1974(Aug), Vol 185(4150), 497-506.—Developed a productivity index to determine the relative productivity of schools, states, and regions as the origins of scientists and scholars over a 40-yr period. Data suggest that variations in the production of scholarly and scientific doctorates in the US are associated with religious-ethnic group membership and certain beliefs and cultural values. (25 ref)

1262. Harshbarger, Dwight & Maley, Roger F. (West Virginia U) **Getting off the horns of the dilemma: Behaviorally based treatment systems.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Considers that concepts of deviance and therapeutic strategies aimed at treating deviance in mental health systems are strongly based in community values, and that therapists, as members of communities, act as agents of social control when they engage in what they perceive as helpful therapeutic endeavors. The issue of whether mental health professionals are actually doing harm to their patients and the fact that psychodynamic therapies themselves are value-oriented are discussed, and suggestions for behaviorally based treatments which would resolve this dilemma are presented. (25 ref)

1263. Hosford, Ray E. (U California, Santa Barbara) **Behaviorism is humanism.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's*

*handbook*. New York, NY: Intext, 1974. x, 530 p.  
—Discusses the role of a behavioral counselor in decision making, changing behavior, and preventing problems. The need to base counseling on scientific rather than philosophical foundations is emphasized, and the humanistic principles that are inherent in any aspect of changing behavior or solving problems are considered. (24 ref)

1264. Hunter, Carol P. & Lambert, Nadine M. (California State U, Long Beach) **Needs assessment activities in school psychology program development.** *Journal of School Psychology*, 1974, Vol 12(2), 130-137.  
—Presents needs assessment activities as a basis for gathering information essential to program development, revision, and evaluation. Needs assessment activities which are discussed include surveys of trends advocated by national authorities and consumers and identification of needs of trainees, graduates, and local school systems. These data form the basis for developing program objectives in a sequentially ordered multilevel program. (37 ref)—*Journal abstract*.

1265. Joesting, Joan. (Livingstone Coll) **Status of women in the psychological community in the South-east: Women in academe.** *American Psychologist*, 1974(Jul), Vol 29(7), 520-523.—Results of a survey of psychology departments in southeastern institutions reveal that women are underrepresented on the faculty and in doctoral programs. Women full professors receive substantially lower salaries than men, while the reverse is true for associate professors. Salaries are higher for both sexes in larger institutions.

1266. Johnson, Warner et al. (U Southern California, Medical School) **Applying principles of instructional design to a medical school course in psychiatry.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 822-824.—Describes a successful course in which a description of the program design and instructional techniques were presented to 2nd-yr medical students, emphasizing in a specific way the development and implementation of learning objectives. Results show that these instructional methods led both to increased perceived learning and to greater actual learning.

1267. Karasu, Toksoz B.; Plutchik, Robert; Herschenfeld, Philip & Siegel, Barbara. (Albert Einstein Coll of Medicine, Yeshiva U) **The effect of a psychiatric residency program on admission and discharge rates and patient disposition.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 918-921.—Examined the effect of a residency training program on the services delivered to patients on 2 psychiatric wards of a general hospital. Data obtained before and after the introduction of the program indicate that screening procedures and the relationship between ward and intake services improved, uninteresting cases were not "dumped," and treatment was focused on the more seriously ill patients.

1268. Karasu, Toksoz B.; Stein, Stefan P. & Charles, Edward S. (Albert Einstein Coll of Medicine, Yeshiva U) **A preliminary study of the elimination of the internship: A comparative study of performance of internship- and noninternship-trained residents in a psychiatric inpatient setting.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 269-272.—In 1970, the American Board of Psychiatry and Neurology eliminat-

ed the internship as a requirement for certification in psychiatry. This study compared the work on a psychiatric inpatient service of 14 internship-trained 1st yr residents with that of a matched group of 14 residents who entered the same program without an internship. A chart review comparison disclosed differences in patient care practices in the areas of length of stay, writing of progress notes, and use of the laboratory and medical consultants. Staff ratings of the residents differed significantly in 4 of 5 measured categories (maturity, ability to relate to staff, ability to handle medical problems, and ability to handle psychiatric patients in general).—*Journal abstract*.

1269. Kehas, Chris D. (Manchester Public Schools, NH) **Counseling.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses the present status of training programs for school counselors. A proposed redirection of the functioning of counseling in schools is offered, research on training practices is examined, and the benefits of practicum experience are described. (16 ref)

1270. Kendell, R. E.; Pichot, Pierre & Von Cranach, M. (Royal Edinburgh Hosp, Scotland) **Diagnostic criteria of English, French, and German psychiatrists.** *Psychological Medicine*, 1974(May), Vol 4(2), 187-195.  
—Videotape recordings of brief diagnostic interviews with 27 patients newly admitted to a psychiatric hospital in London were shown to groups of English-speaking psychiatrists in London, Paris, and Munich. Comparison of the diagnoses made by the 3 audiences suggests that English, French, and German psychiatrists have similar concepts of schizophrenia, neurotic illness, personality disorder, and alcoholism, but differ markedly in their concept of affective illness, particularly manic-depressive illness. English psychiatrists have much broader concepts of both neurotic and psychotic depression and of mania than the French, with German psychiatrists in an intermediate position. Important differences in the use of other technical terms like agitation, perplexity, and thought disorder also emerged. The ratings of the English and German audiences were closer to one another than either was to the French.—*Journal abstract*.

1271. King, Paul T. & Wollersheim, Janet P. (U Missouri) **Training for the applied psychologist in a university psychological service center.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Presents recommendations regarding the education and training of applied psychologists. It is suggested that (a) the scientist-professional educational model could be better utilized, (b) students should receive broader training which includes preparation for behavioral and professional role expectations, and (c) teachers and supervisors should continue to see clients.

1272. Kirk, Barbara A. & Chin, Arnold H. (U California, Berkeley) **Utilization of university counseling centers for counselor preparation.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses selection, staffing, and treatment issues involved in using university counseling centers as training sites for counselors. Problems in maintaining the

service role of the center while providing comprehensive training are examined, and specific steps in facilitating trainee performance in interviewing, gathering occupational and educational information, and prescribing treatment are identified.

1273. Klein, Donald C. (NTL Inst for Applied Behavioral Sciences, Ctr for Macrosystem Change, Washington, DC) **Community change agents.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Discusses issues involved in the selection, training, and functions of mental health workers in community agencies. The heterogeneous backgrounds and skills of new workers and the resultant problems of classification, status, and utilization; staff roles in internal and external agencies (e.g., outreach programs); and the necessary development of linkage and problem-solving systems for training are analyzed. A classification scheme for change functions and settings is proposed. (27 ref)

1274. Krawiec, T. S. (Ed.). (Skidmore Coll) **The psychologists: II.** New York, NY: Oxford University Press, 1974. viii, 532 p. \$10.95 (cloth), \$6.95 (paper).—11 psychologists from various teaching and research areas present a technical account of their work and of their intellectual life-styles in essays that reflect their personalities, outlooks, and ideals.

1275. Kurpius, DeWayne J. (Indiana U) **Objectives, theories, and methodologies for video application in counseling and counselor training.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Identifies factors which contribute to the generally positive results of the use of videotape feedback in teaching, including the stimulus impact created by viewing a sample of one's own behavior and the nature of the playback processes and procedures which are followed. Technical aspects of recording individual and group sessions in laboratory settings, the role of nonverbal behavior and body language, simulation as a training aid, the use of recorded monologues in training, and computer-assisted videotaping are described. (31 ref)

1276. Kurz, Ronald B. (American Psychological Assn, Educational Affairs Office, Washington, DC) **Emerging issues in accreditation of training programs in school psychology.** *Journal of School Psychology*, 1974, Vol 12(2), 114-120.—Notes that accreditation is an important concept in school psychology training and is becoming a source of much controversy. There are definite reasons for accreditation of school psychology programs by the American Psychological Association, but the jurisdictional conflict has not been fully resolved. The matter of nondoctoral program accreditation and the role of social issues in accreditation are discussed. —*Journal abstract*.

1277. Lawlis, G. Frank & Barr, Alwyn. (Texas Tech U) **Some considerations in the education of minority rehabilitation counselors: A southwestern university.** *Rehabilitation Literature*, 1974 (Apr), Vol 35(4), 110-111.—Focuses on 3 aspects of graduate education in psychology for minority students. (a) Recruitment—the idea of minority students eager for admission is a

misconception; to recruit good students requires skillful and understanding recruitment techniques. (b) Teaching—substandard or culturally unique language need not be a deterrent; what is needed is willingness on the part of the faculty to accept unusual means of expression. (c) Placement—students may not want to return to their culture or to the ghetto; upon graduation, jobs should be sought that reflect individual interests rather than previous cultural ties.—S. L. Warren.

1278. Lederman, Selwyn. (Bronx State Hosp, NY) **Some ideas and gains in training paraprofessionals as group therapists.** *Journal of the Bronx State Hospital*, 1974 (Spr), Vol 2(2), 86-95.—Describes a theme-centered method which, by encouraging personal statements, using concrete examples, and emphasizing individual responsibility and group action, facilitates learning by both professionals and paraprofessionals. The types of supportive methods used to create this productive training situation are discussed.

1279. Lee, James L. (U Wisconsin, Madison) **Group counseling: From research to training and practice.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Reviews research on the efficacy of group counseling. A series of generalizations based on patterns in the literature are presented to specify the various settings and tasks in which group counseling is effective. An experiential model of training in group counseling is described, the roles of the counselor as both a group consultant and a psychological educator are discussed, and the need for further study on leadership and other group processes is noted. (23 ref)

1280. Levine, David. (U Nebraska) **The dangers of social action.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Cautions against the involvement of mental health professionals in planned social and political activities; this may lead to the establishment of a mental health power elite which is not accountable to the general public and not aware of the risks in community psychology. It is recommended that community psychologists receive broad, interdisciplinary training in history, sociology, law, and economics. (19 ref)

1281. Lipsey, Mark W. (Claremont Graduate School) **Research and relevance: A survey of graduate students and faculty in psychology.** *American Psychologist*, 1974 (Jul), Vol 29(7), 541-553.—Survey results indicate a strong trend toward increased social concern in psychology faculty and students and a weaker trend toward decreased reliance on experimental methods. Six identified 3 issues of major importance for psychology—relevance, research and theory, and therapy and humanism.

1282. Liston, Edward H. (U California, Neuropsychiatric Inst, Los Angeles) **Psychiatric aspects of life-threatening illness: A course for medical students.** *International Journal of Psychiatry in Medicine*, 1974 (Win), Vol 5(1), 51-56.—Describes a course on the psychiatric aspects of life-threatening illness. Techniques include seminar discussions and patient interviews. Few such courses are offered in medical curricula, but the

excellent student response suggests that medical education should be required to include this area of study.

1283. **Livers, David L.** (Illinois State U) **Theoretical, professional, and ethical issues in counselor education.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Presents a discussion of (a) theoretical issues concerning the enrichment of counselor training and the selection of counselor trainees; (b) professional issues dealing with the role, function, and evaluation of the counselor; and (c) the ethical issues of the counselor's responsibility and value system. (36 ref)

1284. **Lundberg, Craig C.** (Oregon State U, School of Business & Technology) **Toward explicating effective interventions: An emphasis on reducing incongruities.** *Interpersonal Development*, 1973-1974, Vol 4(1), 42-50.—Considers that, beyond the group context and minimal conditions of trust and openness, self-awareness, and acceptance, the trainer's behavior is the most crucial factor in a group member's learning. The conscious and deliberate efforts of the trainer are explicated, including interventions which promote conditions for learning (i.e., building trust, offering feedback, and disclosing self) and those interventions less well recognized, which directly facilitate learning (i.e., the focusing of incongruities and indicating ways of reducing them).—*Journal abstract.*

1285. **Malcolm, David D.** (California State U, San Diego) **A two-year program of counselor education.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses the unique contributions of the school counselor (e.g., in promoting individuality) and the professional training required to meet counselor role expectations. Distinctions are made between elementary- and secondary-school counseling, and a 2-yr program for training secondary-school counselors is outlined.

1286. **McMurray, J. M.** (U Western Ontario, Althouse Coll, London, Canada) **Role perceptions of school psychologists: An empirical inquiry.** *Ontario Psychologist*, 1974(Apr), Vol 6(1), 10-15.—Analyzed responses by 144 Ontario school psychologists to the Psychological Services Inventory (PSI). Information requested on the PSI was of 3 types: (a) basic data regarding age, etc; (b) an indication of the 5 duties occupying the most and the least of the respondent's professional time, and his ideal 5 most and least; and (c) referral procedures and time spent on report writing, testing, and other common duties. Results indicated that the group's modal age was under 30 yrs, both sexes were equally represented, and most were nondoctorates. Ss' real and ideal duties differed considerably. Most spend a great deal of time in individual assessment, used written referrals, and gave written reports. The medical model seems entrenched.—*A. Krichev.*

1287. **Mearig, Judith S.** (St Lawrence U) **On becoming a child advocate in school psychology.** *Journal of School Psychology*, 1974, Vol 12(2), 121-129.—Considers that child advocacy is becoming an important concept among services for children. There are definite societal reasons for the evolution of formal advocacy mechanisms, not the least of which is the functioning of professionals. School psychology provides

an opportunity for many child-advocacy concepts to be implemented. However, the individual psychologists must have a personal commitment to see that children's needs are met. It is argued that child advocacy can be built into the school psychology training program in both philosophy and practice.—*Journal abstract.*

1288. **Merenda, Peter F.** (U Rhode Island) **Current status of graduate education in psychology.** *American Psychologist*, 1974(Aug), Vol 29(8), 627-631.—Surveyed chairmen of psychology departments in 32 state universities and 9 private universities offering doctoral-level programs in basic and applied psychology, to determine the extent to which education and training is available for graduate students in the applied areas of psychology, specifically clinical psychology. Results indicate the following: (a) For all practical purposes, the PhD degree is the only doctoral degree being awarded in both basic and applied psychology. (b) The majority of the departments offering advanced graduate work in psychology insist on a variable core of required courses. (c) The comprehensive examinations taken by students in these programs are largely broad and integrative and are more likely to be administered by either a departmental examining committee or the student's own program committee. (d) For those departments in which a core of courses is not required of all doctoral students, there are substitute requirements, including demonstration of competencies and knowledge in content areas through examinations, or in the successful completion of a minor academic area.—*M. Pounsel.*

1289. **Moses, Mabel S.** (Cook County Hosp, Chicago, IL) **Role of a medical social worker in the rehabilitation of the physically handicapped person.** *Indian Journal of Social Work*, 1974(Jan), Vol 34(4), 295-306.—Defines the components of rehabilitation, which involves restoration of physical, mental, social, vocational, and economic capacity. To this has been added the concept of creativity. The functions of the medical social worker are discussed with respect to casework services, work with the family, environmental manipulations, psychological and vocational services, and liaison and public relations.—*I. W. Kidorf.*

1290. **Mowlesian, Richard.** (U Texas, Austin) **Projected planning for innovative techniques in the counselor-preparation process.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Based on the belief that counselor education should be designed to develop more effective human interaction agents and that the goals of counselor preparation are similar to those of counseling itself, several variations in the supervision process are described. The view that counselor education is a never-ending process is stressed.

1291. **Naar, Ray.** (St Francis General Hosp, Pittsburgh, PA) **Personality changes and innovations in teaching counseling skills to undergraduates.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 52-57.—Describes a training program to increase the qualities of nonpossessive warmth, genuineness, and accurate empathy. A course was offered to senior psychology majors who were interested in a mental health career. Methods included didactic sessions, mock therapy sessions, feedback from students playing the role

of client, review of taped sessions, and exercises borrowed from psychodrama and encounter groups. The Personality Orientation Inventory, designed to measure self-actualization, was given to the training group before and after the course as well as to a control group of senior students in an abnormal psychology class. More changes in the direction of health and self-actualization were observed in the training group.—C. P. McCreary.

1292. Nazzaro, J. Russell. (American Psychological Assn., Educational Affairs Office, Washington, D.C.) **The two-year college instructor: A profile.** *American Psychologist*, 1974(Jul), Vol. 29(7), 554-557.—Surveyed psychology teachers in community or junior colleges concerning their educational training and their interest in activities proposed by the American Psychological Association (APA) for 2-yr college teachers. Ss were most interested in activities that would improve communication (e.g., APA-sponsored regional meetings and the development of a periodical).

1293. Nelson, Ronald H. (Herman M. Adler Ctr, Champaign, IL) **The crisis call center and its volunteers: A comparison of views with mental health professionals.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 237-241.—Studied the perceptions of a crisis call center (CCC) within the agency network of a community. Distance scores between concepts on a semantic differential rating scale were used to determine how close mental health professionals and 40 CCC volunteers perceived the CCC to be to the other mental health agencies in the community. The type of mental-health-related occupations with which the volunteers identified were also examined. Volunteers tended to identify with all the occupational concepts that were used (psychologist, psychiatrist, social worker, minister, and policeman), but to varying degrees. Mental health professionals included the CCC in their cluster of helping agencies. Implications of the findings for increasing understanding of the role of volunteers in community crisis efforts and the interrelationships among service agencies are discussed.—*Journal summary*.

1294. Patterson, Cecil H. (U Illinois) **Distinctions and commonalities between counseling and psychotherapy.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Presents definitions of counseling and psychotherapy. It is suggested that significant differences between the 2 disciplines have not been established. Their basic similarities are described, and implications for training counselors and psychotherapists are discussed. (31 ref)

1295. Pendergrass, Virginia E. **Women as clinicians in private practice.** *American Psychologist*, 1974(Jul), Vol. 29(7), 533-540.—Based on questionnaire data, personal characteristics, income level, and clientele of private clinicians in southeastern cities are described, with emphasis on sex differences. There were fewer females in private practice, and no female therapist reported adult males as the primary clientele. Females experienced less full-time work and economic growth than males.

1296. Piacente, Beth S. (U South Florida) **Status of women in the psychological community in the Southeast: Women as experimenters.** *American Psychologist*, 1974(Jul), Vol 29(7), 526-529.—Studied the evaluative

perceptions of undergraduate psychology majors regarding the performance of videotaped male and female Es. When Es were described as competent, Ss judged both sexes to be equally competent. When Es were described as incompetent, Ss (particularly males) perceived female Es as much less competent than male Es. Competent female Es were also perceived as less feminine.

1297. Prothero, Jon C. & Ehlers, Walter H. (Florida State U) **Social work students' attitude and knowledge changes following study of programmed materials.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 83-86.—Pre- and posttest data concerning the knowledge and attitudes of 46 social-work students indicate significant increases in performance (knowledge about retardation) but no differences in attitudes toward retarded persons. It is concluded that to change student attitudes something other than an increase in knowledge is necessary. (15 ref)

1298. Riccio, Anthony C. (Ohio State U) **The counselor as a social reconstructionist.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Suggests that counselors should, in addition to treating the problems of the individual, consider their clients as members of a complex societal situation with a demanding set of circumstances. Assumptions of the view of the counselor as an agent of social change and evidence of the effectiveness of this counselor role are examined.

1299. Roeber, Edward C. **Practicum supervision: Trait theory.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses the supervisor's problem of evaluating counselor-trainees' readiness for and progress in practicum experience. The basic principles of trait theory are described, and hypotheses are presented concerning the traits of counselor trainees during practicum experience. (22 ref)

1300. Smith, Kenneth E. & DiBacco, John. (George Peabody Coll for Teachers) **The multidisciplinary training team: Issues and problems.** *Journal of School Psychology*, 1974, Vol 12(2), 158-167.—Notes that the need for interdisciplinary training and collaboration is well documented. Some of the issues and recurring problems in operating multidisciplinary training teams in school settings are recounted, and principles and procedures for dealing with such matters as initial attachment of the team to a school, problems within the training team itself, and modification of roles are discussed.—*Journal abstract*.

1301. Sophie, Joan. (U. South Florida) **Status of women in the psychological community in the Southeast: Women as scholars.** *American Psychologist*, 1974(Jul), Vol. 29(7), 529-532.—Administered a questionnaire to members of the Southeastern Psychological Association to examine sex and other variables as predictors of rate of publication in scientific and professional journals. While men published more than women, this difference was largely accounted for by differences in education and employment; women who rated as high as males on these variables published the same amount as males.

1302. Thrush, Randolph S. (U Wisconsin, Madison) **Literature as a sociocultural encounter.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses the importance of books in understanding human behavior, specifically the contribution that contemporary novels may make to counselor education. An annotated bibliography of 113 fiction and nonfiction works that may be helpful in counselor training is included.

1303. Tiedeman, David V. (Northern Illinois U) **What the counselor needs to know, do and be.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses the knowledge, professionalism, and guidance expertise required of the counselor. The necessity of developing a theory of guidance which utilizes the principles of science, applied science, and guidance is discussed, and a graduate program in counselor education is described.

1304. Tucker, Samuel J. (U Florida) **Action counseling: An accountability procedure for counseling the oppressed.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Oct), Vol 2(1), 35-41.—Describes an "action counseling" model to help eliminate biases of white counselors toward black clients. The approach is aimed at specifying the goals and commitments of the counselor by assessing specific levels of trust, needs, long- and short-term goals, and therapeutic strategies. This action approach was evaluated with 40 black disadvantaged undergraduates who received either action or traditional counseling. Ss completed a pre- and postcounseling inventory about specific problems and what they felt were adequate solutions to these problems, and also a 5-point rating scale of counselor effectiveness. Results indicate that the action model counselees differed significantly on pre- and posttest evaluation regarding the degree of satisfactory solutions to identified problems, and that action counselors were perceived as more helpful than traditional counselors.—*L. Gorsev.*

1305. Ullmann, Leonard P. & Kemp, Carolyn H. (U Hawaii) **Home intervention training programs.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Proposes a behavioral model of mental health intervention which emphasizes the fact that under many conditions nonprofessional intervenors are more effective than traditional therapists in producing significant changes. Contrasts and implications of this behavioral model and the traditional medical model are discussed, and the process of outcome evaluation and a home intervention seminar series for parents are described. (5 p ref)

1306. Walz, Garry R.; Roeber, Edward C.; Gysbers, Norman C. & Ronnestad, Michael H. (U Michigan) **Practicum supervision: Integrated theory of supervision.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Presents 13 propositions which integrate the authors' previous applications of learning theory, trait theory, and self-theory to practicum supervision of counselor trainees. The propositions deal

with the counselor trainee's self-development and learning experiences and the supervisor-trainee relationship.

1307. Walz, Gary R. (U Michigan) **Practicum supervision: Self-theory.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Reviews the principles of self-theory—the concept that the major determinants of behavior are the individual's perception of his self and environment. It is suggested that the use of self-theory by supervisors of counselor trainees would promote a better supervisor-trainee relationship and understanding of the trainee's self-perceptions and behavior.

1308. Werner, Arnold & Schneider, John M. (Michigan State U, Health Ctr) **Teaching medical students interactional skills: A research-based course in the doctor-patient relationship.** *New England Journal of Medicine*, 1974(May), Vol 290(22), 1232-1237.—Describes and evaluates the design, implementation, and results of a course conducted with 87 1st-yr medical students. Goals included identification of selected doctor-patient interactions, recognition and description of feelings and reactions to the interview, and learning new ways of responding in the interview setting. No prior knowledge of clinical medicine was required of the students, but they gained actual interview experience. By pre- and postcourse testing and by evaluating videotaped interviews, behavioral changes in student performance as a function of the course were examined. Results indicate that students became more aware of their responses to patients and of their impact on the doctor-patient relationship. (16 ref)—*Journal abstract.*

1309. Whitaker, Carl A. & Abrams, Gene M. (U Wisconsin, Madison) **New approaches to residency training in psychiatry.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Considers that the new approach to psychiatric residency training attempts to transcend provincialism and the use of single techniques by emphasizing a radical commitment to eclectic and existential values. Implications for supervision, case presentations, and team membership are discussed.

1310. Wolleat, Patricia L. (U Wisconsin, Madison) **What the counselor needs to know: Dimensions of counselor behavior.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Describes 4 fundamental functions of the counselor in assisting the development of the client. The counselor must (a) help the client establish desirable and feasible goals for behavior change; (b) set up a supportive environment; (c) design and implement strategies to accomplish goals; and (d) evaluate goals, processes, and outcomes.

1311. Zimbardo, Philip G. (Stanford U) **On the ethics of intervention in human psychological research: With special reference to the Stanford prison experiment.** *Cognition*, 1973, Vol 2(2), 243-256.—Presents a synopsis of the Stanford prison experiment, summarizes critical arguments against the experiment, evaluates unethical aspects of the study, and considers information relative to decisions of ethicality. In answer to criticisms leveled by H. B. Savin (see PA, Vol 53:Issue 1) the

absolute and relative ethical principles guiding research and human experimentation are considered. While acknowledging that the Ss in the prison experiment did suffer pain and humiliation, data are presented indicating that the Ss learned a number of things about themselves and that there were no persisting negative reactions. The indirect impact of the study through media coverage resulted in interest by legislative bodies and the public in discussions and proposals to modify or drastically change the prison system and other "prison-like" institutions (e.g., psychiatric hospitals and ghettos).—S. Knapp.

1312. **Zusman, Jack & Carnahan, William A.** (State U New York, Buffalo) **Psychiatry and the law: Changing the system through changing the training.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 915-918.—Proposes a new training approach involving both psychiatry and the law that would emphasize interactional problems of both professions and practical methods of bringing about change, thus improving the present system. The approach involves a 1-yr graduate program following psychiatric residency, the use of training change agents for cross-disciplinary performance, field placements, and attitudinal and problem-solving approaches to training. (15 ref)

## PHYSICAL AND PSYCHOLOGICAL DISORDERS

1313. ———. **Bibliography of developmental medicine and child neurology: Selected books and articles received in 1973.** *Developmental Medicine & Child Neurology*, 1974, Vol 16(2, Suppl 31), 176 p.—Lists, without annotation, 259 books and 2,133 articles received in 1973, on genetics, cytogenetics, embryology and teratology, developmental abnormalities, neonatal studies, cerebral palsy, epilepsy, Down's syndrome, neurological disorders, disorders of communication, neurophysiology and neuroanatomy, developmental studies, orthopedics of malformations, metabolic disorders, muscular disorders, mental handicap, and psychology and psychiatry. A detailed subject index is included.

1314. **Blankenship, Dumont G.** **Social desirability and delinquent behavior in adolescent females.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 335-336.—Administered the Marlowe-Crowne Social Desirability Scale to 28 sexually delinquent, 23 nonsexually delinquent, and 34 normal females (median age, 15.7 yrs). Analysis of variance shows no significant differences among the groups and suggests that delinquents have the same need as normals for social approval but use only behaviors that are reinforced in their value system to satisfy this need.

1315. **Boll, Thomas J.** (U Virginia, Medical School, Div of Child & Adolescent Psychiatry) **Psychological differentiation of patients with schizophrenia versus lateralized cerebrovascular, neoplastic, or traumatic brain damage.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 456-458.—Results of this study indicate that 80 patients with significant neurological disorders (currently producing signs and symptoms that require evaluation, i.e., cerebrovascular and neoplastic

disease) were significantly more impaired on Parts A and B of the Trail Making Test than were 20 schizophrenics. They were also more impaired than 40 brain-damaged patients in whom the cerebral impairment did not represent a condition in current need of medical treatment.—*Journal abstract*.

1316. **Butters, Nelson & Cermak, Laird S.** (VA Hosp, Psychology Service, Boston, MA) **Some comments on Warrington and Baddeley's report of normal short-term memory in amnesic patients.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 283-285.—Contrasts A. D. Baddeley and E. K. Warrington's finding (see PA, Vol 44:13802) that amnesic patients have normal short-term memory (STM) with the present authors' previous finding of consistent and severe STM impairments in alcoholic Korsakoff Ss. Warrington's patient selection and test procedures are criticized.

1317. **Fuller, Renee N. & Shuman, Joyce B.** (Rosewood State Hosp, Owings Mills, MD) **Genetic divergence in relatives of PKU's: Low IQ correlation among normal siblings.** *Developmental Psychobiology*, 1974(Jul), Vol 7(4), 323-330.—The Stanford-Binet IQ frequency distribution of unaffected siblings of phenylketonuria (PKU) patients differed significantly from the normal population. The excessive number of superior IQs apparently was not a function of superior families. Intersibling correlations were low. A theory is presented on compensatory genetic mechanisms in genetic-recessive diseases. (52 ref)

1318. **Jones, Reginald L.** (U California, Coll of Education, Riverside) **Delivery of special services to young black children.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Jan), Vol 1(2), 61-68.—Argues that in planning special services for retarded, disadvantaged, or deprived black children, little attention has been given to the effects of these labels on the self-concepts and expectations of the children, and that many positive aspects of young black children's cognitive, affective, and life circumstances have not been fully recognized. Data on these issues are presented and the need to adjust the current deficiency-oriented view of black children is emphasized. (19 ref)—L. Gorsey.

1319. **Stierlin, Helm.** (Washington Psychoanalytic Inst, DC) **Separating parents and adolescents: A perspective on running away, schizophrenia, and waywardness.** New York, NY: Quadrangle/New York Times Book, 1974. xiv, 204 p. \$8.95.—Proposes a conceptual framework of the separation process in adolescence, based on the idea of transactional behavior modes which precipitate different forms of running and not running away. This conceptual model is applied to the problems of schizophrenia and delinquency, and the concepts of "mutual liberation" and the "loving fight" are related to the theme of psychological exploitation. (5% p ref)

## Mental Disorders

1320. **Ablon, Steven L.; Carlson, Gabrielle A. & Goodwin, Frederick K.** (McLean Hosp, Children's Ctr, Belmont, MA) **Ego defense patterns in manic-depressive illness.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 803-807.—Made a longitudinal study of 36 manic-depressive inpatients using the Ego Profile Scale

completed independently by 8 psychiatrists. Hypochondriacal and somatization defense patterns were more prominent in unipolar patients at times of stress, whereas in bipolar patients an increase in these defenses often signaled an imminent change in affective state—especially the switch out of mania. Increased tolerance of anxiety appeared to correlate with better prognosis.—*Journal abstract.*

1321. **Adler, Gerald.** (New England Medical Ctr Hosp, Boston, MA) **Current concepts: Acute psychosis.** *New England Journal of Medicine*, 1974(Jul), Vol 291(2), 81-83.—Describes the characteristics and possible precipitating stresses of acute psychotic episodes, and presents suggestions for the nonpsychiatric physician who must manage or evaluate these cases. Experiences that may determine the extent of psychotic reactions (e.g., loss or ambition) and possible central nervous system involvement are discussed. Direct, but tactful, questioning is considered to be the best method of both protecting the patient and determining the cause of the reaction. The patient's ability to form a relation or an alliance with the physician can play an important part in treatment planning, in addition to the availability and reliability of family and friends. Physician familiarity with antipsychotic drugs, temporary commitment laws, and family dynamics is recommended.—*L. Gorsey.*

1322. **Aleksandrowicz, Dov R.** (C. F. Menninger Memorial Hosp, Topeka, KS) **A familial psychosis.** *Bulletin of the Menninger Clinic*, 1974(May), Vol 38(3), 263-267.—Presents a case study of an unusual distribution of a schizophrenic psychosis where all the male siblings in a family were diagnosed as schizophrenic. In addition to other explanations, a sex-linked genetic factor is suggested.

1323. **Allen, David W.** (U California, San Francisco) **The fear of looking—or Scopophilic-exhibitionistic conflicts.** Charlottesville, VA: University Press of Virginia, 1974. ix, 134 p. \$7.95.—Describes the historical background of scopophilia and exhibitionism in analysis, including a study of the relevant personal characteristics of Freud. Clinical data from 13 case histories exemplify the author's principal analytic formulations about and techniques of treating the 2 disorders. (4 p ref)

1324. **Amanat, Ebrahim.** (St Louis State Hosp, MO) **Contents of day and night dreams of emotionally disturbed adolescents.** *Child Psychiatry & Human Development*, 1974(Spr), Vol 4(3), 157-167.—Applied content analysis to reports of "night," "day," and "repetitive" day dreams of 3 groups of adolescents. Ss consisted of inpatients, outpatients, and matched controls, with 10 males and 10 females in each group. The analysis was performed by 2 raters using a combination of rating scales. Differences were found in contents of day and night dreams in the patient and control groups. Schizophrenic patients showed striking differences in dream reporting and contents compared with other clinical groups. Positive correlations between themes of "repetitive day dreams" and "night dreams" were greater in the inpatient group. (26 ref)—*E. S. Goodman.*

1325. **Asch, Stuart S. & Rubin, Lowell J.** (Mt Sinai School of Medicine, City U New York) **Postpartum reactions: Some unrecognized variations.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 870-874.

—Describes 4 cases of postpartum syndromes that are not often recognized, including infanticide and child battering, the grandmother reaction, and adoptive mother reaction, and the father reaction. These reactions derive from experiences involving the person's mental representations of pregnancy, parturition, and motherhood and are not confined to the biological mother. The phenomenon of successive generations of postpartum reactions in women is described and explained as being grandmother-oriented. Awareness of this sequence should aid in the anticipation of postpartum psychopathology. (21 ref)—*Journal abstract.*

1326. **Beck, Aaron T.; Rial, William Y. & Rickels, Karl.** (Philadelphia General Hosp, PA) **Short form of Depression Inventory: Cross-validation.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1184-1186.—Correlations between scores on the short form of Beck's Depression Inventory and clinicians' ratings ranged from .55 for hospitalized depressed patients to .67 for general medical outpatients. The correlation between scores on the short and long forms ranged from .89 to .97, indicating that the short form is a satisfactory substitute for the long form.

1327. **Beiser, M.; Burr, W. A.; Collomb, H. & Ravel, J.-L.** (Harvard U, School of Public Health, Boston) **Pobough Lang in Senegal.** *Social Psychiatry*, 1974(Jul), Vol 9(3), 123-129.—Examined the cultural context and pertinent biological, ethnographic, and historical literature on geophagia in order to study a West African folk illness, Pobough Lang, which is characterized by compulsive geophagia, pallor, weakness, edema, depression, anxiety, and social isolation. Some features of the disease are apparently related to a lack of iron and other nutritional deficiencies. Other features are related to the ambiguous cultural definition of, and negative response to, the manifest behavior. Determinants of the cultural response are examined, and other manifestations of geophagia are described. Implications for psychiatric definition, interpretation, and research are discussed, and it is suggested that the failure to disentangle the elements of complex processes of behavior, definition as disorder, and emotional reaction has led to great confusion, and that some of the controversy between geneticists, dynamic psychiatrists, and labeling theorists may be due to a failure to specify which level of the phenomenon is being discussed.—*Journal abstract.*

1328. **Berman, Emanuel.** (Bronx State Hosp, High-bridge Unit, NY) **Multiple personality: Theoretical approaches.** *Journal of the Bronx State Hospital*, 1974(Spr), Vol 2(2), 99-107.—Surveys attempts to explain multiple personality and discusses their current status. Little support has been found in recent years for supernatural and physiological explanations. A central role is played by theories of multiple personality as a bona fide phenomenon of psychogenic nature, and most of these emphasize unconscious sources of the splitting and the impact of childhood traumata. The psychoanalytic emphasis on Oedipal dynamics has been extended to pre-Oedipal identifications and to the role of internalized objects. It is suggested that W. R. Fairbairn's object relations theory (1952) provides the best available theoretical framework for the study of multiple personality, and that it could be supplemented by role theory and

other sociological and cultural perspectives. (33 ref)  
—*Journal abstract.*

1329. Beumont, P. J.; Friesen, H. G.; Gelder, M. G. & Kolakowska, T. (Groote Schuur Hosp, Cape Town, South Africa) **Plasma prolactin and luteinizing hormone levels in anorexia nervosa.** *Psychological Medicine*, 1974(May), Vol 4(2), 219-221.—Studied 5 emaciated women suffering from anorexia nervosa. Mean plasma prolactin levels, as measured by radioimmunoassay, were within the normal range, while mean plasma levels of luteinizing hormone were depressed. This association suggests that basal levels of circulating prolactin are not affected by the hypothalamic disorder found in patients with anorexia nervosa. (18 ref)—*Journal abstract.*

1330. Biersner, Robert J. & Ryman, D. H. (US Navy Medical Neuropsychiatry Research Unit, San Diego, CA) **Psychiatric incidence among military divers.** *Military Medicine*, 1974(Aug), Vol 139(8), 633-635.—Reports that the psychiatric incidence rate among those holding US Navy diving classifications was over twice that of a nondiving control psychiatric group. The proportion of psychosis, neurosis, and character and behavior disorders among 83 psychiatric divers was similar to that of 381 psychiatric controls, but significantly more divers were admitted for situational maladjustment. In addition, significantly more of the psychiatric divers, especially those diagnosed as having character and behavior disorders, were returned to duty for at least 6 mo than the psychiatric controls. Psychiatric divers were significantly lower than the over 4,000 normal divers on intelligence (measured by the general Classification Test) and measures of mechanical and arithmetic aptitudes, and took longer to make their present rate. This indicates that tests of aptitude and intelligence may be useful in screening for potential psychiatric cases prior to training and classification.—*Journal abstract.*

1331. Blanch, Andrea. (Cornell U) **The problem of feminine masochism: An approach through theory and literature.** *Cornell Journal of Social Relations*, 1974(Spring), Vol 9(1), 1-15.—Examines the existence and nature of the often postulated link between masochism and femininity. A review of some of the historically more important theoretical work on masochism is presented, as well as a look at the manner in which 4 prominent female authors (Mary McCarthy, Dorothy Parker, Colette, and Sylvia Plath) deal with the subject in their work. 2 common assumptions about masochism are questioned: that masochistic behavior is always self-destructive or at least self-defeating and that women display more "masochism" than men. The suggestion is made that it might prove more fruitful to treat masochism as a behavior strategy than as a stable psychologically or socially determined personality characteristic. (20 ref)—*Journal abstract.*

1332. Boeters, U.; Börner, J. & Grahmann, H. (U Kiel, Psychiatric & Neuroclinic, W Germany) **[The differential-diagnostic relevancy of pulse frequency in acute endogenous psychoses.]** (Germ) *Nervenarzt*, 1972(Mar), Vol 43(3), 160-163.—Examined the pulse rate of 40 patients hospitalized for the 1st time with diagnoses of endogenous depressive, manic-depressive, schizophrenic, and affective psychoses. 5 men and 5 women, randomly selected Ss, were examined during the

1st 3 days before treatment, in order to avoid any distortion by administered drugs. 30 other patients with neurologic disorders not related to cardiovascular processes were used as controls. Results demonstrate than an increased pulse per second rate and distinct fluctuations can be statistically determined, particularly in cyclic affective disorders, and confirm the differential-diagnostic relevancy of the pulse rate. (17 ref)—*T. Fisher.*

1333. Bowers, Malcolm B. (Yale U, Medical School) **Retreat from sanity: The structure of emerging psychosis.** New York, NY: Human Sciences Press, 1974. 245 p. \$9.95.—Presents a collection of case studies and interview data to document the characteristic processes and states of developing psychosis. Specific types of psychoses discussed include those associated with heterosexual rejection, adolescent psychosexual development, psychedelic drug use, childbirth, and marital crisis. The idea of the altered state in psychosis and implications for theory and treatment of psychotic states are also examined. (9% p ref)

1334. Breidenbaugh, Barry; Brozovich, Richard & Matheson, Loks. (Oakland Schools, Pontiac, MI) **The Hand Test and other aggression indicators in emotionally disturbed children.** *Journal of Personality Assessment*, 1974(Aug), Vol 38(4), 332-334.—Suggests that the Acting-Out Score (AOS) derived from the Hand Test may be useful as a predictor of aggressive, acting-out behavior. Data are presented on (a) the stability of the AOS, (b) its relation to person drawings used to assess aggressive potential, and (c) its ability to predict teacher ratings of acting-out behavior among 36 male and 4 female emotionally disturbed 8-13 yr olds. Results indicate that for this group of Ss, the AOS lacked stability as a measurement construct, did not correlate with the person drawings, and was not a useful predictor of acting-out behavior.—*Journal abstract.*

1335. Corney, Robert T. & Horton, Frederick T. (Vanderbilt U, Medical School, Adult Psychiatric Outpatient Clinic) **Pathological grief following spontaneous abortion.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 825-827.—Describes a patient who developed acute, disturbing symptoms several months after a spontaneous abortion during early pregnancy. Anamnesis is revealed that her symptoms were not the usual ones of acute grief but were representative of pathological grief, a complication of mourning. It is felt that the recognition of pathological grief is important, because it may prove resistant to the usual treatment measures for depression.

1336. Cytryn, Leon & McKnew, Donald H. (Children's Hosp of the District of Columbia, Washington) **Factors influencing the changing clinical expression of the depressive process in children.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 879-881.—Conceptualizes a pattern of defense against the depressive process that changes with age. Several forces are suggested that oppose or promote these defensive operations, resulting in 3 levels at which the depressive process manifests itself: fantasy, verbalization, and mood and behavior. The shifting balance of these forces may explain the variability with which the depressive process manifests itself throughout the various phases of the life cycle.—*Journal abstract.*

1337. Degossely, M. (U Liege, Belgium) [The feeling of depersonalization.] (Fren) *Acta Psychiatrica Belgica*, 1973(Mar), Vol 73(2), 311-320.—Reviews the literature on depersonalization and concludes that this syndrome appears both with and without delirious symptoms. Nevertheless it should be seen as a unity. It can signify a defense against a psychosis, and its neurotic significance should not be overlooked. (Dutch, English, German, Italian & Spanish summaries) (27 ref)—E. Coché

1338. Delacato, Carl H. **The ultimate stranger: The autistic child.** Garden City, NY: Doubleday, 1974. 226 p. \$6.95.—Based on the author's own observation, research, and experiments, it is suggested that autism is a neurological, rather than a psychological disorder and that autistic children suffer from sensory distortions. The ways in which perceptually-oriented therapy can help autistic children are outlined, and case histories and suggestions for parents of autistic children are presented. (8 p ref)

1339. Diebold, K. (U Heidelberg, Psychiatric Clinic, W Germany) [Hereditary and environmental aspects of endogenous psychoses.] (Germ) *Nervenarzt*, 1972(Feb), Vol 43(2), 69-76.—Discusses the influence of hereditary and environmental factors on the origin, development, and transmission of endogenous psychoses, illustrated by the case of a 15-yr-old female patient with a history of suicide attempts and atypical dysphoric depression. The literature and research on the genetic and hereditary aspects of schizophrenic, manic-depressive, and atypical endogenous psychoses is reviewed, in particular that on the transmission of schizophrenia in monozygotic twins. It is stated that hereditary disposition is a necessary factor in endogenous psychoses but by itself is not, in many cases, a sufficient trigger for their manifestation (as evidenced by twin research). The study of the preventive or triggering effect of environmental factors and their etiological and pathogenetic significance is a task of the utmost urgency. A causal therapy must take into account the environmental factors and the somatic foundations of endogenous psychoses in order to be able to compensate for pathologic genetic influences. (1 p ref)—T. Fisher.

1340. Dieckhöfer, K. & Payk, Th. R. (Rheinischen Friedrich Wilhelms U Bonn, Neuroclinic, W Germany) [A casuistic contribution to the problem of episodic twilight states.] (Germ) *Nervenarzt*, 1972(Feb), Vol 43(2), 103-106.—Presents a detailed report on the case of a 35-yr-old male patient with episodic disturbances of consciousness and twilight states of predominantly endogenous or hysterical nature. The psychodynamic background, triggering factors, and reactions are described and analyzed and the frequent and serious difficulties of differential diagnosis are discussed. (27 ref)—T. Fisher.

1341. Donnelly, Edward F. & Murphy, Dennis L. (National Inst of Mental Health, St Elizabeths Hosp, Washington, DC) **Primary affective disorder: Bender-Gestalt sequence of placement as an indicator of impulse control.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1079-1082.—Compared Bender Gestalt Test protocols of 37 bipolar (depression and mania) and 30 unipolar (depression alone) patients hospitalized for depression for sequential patterns of placement on the

test paper. Of 11 Ss with an irregular sequence and 11 Ss with an overly methodical sequence, 9 were subsequently identified as bipolar and 10 as unipolar, respectively. When these 2 groups with contrasting sequences were compared on the Hypomania (Ma) and Psychasthenia (Pt) scales of the MMPI, the bipolar group had significantly higher scores than the unipolar group on the Ma scale and significantly lower scores on the Pt scale. Results suggest that irregular sequence of placement and lack of impulse control are more characteristic of bipolar depression and overly methodical sequence and impulse control are more characteristic of unipolar depression. —Journal abstract.

1342. Foa, E. B. & Chatterjee, B. B. (Temple U, Medical School) **Self-other differentiation: A cross-culturally invariant characteristic of mental patients.** *Social Psychiatry*, 1974(Jul), Vol 9(3), 119-122.—Studied perception of behavior toward self and toward significant others in psychiatric patients from 3 cultures (US, India, and Senegal) and compared it to normal perceptions in Ss from the same culture. The Role Behavior Test was used to assess the frequency of occurrence of 8 types of interpersonal behavior generated by combining elements of 3 interpersonal dimensions. It was hypothesized that schizophrenics would differentiate least between self and other, that normals would differentiate most, and that mildly disturbed individuals would occupy an intermediate position in their degree of occupancy. Results support the hypotheses for all 3 cultures and for different types of roles (e.g., wife-husband, daughter-father, or son-father).—L. Gorse.

1343. Freeman, Thomas. (Holywell Hosp, Antrim, Northern Ireland) **Childhood psychopathology and psychotic phenomena in adults.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 556-563.—Discusses similarities between aspects of childhood psychopathology and aspects of adult psychotic behaviors in the areas of delusions and fantasies, psychomotor phenomena, and disturbances of affect. 3 types of content in adult psychotic delusions are identified, and although delusions are not common manifestations of child disorders, it is important to recognize when they cease to be products of the imagination and assume a central role in personality. Hyperactivity appears to be a common concomitant of psychopathology in both children and adults and may be related to acting-out behaviors. Severe anxiety which frequently reaches a state of panic is also a similarity in child and adult mental disorders. The question of how much significance to attach to these similarities is discussed, along with the hypothesis that childhood phenomena may be precursors of the adult manifestations. (16 ref)—L. Gorse.

1344. Friedman, J. Henry. (Tufts—New England Medical Ctr, Boston, MA) **Woman's role in male impotence.** *Medical Aspects of Human Sexuality*, 1974(Jun), Vol 8(6), 8-23.—Reports several cases in which the role of the woman was influential in the development and maintenance of psychogenic impotence. Previous studies suggest that a high percentage of wives of impotent patients were sexually inhibited, extremely sensitive, narcissistic, and viewed sexual intercourse as a "gift" from a man. Clinical observations of impotent males indicate that they share important

characteristics, including limited sexual experience before marriage and a view of women as nonsexual persons. In relationships of this type, a woman may unconsciously discourage all sexual contact and deny the importance of her activity for an adequate male response. Suggestions for psychotherapy are presented, and it is concluded that the role of interpersonal factors in impotence has been underrated, that the woman's response may be a major component of male impotence, and that clinicians should intensively study the interpersonal dynamics of impotence.—*L. Gorsey.*

1345. **Gajago, Christine & Prior, Margot.** (Monash U, Clayton, Vic, Australia) **Two cases of "recovery" in Kanner syndrome.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 264-268.—Reports case histories of 2 children thought to be classical cases of Kanner syndrome (early infantile autism). Despite the severity of their symptoms in the preschool years, they are now functioning adequately both intellectually and socially and are progressing normally at local schools.

1346. **Gardiner, A. Q.; Petersen, J. & Hall, D. J.** (Royal Cornhill Hosp, Aberdeen, Scotland) **A survey of general practitioners' referrals to a psychiatric outpatient service.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 536-541.—Conducted structured interviews with 689 patients (mean age = 35 yrs) referred to a Scottish clinic for outpatient psychiatric consultation during 1965-1966 to obtain data on the patient's attitude toward the referral, characteristics of the referring general practitioner (GP), the type of prior treatment, and any unusual events experienced during the treatment period. Neurotic, character, and behavior disorders were the most common diagnoses. 68% of the patients had been prescribed psychotropic drugs by their GP, 55% failed to take the drugs as prescribed, and 50% reported unusual events. Women consulted GPs more frequently, were seen at home more often, and were referred to specialist treatment later than men. 67% were satisfied with the treatment they had received from the GP, and 62% welcomed psychiatric referral. (22 ref)—*Journal summary.*

1347. **Gjesdal, Knut & Stromme, Johan H.** (U Tromso, Inst of Clinical Medicine, Norway) **Multiphasic screening programme for somatic diseases among elderly long-term psychiatric patients.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 564-572.—Subjected 41 long-term (1-40 yrs) 38-91 yr old psychiatric patients in a Norwegian hospital to a multiphasic screening program consisting of hematological, clinical chemical, urine bacteriological, dental, and chest X-ray examinations. 15% of 1,230 laboratory results were abnormal. The screening procedure led to 36 previously unknown diagnoses, and 21 patients were subsequently treated for 1 or more disorders. Prior to the screening, somatic disorders were known to affect 66% of the patients; after screening, this was increased to 78%. The magnitude of somatic problems in this group of patients warrants the establishment of regular laboratory screening programs in psychiatric hospitals. A minimal laboratory profile is suggested which consists of 9 parameters that should be determined annually and 4 parameters that should be determined at admission. (45 ref)—*Journal summary.*

1348. **Glatzel, J.** (U. Mainz, Neuropsychiatric Clinic, W. Germany) **[Autochthonic asthenia.]** (Germ) *Fortschritte der Neurologie, Psychiatrie und ihrer Grenzgebiete*, 1972(Nov), Vol. 40(11), 596-619.—Discusses the development of autochthonic asthenia, a psychopathological syndrome characterized by disturbance of thought, dysphoria, and abnormal body sensations. The 4 typical stages are described. Stage 1 is the phase of simultaneous, separate, predominantly somatic discomfort and disturbance, with headaches, sweating, heart pains, weakness, exhaustion, etc. Stage 2 exhibits predominantly affective disorders: sadness, depression, and general vital dysphoria, with difficulty in concentrating, feelings of inertia, inactivity, loss of vitality, etc; the elements of this stage are not clearly separated. Stage 3 shows disturbed perception, alienation, derealization, depersonalization, changes in intensity and emphasis, and hypersensitivity. Stage 4 is a phase of coanesthesia and thought disturbance, poor concentration, memory, recall, discrimination, ideation, etc. For the time being the nosological definition of autochthonic asthenia remains unsolved. (English summary) (2 p ref)—*T. Fisher.*

1349. **Glatzel, J.** (U. Mainz, Neuro-Psychiatric Clinic, W. Germany) **[The concept of symptoms in psychopathology.]** (Germ) *Nervenarzt*, 1972(Jan), Vol. 43(1), 33-36.—Discusses the definition and concepts of symptoms, syndromes, and symptom clusters in clinical psychopathology and the importance of correct isolation, definition, classification, and diagnosis.

1350. **Goldberg, Lois S. & Meltzer, Gloria.** (Glassboro State Coll) **IES arrow-dot comparisons for drug addicts with neurotic and delinquent personalities.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 636-638.—Administered the Arrow-Dot subtest of the Impulses-Ego-Superego Test to 20 male 16-28 yr old Ss in a therapeutic drug community and 20 male 17-28 yr old Ss in a methadone maintenance program. The subtest discriminated significantly between the personality integration of Ss in the therapeutic community and delinquents or neurotics. The scores of the methadone Ss on some variables, however, were not significantly different from those of neurotics and delinquents.—*Journal abstract.*

1351. **Gomes de Araújo, H. A.** **[Neurosis and personality.]** (Germ) *Fortschritte der Neurologie, Psychiatrie und ihrer Grenzgebiete*, 1972(Nov), Vol. 40(11), 619-628.

1352. **Green, Arthur H.; Gaines, Richard W. & Sandgrund, Alice.** (State U New York, Downstate Medical Ctr, Div of Child & Adolescent Psychiatry, Brooklyn) **Child abuse: Pathological syndrome of family interaction.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 882-886.—Observed patterns of family interaction encountered in 60 cases of child abuse. The maltreatment syndrome is described as the end result of 3 potentiating factors: the abuse-prone personality of the parent, characteristics of the child that make him vulnerable for scapegoating, and current environmental stress. Role reversal was a prominent feature in the psychodynamic makeup of these families. The parents tended to endow the child with negative characteristics derived from their own experience with rejecting parents. 6 case examples are included. (16 ref)—*Journal abstract.*

1353. Gurland, Barry J.; Stiller, Pamela; Sharpe, Lawrence & Fleiss, Joseph L. (New York State Dept of Mental Hygiene, Biometrics Research, New York) **Alternative diagnoses as an aid to psychiatric classification.** *Psychiatric Quarterly*, 1973, Vol 47(4), 533-545.—6 research-team psychiatrists applied main and alternative diagnoses to 500 consecutive admissions in a New York state psychiatric hospital and a London area mental hospital. A group of patients was isolated with an affective disorder as the main diagnosis and schizophrenia as the alternative diagnosis. In symptoms and outcome this group was intermediate between groups of patients where there was no alternative diagnosis, or where the main and alternative diagnoses were both of an affective disorder or of schizophrenia. Further analysis showed that the use of alternative diagnoses made it possible to identify those diagnoses which were creating uncertainty and confusion between categories. Appropriate measures could then be taken to improve the use of these diagnoses.—*Journal abstract*.
1354. Guterman, Andrew. (U Miami, Medical School) **Manifest psychopathology and serum creatine phosphokinase: A correlational study.** *Diseases of the Nervous System*, 1973(Jan), Vol 34(1), 49-53.—Studied the relationship between psychopathology and abnormalities in creatine phosphokinase (CPK) activity in 20 psychotic and 3 nonpsychotic psychiatric inpatients. Double-blind enzyme determinations were compared to ratings on a brief psychiatric rating scale. There were significant positive correlations between CPK activity and degree of psychopathology, as determined from several subtests of the rating scale. Although there was no difference between psychotic and nonpsychotic groups, it is concluded that CPK activity and psychoses are intimately related. (21 ref)—*M. Oscar-Berman*.
1355. Hahn, Susanne & Müller, Heidrun. (Karl Marx U, Psychiatric Clinic, Leipzig, E Germany) **[A psychosociometrical procedure for objectivating the degree of psychiatric patients.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jan), Vol 26(1), 14-24.—Discusses statistically significant differences between normal Ss and psychiatric patients on the basis of an unpublished questionnaire dealing with psychosocial attitudes. Test items measure social communication, use of leisure time, social contacts at work, and attitudes toward marriage partner and family.—*K. J. Hartman*.
1356. Hart, James D. (VA Ctr, Wood, WI) **Physiological responses of anxious and normal subjects to simple signal and non-signal auditory stimuli.** *Psychophysiology*, 1974(Jul), Vol 11(4), 443-451.—In an attempt to assess orienting (OR) and defensive responses (DR) of 18 male anxious inpatients and 18 normal males, heart rate (HR) and skin conductance (SC) changes were measured in response to 3 intensities of signal and nonsignal tones. Anxious Ss significantly differed from normal Ss in the number of spontaneous SC responses emitted, but did not differ in either magnitude or rate of habituation of SC responses to the tones. An analysis of second-by-second changes in HR suggested that, relative to normal Ss, anxious Ss showed a deficit in OR and a greater tendency to respond with a pattern characteristic of a DR. This difference was particularly apparent under signal conditions.—*Journal abstract*.
1357. Heath, Robert G.; Cox, Aris W. & Lustick, Leonard S. (Tulane U, Medical School) **Brain activity during emotional states.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 858-862.—Reports that when a 41-yr-old female suffering from severe anxiety was prepared with deep and surface electrodes, correlations were demonstrated between activity at certain brain sites and pleasurable or painful affect. Moreover, a functional relationship was shown between these sites for emotional expression and some sensory relay nuclei. Findings substantiate previous observations made in the 1954 Tulane University depth electrode series and add meaning to anatomic and physiologic data from animal studies that have shown an integral relationship between brain sites involved in sensory perception and those for emotional expression.—*Journal abstract*.
1358. Hennessey, B. L. & Bruen, W. J. (Australian Dept of Health, Woden, ACT) **Youth in Canberra: Results and implications of a mental health survey.** *Australian & New Zealand Journal of Psychiatry*, 1974(Mar), Vol 8(1), 55-59.—Preliminary results of interviews indicate that adolescents in Canberra were more healthy than adults in terms of drug intake and psychiatric impairment. Adolescents cited career decisions as their major developmental problem, and disruption of family relationships as the major life stress. Implications for provision of adolescent psychiatric services are discussed.
1359. Horrobin, D. F. (U Newcastle upon Tyne, England) **Prolactin and mental illness.** *British Journal of Psychiatry*, 1974(May), Vol 124, 456-457.—Notes that many drugs used in psychiatry influence the level of prolactin secreted by the hypothalamus. Because of the known actions of prolactin, it may be responsible for stress and premenstrual tension effects, and the prolactin level may be associated with such diverse conditions as depression, mania, and schizophrenia.
1360. Humphrey, John A.; French, Laurence; Niswander, G. Donald & Casey, Thomas M. (U North Carolina, Greensboro) **The process of suicide: The sequence of disruptive events in the lives of suicide victims.** *Diseases of the Nervous System*, 1974(Jun), Vol 35(6), 275-277.—Reviewed the case histories of 160 completed suicides in an attempt to determine whether there were consistent patterns of problematic events in their lives which may have resulted in their self-destruction. Focus was placed on the sequential ordering of disruptions in social relations or loss of social roles. It was found that loss of roles in childhood and early adolescence, parents, home, siblings, close relatives, and student role tended to be followed by chaotic marriages, loss of occupational role(s), and loss of physical and/or mental health. In addition, parental roles tended to be lost through the death of a child. Results indicate that loss of social roles leads to high vulnerability to suicide.—*Journal summary*.
1361. Itil, T. M.; Hsu, W.; Saletu, B. & Mednick, S. (New York Medical Coll, Div of Biological Psychiatry, NY) **Computer EEG and auditory evoked potential investigations in children at high risk for schizophrenia.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 892-900.

1362. **Kedward, H. B. & Sylph, Judith.** (Clarke Inst of Psychiatry, Toronto, Ontario, Canada) **The social correlates of chronic neurotic disorder.** *Social Psychiatry*, 1974(Jul), Vol 9(3), 91-98.—Studied the social functioning and adjustment of 50 female patients suffering from a nonpsychotic psychiatric illness of at least 1-yr duration, and compared it with that of a demographically similar group of women free of psychiatric symptoms. After psychiatric screening, a specially designed social interview schedule was administered, covering a wide range of social circumstances and activities which were rated under material conditions, social functioning, and satisfaction. Results show that the index group, though matched for income level and family size, were less well-placed materially than control patients, functioned less well, and were markedly less satisfied with their lot. Implications of this finding for the medical services in the area are discussed, and the feasibility of a social service approach to the problems experienced by this type of patient is considered.—*Journal abstract.*
1363. **Kelleher, M. J. & Copeland, J. R.** (U London, Inst of Psychiatry, England) **Assessment of neurotic symptoms in Irish female patients.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 554-555.—Reports higher scores of Irish female Ss on the Cornell Medical Index (Sections M-R), Present State Examination, and the Leyton Obsessional Inventory in 3 separate comparative studies of Irish and British psychiatric patients. Results suggest caution in interpreting scores of Irish females on scales which were standardized with reference to different populations.
1364. **Kirk, Stuart A.** (U Kentucky) **The impact of labeling on rejection of the mentally ill: An experimental study.** *Journal of Health & Social Behavior*, 1974(Jun), Vol 15(2), 108-117.—Presented a questionnaire containing 1 of 3 case vignettes depicting either severely or moderately mentally ill persons or a normal person (actors) to 864 community college students. At the end of each case description was a sentence in which a particular person (labeler) offered an interpretation (label) of the behavior described. 4 levels of labeler variables were systematically altered in the descriptions; labelers were either a psychiatrist, the actor's family, the actor himself, or "some people." All Ss then completed a social rejection index to measure their reactions to the actor described. Results show that labels and labelers did not produce significant effects. Only behavior influenced social rejection—the greater the deviation, the greater the social rejection. Although labeling theory suggests that the use of labels radically alters the way people perceive and react to rule-breaking behavior, the present data do not support this idea. (42 ref)—*L. Gorsey.*
1365. **Koestenbaum, Peter.** (California State U, San Jose) **Managing anxiety: The power of knowing who you are.** Englewood Cliffs, NJ: Prentice-Hall, 1974. vi, 183 p. \$7.95(cloth), \$2.95(paper).—Describes an existential approach to handling anxiety which can help resolve many types of personal problems and increase self-awareness. Tests and exercises are included to evaluate personal development and to design programs for individual needs. The idea that pain underlies all negative experiences is examined within a philosophical context.
1366. **Krakowski, Adam J. & Langlais, Louis M.** (Champlain Valley-Physicians Hosp Medical Ctr, Div of Psychiatric Liaison & Research, Plattsburgh, NY) **Acute psychiatric emergencies in a geriatric hospital.** *Psychosomatics*, 1974, Vol 15(2), 72-75.
1367. **Kraus, Robert F.** (U Washington, Medical School) **Schizophrenia as a genetic polymorphism.** *Psychiatric Quarterly*, 1973, Vol 47(4), 546-558.—A brief review of the literature reveals convincing evidence for a genetic factor in the etiology of schizophrenia. This evidence suggests that a tendency toward development of the disease is inherited; its appearance and clinical features depend upon environmental and experiential factors. The question of the mechanism by which the genes responsible for schizophrenia maintain their levels in human populations in the face of the obvious selective disadvantage conferred by the disease is as yet unanswered. The works of L. L. Heston (1970) and of J. L. Karlsson (1968) suggest that a selective advantage may accrue to the heterozygote, a mechanism explainable in terms of the concept of genetic polymorphism as described by E. B. Ford (1965). (25 ref)—*Journal abstract.*
1368. **Lifshitz, Kenneth & Gradjan, Jack.** (Rockland State Hosp, Research Ctr, Orangeburg, NY) **Spectral evaluation of the electroencephalogram: Power and variability in chronic schizophrenics and control subjects.** *Psychophysiology*, 1974(Jul), Vol 11(4), 479-490.—Evaluated selected EEG parameters for their ability to discriminate between a group of 30 male chronic schizophrenic patients and 30 control Ss. For each S 150 random EEG segments were collected. Results confirm that the coefficient of variation of the absolute EEG potential recorded from the occiput is significantly smaller in schizophrenics than in controls. The power density spectrum was calculated for each EEG segment.  $\beta$  power was significantly higher in patients, markedly so in the  $\beta_2$  band. Coefficients of variation were calculated for the power in EEG frequency bands for each S. The most significant discriminator between schizophrenics and controls, considered to be artifact free, was the coefficient of variation of  $\beta$ , recorded from an anterior-posterior electrode pair at the vertex. (32 ref)—*Journal abstract.*
1369. **Marchant, Rosemary; Howlin, Patricia; Yule, William & Rutter, Michael.** (U London, Inst of Psychiatry, England) **Graded change in the treatment of the behaviour of autistic children.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Jul), Vol 15(3), 221-227.—Discusses a method of introducing slight and gradual changes into the autistic child's environment. The case histories of a 5-yr-old and a 7-yr-old boy are presented in which this technique was used to reduce the attachment to objects, at the same time working on increasing sociability and attachment to people. Theoretical implications of such attachments are discussed together with more general applications of such a treatment technique.—*Journal summary.*
1370. **Martin, William A. & Smith, Allen O.** (Tulane U, Medical School) **The evaluation of dementia.** *Diseases of the Nervous System*, 1974(Jun), Vol 35(6),

262-265.—Evaluated 11 patients with dementia of various etiologies. The results of EEGs, skull films, lumbar puncture, and brain scan were compared to results of pneumoencephalography, isotope, cisternography, and a constant infusion manometric test for measurement of cerebrospinal fluid absorption. The EEG proved to be the most effective screening procedure in establishing the organic basis of symptoms in early dementia. Pneumoencephalography was the most useful definitive contrast procedure in the demonstrating space occupying lesions, cerebral atrophy, and possibly normal pressure hydrocephalus. Results of the constant infusion manometric tests did not correlate with pneumoencephalography or cisternography. There was no consistent difference between patients with normal pressure hydrocephalus and dementia of other etiologies. It is concluded that the infusion test, at its current stage of development, is of dubious clinical value as a simple diagnostic procedure. (18 ref)—*Journal abstract*.

1371. Mattocks, Arthur L. & Jew, Charles C. (California Dept of Corrections, Medical Facility, Vacaville) **Comparison of self-actualization levels and adjustment scores of incarcerated male felons. Educational & Psychological Measurement**, 1974(Spr), Vol 34(1), 69-74.—Tested whether high scores on the Personal Orientation Inventory (POI) test of self-actualization are correlated with scores of the "well-adjusted person" as defined by the Q-Sort Adjustment Scale POI profiles of male prisoners who participated in group psychotherapy in a correctional psychiatric institution were examined: 25 high self-actualizing inmates and 31 low self-actualizing inmates were selected for comparison in terms of the Q-Sort Scale. Inmates who were higher in POI self-actualization also scored significantly higher on their Q-Sort adjustment than those who scored low on self-actualization. Thus, the study provides evidence of consistency between the concept of a well-adjusted individual and the concept of self-actualization. That is, the higher the level of self-actualization, the better the adjustment; the lower the level of self-actualization, the poorer the adjustment.—*Journal abstract*.

1372. Mazer, M. (Martha's Vineyard Mental Health Ctr, Edgartown, MA) **People in predicament: A study in psychiatric and psychosocial epidemiology. Social Psychiatry**, 1974(Jul), Vol 9(3), 85-90.—Presents a study of the entire population ( $N = 4,519$  residents) of an American island community at risk for a 5-yr period to the experience of a variety of human predicaments of psychiatric or psychosocial nature. Data show that females were more often aware of the presence of psychological distress than were males and sought psychiatric help more often. Males, on the other hand, were more likely to show their distress by coming to the attention of educational, legal, and social agencies. Adolescents and young adults had high rates of acting out and low rates of psychiatric consultation. Disorders in awareness tended to be a higher-class phenomenon and acting out a characteristic of those in the lower social-class positions. Data show that, though males were in predicament as frequently as females, they were more likely to come to the attention of nonpsychiatric agencies. Since females were apparently more aware of distress, they responded positively more often to the

instrument used in many total prevalence studies. It is suggested that total-prevalence surveys include items which will elicit the presence of parapsychiatric or psychosocial events and that psychiatric services be revised to be more inviting to those who express their psychological difficulties by acting out.—*Journal abstract*.

1373. McIntosh, James R. (Lehigh U) **Perspectives on marginality: Understanding deviance**. Boston, MA: Allyn & Bacon, 1974. xii, 314 p.—Presents both a textbook and a collection of readings on deviance, social disorganization, and social problems. Topics include the history and current status of the sociology of deviance, and discussions of the labeling, anomie, differential association, and subculture theories of deviance.

1374. Mendlewicz, J. (New York State Psychiatric Inst, Columbia U) [New genetic concepts regarding manic-depressive psychosis.] (Fren) *Acta Psychiatrica Belgica*, 1973(Mar), Vol 73(2), 209-232.—Investigated 13 families of patients with manic-depressive psychosis and other hereditary signs. A statistically significant link between this illness and 3 different genetic markers located on the X-chromosome was found. Findings support the hypothesis of a dominant X-linked factor in the genetic transmission of manic-depressive psychosis. Genealogical illustrations and a discussion of these results in the light of modern biochemical theories of manic-depressive illness are included. (Dutch, English, German, Italian & Spanish summaries) (22 ref)—E. Coché

1375. Merrill, Richard H. & Collins, James L. (Brooke Army Medical Ctr, Ft Sam Houston, TX) **Acute psychosis in chronic renal failure: Case reports. Military Medicine**, 1974(Aug), Vol 139(8), 622-624.—Presents 2 cases of acute psychoses which occurred in patients with chronic renal failure, but which were not felt to be primarily due to uremia. In both patients, a 38-yr-old and a 31-yr-old woman, the psychotic symptoms did not seem to be clearly attributable to metabolic disturbances, and there were no abnormal neurological signs. The pattern of mental disorder was more typical of a nonorganic psychosis. In each case the stress of a serious chronic illness was increased because of significant situational (e.g., financial and marital) conflicts. These factors, together with the acute stresses of surgery and peritoneal dialysis, were sufficient to precipitate a psychotic episode. Implications of psychosis in relation to chronic dialysis and transplantation are discussed.—L. Gorsey.

1376. Mitchell, Alexander R. (Fulbourn & Addenbrooke's Hosp, Cambridge, England) **Schizophrenia: The meanings of madness**. New York, NY: Taplinger, 1972. 158 p. \$6.50.—Briefly interprets the meanings of madness in history and in current thought and art, and discusses the import of madness to insanity and to psychiatry. The definitions and clinical features of schizophrenia and psychological tests for its diagnosis are described, as well as individual and community methods for the management of the disorder.

1377. Mombour, W. (Max Planck Inst of Psychiatry, Munich, W Germany) [International classification of mental diseases.] (Fren) *Acta Psychiatrica Belgica*, 1973(Mar), Vol 73(2), 256-271.—Introduces and discuss-

es the "Mental Disorders" category of the "International Classification of Diseases." The advantages of such a system for international comparisons and research is stressed. (Dutch, English, German, Italian & Spanish summaries) (22 ref)

1378. Montgomery, George K.; Paul, Gordon L. & Power, Christopher T. (U Wisconsin, Madison) **Influence of environmental contingency history on acquisition of new discrimination by chronic mental patients.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 339-347.—Evaluated acquisition of new discriminations on 2-choice and 2-dimensional (form and color) tasks under response-contingent reinforcement as a function of nearly 4 yrs' history of total-life environments of response-contingent vs noncontingent experiences. A total of 28 chronic mental patients, half from each history condition, were prescreened on component skills and presence of a manipulable reinforcer. Groups were equated on demographic variables and current level of functioning. No differences in acquisition were found as a function of contingency history. However, correlational analyses with multiple measures of current functioning and responsiveness to treatment showed that differential relations existed within groups. The latter relations suggest that the response-contingent environment resulted in greater attention to discriminative stimuli and greater consistency between task-related and extraneous behaviors. (27 ref)—*Journal abstract*.

1379. Mormont, C. (U Liege, Psychiatric Clinic, Belgium) **[Borderline cases in the light of Rorschach.]** (Fren) *Acta Psychiatrica Belgica*, 1973(Mar), Vol 73(2), 321-331.—Presents a study of 25 Rorschach records of borderline personalities. It is concluded that there is no unified syndrome which permits easy identification of borderline cases but that the Rorschach provides a better understanding of individual cases. (Dutch, English, German, Italian & Spanish summaries) (24 ref)

1380. Naditch, Murray P. (Cornell U.) **Acute adverse reactions to psychoactive drugs, drug usage, and psychopathology.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 394-403.—Used a field survey method to examine the relationship between psychopathology and acute adverse reactions to psychoactive drugs. A paper-and-pencil measure of acute adverse reactions was developed and administered to 530 college students with drug-use experience. Acute adverse reactions were hypothesized to covary positively with regression, schizophrenia, and drug usage, and to covary negatively with adjustment and paranoia. These hypotheses were supported. The hypotheses that usage of LSD and mescaline would covary positively with regression and covary negatively with adjustment were also supported. A hypothesis that schizophrenia would positively covary with LSD and mescaline usage was not confirmed. Regression was also found to be related to marihuana usage. A recursive linear model was developed in an attempt to integrate and explain these results. (25 ref)—*Journal abstract*.

1381. Nagaraja, Jaya. **Psychiatric breakdown among students: A comparative study of the East and the West.** *Child Psychiatry Quarterly*, 1972(Apr), Vol 5(2), 11-27.—Describes the pressures on college students in India today. Sources of psychiatric breakdown include guilt

and insecurity following failure, choice of wrong career and subject, poor mental health in students' homes, transition from adolescence to adulthood, low socioeconomic status, the greater problems women face in attaining academic status, and conformity pressures. These problems are compared with those encountered by students at Western universities (specifically, at McGill University, Montreal, Canada), which are of 3 types: problems of youth and sex; problems of values; and problems of education, occupation, and immigration. Case studies to illustrate the effects of both societies on students are provided. (15 ref)—*R. S. Albin*.

1382. Narramore, Bruce. (Rosemead Graduate School of Psychology, Calif.) **Guilt: Its universal hidden presence.** *Journal of Psychology & Theology*, 1974(Spr), Vol. 2(2), 104-115.—Proposes that the emotion of guilt is to some degree involved in the etiology of all psychological maladjustments. A discussion of the Genesis record of the origin of guilt is followed by a discussion of the major defensive processes used to deny and distort the subjective experience of guilt. The psychological and theological implications of the failure to recognize the extent of involvement of guilt in the problems of adjustment is also considered.—*Journal abstract*.

1383. Neuringer, Charles. (U Kansas) **Attitudes toward self in suicidal individuals.** *Life-Threatening Behavior*, 1974(Sum), Vol 4(2), 96-106.—Studied data on attitudes toward the self and other people from 45 male 21-55 yr old suicidal, psychosomatic, and normal hospitalized patients using semantic differential ratings. Data were analyzed by comparing the ratings of "Myself" and "Other People" (and their divergencies) made by the 3 groups of Ss on the Evaluative, Activity, and Potency factors of the semantic differential. Suicidal individuals had the (a) lowest self-appraisal, (b) highest other appraisal, and (c) greatest self-other divergency among the 3 groups. The effect was greatest on the Potency factor, giving rise to the speculations that feelings of impotency may be extremely critical for the production of suicidal activity.—*Journal abstract*.

1384. Nunn, C. et al. (Knowle Hosp, Fareham, England) **Intelligence and neurosis in old age.** *British Journal of Psychiatry*, 1974(May), Vol 124, 446-452.—Tested elderly persons living in the community on a shortened Wechsler Adult Intelligence Scale, and assessed their physical, social, and psychiatric state. The sample was divided into normals and a group of 62 neurotics. With a 6-yr follow-up, a significant correlation was found between low intelligence and neurosis. Other variables associated with diagnosis as neurotic were somatic illness, few social contacts, deafness, and female sex.—*R. L. Sulzer*.

1385. Oishi, Katsuyo. (Ochanomizu U, Tokyo, Japan) **[A comparison of semantic structure among college students, junior high school boys and schizophrenic patients.]** (Japn) *Japanese Journal of Psychology*, 1974(Apr), Vol 45(1), 21-32.—Administered a semantic differential questionnaire to 111 undergraduates, 82 junior high school boys, and 73 schizophrenic patients. The same 3 dominant factors were extracted from the responses of all groups, and each of these factors accounted for the same proportion of the total variance. The concept *me* was separated from the other concepts

in terms of the locations of all concepts in 3-dimensional space. It is suggested that the isolation of the self-concept is reflected in disturbances of interpersonal relations and autism. 7 concepts (*teacher, sickness, doctor, God, peace, sex, and love*) significantly differentiated the schizophrenic and the undergraduate Ss. The distribution of categories checked also differentiated the undergraduate and schizophrenic Ss, a finding which indicates that scale-checking styles are related to personality variables.—*English abstract.*

1386. Overall, John E.; Henry, B. W. & Woodward, Arthur. (U Texas Medical Branch, Psychometric Lab, Galveston) **Dependence of marital problems on parental family history.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 446-450.—Examined the relation of marital complaints to family history in 1,624 psychiatric outpatients. Marital complaints were recognized to be an aspect of a broader "depressive spectrum disorder" with distinctive age, gender, alcohol, and neurotic depressive symptom characteristics. However, holding constant the depressive spectrum characteristics, a specific independent relation of marital complaints to family history of parental marital discord was verified. It is concluded that marital problems have 2 primary etiologies in the psychiatric population, one as part of a broader depressive spectrum disorder and the other a more specific familial behavior patterning.—*Journal abstract.*

1387. Overbeck, Gerd & Brähler, Elmar. (U Giessen, Psychosomatic Clinic, W Germany) **[Observations of speech behavior of patients with psychosomatic disturbances.]** (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(2), 100-108.—Observed 2 therapists and 4 patients and recorded their speech-pause behavior during 40-50 treatments of 1 hr/wk. The number of long pauses (more than 10 sec) followed by speech by the therapists was significantly greater with patients having psychosomatic disturbances.—*English summary.*

1388. Pfeiffer, Eric. (Duke U, Medical School) **Borderline states.** *Diseases of the Nervous System*, 1974(May), Vol 35(5), 212-219.—Considers the historical development of the concept of borderline state, the phenomenology of this state, and treatment methods used. The borderline patient is characterized by (a) a limited range of affects, with anger and anxiety predominating; (b) deficits in affective relationships; (c) lack of a definitive self-identity; (d) proneness to periods of depressive loneliness; and (e) lack of integration of the total personality. He may also overuse defense mechanisms and may be subject to "minipsychoses." The goal of therapy is to help the patient improve in interpersonal relationships and skills and integrate his total life experience, using an eclectic approach. (23 ref)—A. Olson.

1389. Pfeiffer, Kenneth & Maltzman, Irving. (U. California, Los Angeles) **Warned reaction times of sociopaths.** *Journal of Research in Personality*, 1974(Jun), Vol. 8(1), 64-75.—Employed a warned reaction time (RT) task with 8 male sociopaths and 8 normal males (mean age = 33 yrs). A warning light appeared at a variable interval preceding a light to which the S responded by pressing a key. All Ss received both a regular and an irregular series with warning intervals of

1, 2, 4, 8, and 16 sec. In the regular series, blocks of intervals were presented in an ascending order. In the irregular series each interval followed every other interval equally often. Sociopaths obtained reliably slower RTs than did control Ss, showing a constant decrement across all intervals in the 2 kinds of series.—*Journal abstract.*

1390. Pontius, Anneliese A. **Threats to assassinate the king-president while propitiating mother: Some aspects of dangerousness.** *Journal of Analytical Psychology*, 1974(Jan), Vol 19(1), 38-53.—Discusses 2 aspects of the unconscious motives for assassinating a king-president, as expressed in the delusional systems of 2 schizophrenics. 2 hypotheses are offered: the impersonal and suprahuman character of the threat to assassinate, and the constellation of the "great mother" in association with the king-president's assassination. Anthropological material and clinical examples are presented. (16 ref)—P. Federman.

1391. Reker, Gary T. (Trent U, Peterborough, Ontario, Canada) **Interpersonal conceptual structures of emotionally disturbed and normal boys.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 380-386.—Asked 24 disturbed and 24 normal boys (mean age = 10.5 yrs) to construe 12 persons known personally to them and 12 familiar inanimate objects on 2 sets of 12 5-point bipolar constructs. Ss were also asked to arrange the people and inanimate objects into personally meaningful groups. There was significantly lower differentiation and articulation, but not integration, in the interpersonal conceptual structure of disturbed Ss compared to normal controls. No differences were found in construing inanimate objects. Results are interpreted as indicating that disturbed boys are handicapped by a limited interpersonal conceptual structure for anticipating and predicting their social environment. (23 ref)—*Journal abstract.*

1392. Reynolds, E. H. & Travers, R. D. (Yale U, Medical School) **Serum anticonvulsant concentrations in epileptic patients with mental symptoms.** *British Journal of Psychiatry*, 1974(May), Vol 124, 440-445.—Examined the relationship of chronic anticonvulsant therapy and mental symptoms in 118 outpatients. Higher levels of anticonvulsant drugs were found in the blood of patients showing psychomotor slowing, intellectual deterioration, psychiatric illness, or personality change. Toxic effects of this kind may not be noticed in persons with brain damage or long-standing mental retardation. Hence, measurements of drug concentrations are valuable.—R. L. Sulzer.

1393. Roberts, Margaret A. & Schuham, Anthony I. (Florissant Valley Community Coll) **Word associations of schizophrenics and alcoholics as a function of strength of associative distracter.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 426-431.—L. J. Chapman's "response bias" theory of word association behavior (see PA, Vol 33:10697) predicts a hierarchy of responses in schizophrenic associations, whereas W. E. Broen's 1968 "response interference" theory does not. The existence of a "true hierarchy," (i.e., at least 3 ordered levels of responsiveness) was explored in 30 male chronic schizophrenics and 30 male alcoholic controls under conditions of high-, medium-, and low-associative

distraction. Schizophrenics manifested significantly more associative errors at successive levels of associative distraction, and their error curve almost precisely approximated a straight-line function. Results support the notion of hierarchical responding central to Chapman's theory as well as independently replicating earlier studies of schizophrenic word association behavior.—*Journal abstract.*

1394. Schildkraut, Joseph J. (Massachusetts Mental Health Ctr, Neuropsychopharmacology Lab, Boston) **Biogenic amines and affective disorders.** *Annual Review of Medicine*, 1974, Vol 25, 333-348.—Reviews recent studies, with emphasis on those predicting different responses to treatment and those likely to produce biochemical criteria for classifying types of affective disorders. Biogenic amines covered are 3-methoxy-4-hydroxyphenylglycol, homovanillic acid, 5-hydroxyindoleacetic acid, dopamine- $\beta$ -hydroxylase activity, catechol-O-methyltransferase activity, and monoamine oxidase activity. Among other conclusions is the predicted development of a nosology based not only upon clinical manifestations of affective disorders, but also upon knowledge of the underlying biochemical mechanisms. (119 ref)—*B. Gurel.*

1395. Schmidt, Chester W. (Baltimore City Hosp, MD) **Psychiatric problems of the aged.** *Journal of the American Geriatrics Society*, 1974(Aug), Vol 22(8), 355-359.—Discusses depression as the most important of the various psychiatric illnesses (including organic brain syndromes, schizophrenia, neuroses, and personality disorders) that may develop in old age. The symptoms and the relationship to suicide are discussed. Therapeutic efforts (e.g., chemotherapy, electroshock, and psychotherapy) may be directly affected by the physician's attitude. Drugs for the treatment of depression include the tricyclic antidepressants, monoamine oxidase inhibitors, amphetamines, phenothiazines, minor tranquilizers, and lithium. Electroshock is indicated for suicidal or medically endangered patients or for those who do not respond to chemotherapy. It is stressed that the psychiatric skills of the family practitioner are important in helping the patient to adjust to the crises of old age and in preventing mental illness.—*Journal abstract.*

1396. Schneider, Regine. [Borderline-syndrome in children.] (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(2), 109-126.—Discusses (a) therapy with children with a diagnosis of infantile borderline syndrome, (b) the disturbed family background regularly observed in such cases, and (c) the need to correlate this background with the infantile symptom formation. 3 cases are described, with particular attention to a typical "borderline mother" who suffered from severe identity anxiety about her role and function as mother. Sudden changes from a child-rejecting attitude to overprotective behavior caused severe guilt feeling. The behavior of the child, who exhibits marked oversensitivity, lack of frustration tolerance, sudden fits of rage, and clinging dependence on the unreliable mother may be the consequence of archaic ego-disturbance and age-specific ego immaturity. The infantile borderline syndrome is seen as the forerunner of the adult borderline syndrome.—*English summary.*

1397. Schuckit, Marc A. & Gunderson, E. K. (US Navy Medical Neuropsychiatric Research Unit, Epidemiology & Operational Psychiatry Div, San Diego, CA) **Psychiatric incidence rates for Navy women: Implications for an all volunteer force.** *Military Medicine*, 1974(Jul), Vol 139(7), 534-536.—Reports data from the records of 1,470 enlisted female psychiatric patients admitted to US Navy facilities during 1965-1968. Findings are compared with data from the records of 12,350 enlisted male psychiatric patients admitted during the same period. The change in hospitalizations with age was similar for men and women; however, the actual female rates were 2-4 times higher up to age 30, after which the incidence rates converged. The average female inpatient was younger, had less military experience or status, and was more often single than the average male inpatient. Diagnoses of personality disorder and alcoholism were assigned to men more often than to women (51 vs 37%), but women were given diagnoses of situational maladjustment more frequently than men. The finding that more men than women received disability separations or retirements (20 vs 9%) may indicate more severe cases among the male patients. Reasons for the higher prevalence rates among women are examined, and implications for Navy policy and psychiatric procedures are noted. (15 ref)—*L. Gorsey.*

1398. Schwab, John J.; Fennell, Eileen B. & Warheit, George J. (U Louisville) **The epidemiology of psychosomatic disorders.** *Psychosomatics*, 1974, Vol 15(2), 88-93.—Interviewed 1,645 households, randomly selected from a sample of 37,000. Psychosomatic symptoms during the previous year were recorded with sociodemographic characteristics. Weight changes were noted in 40% of the interviews, indigestion (35%), other gastrointestinal symptoms (22-26%), headaches (9%), hypertension (6%), and other symptoms. Differences by sex, race, income, etc., are reported. (17 ref)—*A. S. Kulkarni.*

1399. Shapiro, M. B. (U London, Inst of Psychiatry, England) **The role of conflict in the genesis and treatment of neurosis.** *British Journal of Psychiatry*, 1974(May), Vol 124, 458-459.—Pavlov demonstrated that conflict can produce disordered animal behavior, and Freudian theory emphasized the role of unresolved conflicts in producing neurotic behavior. If clinical psychologists are to be applied scientists, they should make more systematic use of the well validated theory of conflict in investigating and in treating neurotic disorders.

1400. Sherman, Mark. (Syracuse U) **Impression management: Patient perceptions of the efficacy of psychiatric self-presentation.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 459-462.—Studied the perceived efficacy of patients' attempts to influence discharge dates through psychiatric self-presentation as a function of the perceivers' own self-presentation inclinations and length of hospitalization. 40 male patients on an acute treatment ward and 40 on a chronic treatment ward heard 1 of 4 taped interviews on which an ostensible patient revealed that he planned to engage in either healthy or sick self-presentation and that the psychiatrist of this ostensible patient was either in favor of or opposed to discharge. Judgments about when the taped patient would be discharged were influenced by

the taped patient's plans but not by his psychiatrist's opinion. Ss' chronicity but not self-presentation inclinations were related to their judgments.—*Journal abstract.*

1401. Sherman, Mark; Sprafkin, Robert & Higgins, Kenneth. (Syracuse U) **Perceived efficacy and interpersonal impact of impression management among psychiatric patients.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 440-445.—100 hospitalized male psychiatric patients listened to 1 of 4 audiotapes on which an interviewed patient revealed his intentions to engage either in healthy or sick self-presentation. The taped patient also reported his psychiatrist to be either in favor of or opposed to early discharge. Ss predicted longer lengths of hospitalization for the taped patients, and found him to be less interpersonally attractive, when he intended to fake psychopathology. Predicted length of hospitalization was also longer when the taped patient's psychiatrist was reportedly opposed to early discharge.—*Journal abstract.*

1402. Simensen, Richard J. (Armstrong State Coll) **Correlations among Bender-Gestalt, WISC Block Design, Memory-for-Designs, and the Pupil Rating Scale.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1249-1250.—Administering the Bender Gestalt Test, the Block Design subtest of the WISC, the Memory-For-Designs Test, and the Pupil Rating Scale to 87 3rd, 4th, and 5th graders. The resulting correlation matrix and coefficients of determination indicate that these tests are measuring different variables; caution in their use as assessments of minimal brain dysfunction is advised.

1403. Singh, M. V.; Paliwal, T. R. & Gupta, S. (Maulana Azad Medical Coll, New Delhi, India) **Frustration reaction among emotionally disturbed children.** *Child Psychiatry Quarterly*, 1972(Apr), Vol 5(2), 3-10.—Compared the frustration reactions of emotionally disturbed and normal children in terms of type of reaction, direction of aggression, superego patterns, and group conformity ratings. Ss were 50 children with emotional problems (enuresis, hysteria, and anxiety reactions), 25 children selected randomly from an observation home for boys who were charged with stealing and running away from home, and 75 normal primary school children matched with these groups. The delinquent groups differed from the normal Ss in the type of reaction to frustration and in the direction of aggression. Enuretics and hysterics showed differences in their superego patterns. Group conformity ratings showed no differences among the groups.—*R. S. Albin.*

1404. Stamford, Bryant A.; Hambacher, William & Fallica, Anthony. (Woodville State Hosp, Carnegie, PA) **Effects of daily physical exercise on the psychiatric state of institutionalized geriatric mental patients.** *Research Quarterly*, 1974(Mar), Vol 45(1), 34-41.—Administered the Draw-A-Person Test, the Wechsler Adult Intelligence Scale (WAIS) Digit Span and Information subtests, and a specially developed ward activity and current events attitude measure to 9 male psychiatric inpatients (mean age = 71.5 yrs) who exercised 5 times/wk for 12 wks by walking on a motorized treadmill at workloads which elicited 70% of the age-adjusted, predicted maximal heart rate, 8 control patients (mean age = 65.2 yrs) did not exercise but received the same type of social stimulation as did the exercise Ss.

Physiological (treadmill and bicycle ergometer stress tests) and the psychological assessments were conducted before and after the 12-wk program. Exercise Ss showed significantly decreased heart rates and systolic blood pressure scores, and significant changes on the WAIS Information subtest and the attitude measure compared to the control Ss. (19 ref)—*L. Gorsey.*

1405. Stoller, Alan & Krupinski, Jerry. (Mental Health Authority, Melbourne, Vic, Australia) **Aspects of psychiatric morbidity in adolescents in Victoria, Australia.** *Australian & New Zealand Journal of Psychiatry*, 1974(Mar), Vol 8(1), 61-69.—Summarizes data obtained by the authors and other researchers on psychiatric morbidity in Australian adolescents related to drug-taking, alcoholism, suicidal behavior, delinquency, and car accidents. The psychiatric adjustment of adolescent migrants and Aborigines is discussed. (17 ref)

1406. Stolorow, Robert D. (Livingston Coll, Rutgers State U, New Brunswick) **Perspectives on death anxiety: A review.** *Psychiatric Quarterly*, 1973, Vol 47(4), 473-486.—A review of psychoanalytic and philosophical writings on death anxiety indicate that it is a multifaceted phenomenon which has been interpreted at several levels of analysis—including the level of infantile conflict and intrapsychic structural tensions, the level of primary instincts, the level of object relations, and the level of ontological givens. An attempt is made to group the defenses against death anxiety into 4 general modes: concretization, being-as-a-part, being-as-oneself, and absolute faith. The material presented supports a thesis that death anxiety and defenses against it are important factors in human development. (47 ref)—*Journal abstract.*

1407. Szasz, Thomas S. **The myth of mental illness: Foundations of a theory of personal conduct.** (Rev ed). New York, NY: Harper & Row, 1974. xvi, 297 p. \$8.95.—Posits that what is termed "mental illness" is, in fact, behavior disapproved of by the speaker—a stigmatizing moral judgment, not a medical diagnosis. It is stressed that only voluntarily sought psychiatric interventions can help people change their personalities or behavior. Semiotic, rule-following, and game-model analyses of behavior are discussed. (9 p ref)

1408. Thom, Achim & Weise, Klaus. (Karl-Marx-U, Leipzig, E Germany) **[Is the concept of the "psychiatric disease" a myth? The value and limitation of the medical model for psychiatry in our society.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1973(Dec), Vol 25(12), 705-711.—Argues that most psychical disturbances are not diseases. The conventional medical model of the West is challenged by the Marxist-Leninist theory of consciousness. The traditional concept of disease still remains valid for a number of psychical disturbances which are unequivocally somatic in origin.—*K. J. Hartman.*

1409. Verma, S. K.; Shah, D. K. & Bhatia, S. C. **Enuresis in children: A psychological study.** *Child Psychiatry Quarterly*, 1972(Apr), Vol 5(2), 28-34.—Studied 26 cases diagnosed as enuresis. Among 200 emotionally disturbed children, these 26 were predominantly male, from an urban area, and from upper- and middle-class families. The group showed a high incidence of neurotic traits other than enuresis, family history of

mental illness, pathological parental attitudes, marital disharmony, sibling rivalry, and parental deprivation. These findings suggest that a long-standing maladjusted family interaction may have led to precipitation and/or continuation of enuresis. (21 ref)—*R. S. Albin.*

1410. Vogel, B. Frank. (Mental Health Inst, Clinical Services, Cherokee, IA) **The Capgras syndrome and its psychopathology.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 922-924.—Presents 5 case reports which indicate that the Capgras syndrome, a condition in which the patient believes that a person closely related to him is actually an imposter, is far less rare than has been commonly accepted. The psychodynamics of the syndrome are discussed, and it is suggested that it is a massive defense system against disintegrative intrapsychic conflicts.

1411. Vurdelja-Magljalic, Dada & Jordan, John E. (Pedagogic Academy, Osijek, Yugoslavia) **Attitude-behaviors toward retardation of mothers of retarded and non-retarded in four nations.** *Training School Bulletin*, 1974(May), Vol 71(1), 17-29.—Used the Attitude Behavior Scale-Mental Retardation (ABS-MR) to study attitudes of a total of 410 mothers of retarded and nonretarded in the US, Germany, Israel, and Yugoslavia. The Guttman facet-theory-derived ABS-MR measures attitudes on 6 levels of strength on an abstract-impersonal to concrete-behavioral continuum. As hypothesized, (a) attitudes toward retardation were more positive in the underdeveloped nations and/or samples of the study; (b) mothers of retarded were more positive than mothers of the nonretarded; (c) efficacy, (man's sense of control over his social and physical environment), was predictive of positive attitudes; (d) knowledge about retardation did not predict positive attitudes; (e) amount of contact did not predict positive attitudes unless accompanied by perceived voluntariness and enjoyment of the contact; and (f) the simplex order among the 6 scale levels of the ABS-MR was achieved. Data contain implications for teacher training and selection. (30 ref)—*Journal abstract.*

1412. Wagner, Edwin E. & Heise, Marion R. (U Akron) **A comparison of Rorschach records of three multiple personalities.** *Journal of Personality Assessment*, 1974(Aug), Vol 38(4), 308-331.—Presents inter- and intra-protocol comparisons among the Rorschach Test responses of 3 authenticated cases of multiple personality—a 14-yr-old girl with 3 other personalities, a 28-yr-old woman with 7 different personalities, and a 34-yr-old woman with at least 2 other well developed personalities and fragments of others. Protocols were characterized by a large number of movement responses; human movement (M) decreased with the development of successive personalities. F and F+ percentages were relatively normal, and color responses, while not predominant, were labile. A tendency toward simplification and reintegration occurred with the emergence of new personalities for 2 of the cases. E. E. Wagner's structural analysis of personality is used to explain the results and specify the necessary conditions for the development of multiple personality.—*L. Gorsey.*

1413. Watson, Charles G. (VA Hosp, St Cloud, MN) **Effects of content verbalness and intangibility on schizophrenics' deficits in abstract thinking.** *Psychologi-*

*cal Reports*, 1974(Jun), Vol 34(3, Pt 2), 1115-1118.—Earlier research has suggested that schizophrenics' deficits on conceptual tasks could reflect special difficulties with verbal or intangible stimuli rather than inability to abstract correctly per se. In the present study the performance of 37 process and 32 reactive male schizophrenics on similarities tests varying in verbalness and intangibility of stimuli was compared to that of 35 nonschizophrenic psychiatric male patients. No special deficits associated with verbal stimulus presentation or stimulus intangibility appeared in either process or reactive samples.—*Journal abstract.*

1414. Weinstein, Raymond M. (John Jay Coll of Criminal Justice, City U New York) **Mental patients' perceptions of illness etiology.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 798-802.—Administered a questionnaire to 517 psychiatric inpatients to determine their perceptions of the factors contributing to their illness in terms of the economic, family, and social problems they experienced. Childhood problems of all types were reported and connected to illness less frequently than were adult problems. Patients often placed various difficulties concerning worries, failures, rejections, and interpersonal conflicts in an etiological context but not those difficulties which concerned deprivations and hardships. Statistically significant relationships were observed between the number of problems that patients believed were responsible for their illness and the patients' age, marital status, diagnosis, and length of hospitalization. Type of hospital commitment was related to a lesser extent; sex, social class, and prognosis were unimportant variables. (20 ref)—*Journal abstract.*

1415. Weise, Klaus. (Karl Marx U, Psychiatric Clinic, Leipzig, E Germany) **[Diagnosis of psychiatric diseases.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1974(Jan), Vol 26(1), 6-13.—Discusses a hypothesis relating psychopathological syndromes to etiopathic factors and psychopathic symptoms. Criticizes conventional diagnostic psychiatric concepts and the nonspecificity of psychopathological syndromes.

1416. Williams, C. L.; Henderson, A. S. & Mills, Janet M. (U Tasmania, Royal Hobart Hosp, Australia) **An epidemiological study of serious traffic offenders.** *Social Psychiatry*, 1974(Jul), Vol 9(3), 99-109.—Compared 100 persons who were found guilty of serious traffic offences with 99 controls matched for age, sex, residential district, and type of driver's license held. A demographic questionnaire, Raven's Progressive Matrices, the 16 Personality Factor Questionnaire, Hostility and Direction of Hostility Questionnaire, the General Health Questionnaire, and the Eysenck Personality Inventory were administered to all Ss. More offenders than controls had experienced recent adversity in their lives, had a greater evidence of nonpsychotic psychiatric disorder, and were more impulsive and lower in social conscience. This study represents an attempt to identify high-risk individuals in the driving population, and the implications of these findings for prevention are discussed. (44 ref)—*Journal abstract.*

1417. Wise, Thomas N. (Johns Hopkins U Hosp) **The pitfalls of diagnosing depression in chronic renal**

disease. *Psychosomatics*, 1974, Vol 15(2), 83-84.—Presents 5 case histories as examples.

1418. Wolkind, S. N. (London Hosp Medical Coll, Family Research Unit, England) **The components of "affectionless psychopathy" in institutionalized children.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Jul), Vol 15(3), 215-220.—Notes that classical "affectionless psychopathy" of institutionalization is no longer a commonly found syndrome in residential care. The individual clinical features which make up the syndrome, however, are each described as occurring very commonly. A psychiatric study of 92 5-12 yr old children in long-stay residential care suggests that the main features of the syndrome have a different etiology. Antisocial behavior was found to relate to aspects in the child's family, and relationship difficulties to an early admission to care. (17 ref)—*Journal summary*.

1419. Woodruff, Robert A.; Guze, Samuel B. & Clayton, Paula J. (Washington U, Medical School) **Psychiatric illness and season of birth.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 925-926.—Obtained data from a research clinic to test the hypothesis that patients with schizophrenia and manic-depressive illness are born early in the year more frequently than would be expected by chance. No evidence of seasonal variation of birth for patients with any specific diagnosis was found.

1420. Woodward, Christel A.; Roberts, Robin S.; Santa-Barbara, Jack & Johnson, Yvonne. (McMaster U, Hamilton, Ontario, Canada) **Discriminating externalizing from internalizing emotionally disturbed children with the Ottawa School Behaviour Checklist.** *Canadian Journal of Behavioural Science*, 1974(Jul), Vol 6(3), 277-289.—Examined the Ottawa School Behaviour Checklist responses of 73 latency-aged (mean age = 10 yrs) emotionally disturbed children to determine whether the checklist is equally effective in detecting children who experience various types of emotional difficulties. Results indicate that Ss using externalizing methods of coping scored higher than internalizing Ss. High scores are supposed to indicate more severe disturbance. Internalizing and externalizing styles were determined by independent psychiatric assessment. Discriminate function analyses were used to isolate those items that distinguished both externalizers from internalizers and psychotic from nonpsychotic Ss. Results indicate that the Ottawa School Behaviour Checklist item pool is more effective in screening emotionally disturbed troublesome children than in detecting equally disturbed troubled children. (French summary) (16 ref)—*Journal abstract*.

#### Behavior Disorders

1421. Arnon, Dan; Kleinman, Marc H. & Kissin, Benjamin. (State U New York, Downstate Medical Ctr, Div of Alcoholism and Drug Dependence, Brooklyn) **Psychological discrimination in heroin addicts.** *International Journal of the Addictions*, 1974, Vol 9(1), 151-159.—Tested 30 male and 31 female heroin addicts for field dependence using a portable rod-and-frame test. Scores were compared to results obtained by P. K. Oltman (see PA, Vol 42:11431) from a normal population. The addicts were more field-dependent than normals. The female addicts, however, were significantly more field-

dependent than male addicts who, conversely, appeared similar to normal males. Both addict samples were characterized by marked variability, suggesting that heroin addicts represent a strongly heterogeneous population and not a homogenous one as suggested by earlier studies. (19 ref)—*Journal abstract*.

1422. Babow, Irving & Babow, Robin. (California Polytechnic State U.) **The world of the abused child: A phenomenological report.** *Life-Threatening Behavior*, 1974(Spr), Vol. 4(1), 32-42.—Presents a verbatim interview of one 21-yr-old suicidal woman who had a long history of abuse by her mother. Some theoretical issues concerning the scientific and clinical usefulness of phenomenological reports in the understanding of child abuse (and other aberrant behavior) are briefly discussed.—*Journal abstract*.

1423. Baldwin, John. (U Birmingham, Inst of Judicial Administration, England) **Social area analysis and studies of delinquency.** *Social Science Research*, 1974(Jun), Vol 3(2), 151-168.—Argues that there are several fundamental conceptual and procedural problems in using E. Shevky and W. Bell's 1955 method of delineating urban social areas for analyzing delinquency rates. Those researchers who have used the method have done so uncritically; very often this approach has served to obscure rather than clarify the social patterning of delinquency. (45 ref)

1424. Barraclough, B. M. (MRC Clinical Psychiatry Unit, Graylingwell Hosp, Chichester, England) **Poisoning cases: Suicide or accident.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 526-530.—Used data from death certificates in England and Wales during 1968-1970 to show that the distribution of fatal drugs recorded for suicides, accidents, and undetermined deaths are similar. The possibility that real suicides are often misclassified is discussed, and differences between the actual and expected incidence of suicide are examined.

1425. Blath, Richard A.; McClure, James N. & Wetzel, Richard D. (Vanderbilt Hosp., Nashville, Tenn.) **Familial factors in suicide.** *Diseases of the Nervous System*, 1973(Feb), Vol. 34(2), 90-93.—Presents the case histories of 2 identical female 28-yr-old twins who both made serious suicide attempts within 2 yrs of each other. The literature on suicide in twins is discussed. It is suggested that further studies of the families of suicides be made, including studies of the transmission of traits affecting suicide risk. (19 ref)—*Journal summary*.

1426. Blumberg, Herbert H. et al. (U London, Inst of Psychiatry, Addiction Research Unit, England) **British opiate users: I. People approaching London drug treatment centres.** *International Journal of the Addictions*, 1974, Vol 9(1), 1-23.—Conducted interviews with 210 English narcotics addicts, all of whom had contacted outpatient drug treatment centers during a 1-yr period and who had had no significant previous clinic contacts. Descriptions of family and demographic backgrounds, current life-styles, illegal activities, initial and current drug use, periods of abstinence, and physical complications are presented. (27 ref)

1427. Buglass, Dorothy & Horton, John. (MRC Unit for Epidemiological Studies in Psychiatry, Edinburgh, Scotland) **A scale for predicting subsequent suicidal**

**behaviour.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 573-578.—Obtained data on 2,809 patients admitted to the Regional Poisoning Treatment Centre in Edinburgh after an act of attempted suicide in 3 successive years (1968-1970), and compared nonrepeaters with patients who were subsequently readmitted for further suicide attempts within 12 mo of their 1st attempt or who committed suicide. A scale predicting subsequent suicidal behavior was constructed on the 1968 data by allocating 1 point for each of the following symptoms: sociopathy, alcohol abuse, previous psychiatric inpatient or outpatient treatment, previous suicide attempt (resulting in hospitalization), and not living with a relative. The predictive power of the scale was tested by mean cost ratings (MCR). Data suggest that the scale validates reasonably well, and its applications to evaluative studies are discussed.—*Journal summary.*

1428. **Cahalan, Don & Room, Robin.** (U California, School of Public Health, Berkeley) **Problem drinking among American men.** New Brunswick, NJ: Rutgers Center of Alcohol Studies, 1974. xiv, 269 p. \$12.50.—Results of 2 national surveys and 1 community survey reveal that drinking problems are fairly common among 21-59 yr old males, particularly 21-24 yr olds. Types of problems related to alcohol are delineated, prevalence rates in various subgroups are presented, and the relationships between the problems and sociocultural and personality characteristics are discussed.

1429. **Calderon Narvaez, Guillermo.** (National Autonomous U Mexico, Faculty of Medicine, Mexico City) **Alcoholism among the pre-Hispanic peoples of Mexico.** *Foreign Psychiatry*, 1973-1974(Win), Vol 2(4), 78-92.—Discusses the use of pulque, a fermented drink made from the maguey plant, among the pre-Hispanic Mexicans, as described by Fray Bernardino de Sahagún in *History de las Cosas de la Nueva Espana*. The mythology, symbolism, and religious significance of the maguey and its goddess Mayahuel are described. Although Mexican peoples had many deities of drink and drunkenness, and although they believed that a man born under the sign "2 rabbit" of their fortune-telling calendar was predestined to alcoholism, they took a stern view of drunkenness. The problems of the drunkard, Fray Bernardino says, are poverty, illness, and crime. Social ostracism, strict discipline of the young, counseling, threats from the rulers, and harsh punishments—beatings, imprisonment, and death—did not solve the problem. Only old men, who had completed an active life and would not be a burden on society, were allowed the pleasures of drink. The Spaniards abolished the severe penalties as "inhuman," and a sharp increase in alcoholism followed.—*J. Davis.*

1430. **Christensen, Harold T.** (Purdue U) **Interview with a transsexual.** *Family Coordinator*, 1974(Jul), Vol 23(3), 243-250.—Presents a transcript of an interview between a professor of sociology and a 24-yr-old male transsexual. Topics discussed include sexual and emotional relationships, the effects of a confused sexual identity during childhood and adolescence, the experience of a sex change operation, and the psychological aspects of sex and role transition.

1431. **Cohen, Stuart L. & Fiedler, Joanne E.** (Suicide Prevention Research Project, Pittsburgh, PA) **Content**

**analysis of multiple messages in suicide notes.** *Life-Threatening Behavior*, 1974(Sum), Vol 4(2), 75-95.—Compared 220 persons who committed suicide and who left notes with 813 suicides who did not leave notes. Note writers were significantly more likely to be white, female, and if female, to have any other marital status than widowed. Note writers were also more likely to have committed suicide with drugs and less likely to have used other methods. In 195 notes available for analysis, the relative percentages of statements containing advice, instructions, and requests (31), other-directed positive affect (19), acknowledgement of wrongdoing (7), and hostile affect (5) were the same in the entire sample as in subsamples of age, sex, and marital status. Only for a few specific content categories did the relative frequency of content vary significantly with age, sex, or marital status. (20 ref)—*Journal abstract.*

1432. **Cox, Thomas J. & Longwell, Bill.** (Hope Ctr, Tucson, AZ) **Reliability of interview data concerning current heroin use from heroin addicts on methadone.** *International Journal of the Addictions*, 1974, Vol 9(1), 161-165.—In a methadone maintenance program with 110 heroin addicts, data concerning current heroin use from 175 interviews were correlated with the results of urinalysis for heroin. In 86% of the interviews, the patients truthfully reported the extent of their current heroin use to the interviewer.

1433. **Evans, Joseph H.** (Boys Town, NB) **Attitudes of adolescent delinquent boys.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1175-1178.—It has previously been suggested that the attitudes of juvenile offenders are qualitatively different from those of "normal" male adolescents. The present study attempted to assess quantitative differences in the attitudes of 20 13-15 yr old male offenders and 20 male nondelinquent controls toward disabled, retarded, aged, alcoholic, and mentally ill persons. Juvenile offenders exhibited significantly less favorable attitudes than did nondelinquent controls.—*Journal abstract.*

1434. **Ferrence, Roberta G. & Johnson, F. Gordon.** (Addiction Research Foundation, London, Ontario, Canada) **Factors affecting reported rates of self-injury.** *Life-Threatening Behavior*, 1974(Spr), Vol. 4(1), 54-66.—The magnitude of variation in reported rates of self-injury suggests that factors other than actual incidence affect these rates. Factors that relate to the scope of the reporting network and to the intensity of contacts within this network are examined in detail to determine their effect on the reporting process. Differences in study design and reporting procedures are felt to explain most of this variation and suggest the need for standardized techniques in studying the epidemiology of self-injury.—*Journal abstract.*

1435. **Gath, Ann.** (U Oxford, England) **Sibling reactions to mental handicap: A comparison of the brothers and sisters of mongol children.** *Journal of Child Psychology & Psychiatry & Allied Disciplines*, 1974(Jul), Vol 15(3), 187-198.—Parents and teachers completed behavioral rating scales on 89 sisters and 85 brothers of 104 mongol children living at home. Disturbance in the boys, known to be not significantly more frequent than in controls, was related to family size and social class. Disturbance in the girls, known to be more frequent than

in controls, was related to type of school, birth order, and age in relation to the mongol child. It is concluded that the presence of a mongol child in the home is associated with deviant behavior as assessed by parents and teachers, and with educational failure in elder sisters, who are probably carrying a large share of the burden of care. (25 ref)—*Journal summary*.

1436. Gossop, M. R.; Stern, R. & Connell, P. H. (Bethlem Royal Hosp, Drug Dependence Clinical Research & Treatment Unit, London, England) **Drug dependence and sexual dysfunction: A comparison of intravenous users of narcotics and oral users of amphetamines.** *British Journal of Psychiatry*, 1974(May), Vol 124, 431-434.—Analyzed psychosexual histories for incidence of perversions and for evidence of diminished sexual functioning. Length of drug usage was not related to degree of dysfunction, and injection vs oral methods did not differ in frequency of perversions; but the intravenous users had greater reduction in sexual activity than the pill poppers among the men. In general, female drug users had greater reduction in normal sexual functioning than males. Since disturbed female adolescents often have sexual problems, and female drug offenders are likely to be more disturbed than males, drug dependence may be one manifestation of deviance among females.—R. L. Sulzer.

1437. Guggenheim, Frederick G. & Weisman, Avery. (Massachusetts General Hosp., Boston) **Suicide in the subway: Psychodynamic aspects.** *Life-Threatening Behavior*, 1974(Spring), Vol. 4(1), 43-53.—Investigated 51 cases of suicide attempts in the subway to determine whether the method used had psychodynamic significance or was merely adventitious. No single characteristic distinguished subway suicide from all other suicide modalities, although as a group the subway cases had a higher proportion of psychotic and previously suicidal patients than other series quoted in the literature. However, there were important differences between subway suicide cases seeking a "traumatic" death (jumping in front of a train; lying across the track awaiting destruction) and those seeking a "nontraumatic" death (electrocution on the live "third rail"). The traumatic group had histories of exposure to violence, other traumatic suicide attempts, hostile or destructive delusions, and many "destroy" words on psychological test protocols. The smaller nontraumatic group had no such history of exposure to violence. Their previous suicide attempts were nontraumatic; delusions, when present, were not menacing; and the psychological tests showed more "escape" than "destroy" words.—*Journal abstract*.

1438. Hawk, Sherry S. & Peterson, Rolf A. (U Illinois, Chicago Circle) **Do MMPI psychopathic deviancy scores reflect psychopathic deviancy or just deviancy?** *Journal of Personality Assessment*, 1974(Aug), Vol 38(4), 362-368.—Administered the *Pd*, *K*, and *L* scales of the Minnesota Multiphasic Personality Inventory (MMPI) and 4 of Kohlberg's Moral Judgment Situations to 15 institutionalized adolescent delinquents, 196 undergraduates, and 15 members of a therapy collective which provides free community services. More than 50% of both the delinquent and therapy collective Ss were classified as psychopathic (*Pd* + *K*T score > 70). The

3 groups obtained significantly different moral maturity scores, with the therapy collective Ss having the highest mean scores. Results of 2 stepwise regression analyses found no relationship between *Pd* scores and moral maturity scores. (20 ref)—*Journal abstract*.

1439. Jackson, George W. & Richman, Alex. (US DHEW, Ctr for Disease Control, Mount Sinai School of Medicine, City U New York) **Alcohol use among narcotic addicts.** *Alcohol Health & Research World*, 1973(Spring), Vol 1(1), 25-28.—Conducted an epidemiological study of 471 heroin addicts and their concomitant alcohol abuse. Data included the level of daily use, demographic factors, duration of heroin addiction, and previous hospitalizations. Alcohol use among addicts was strongly associated with an increased duration of heroin addiction. 53% of the Ss reported multiple drug abuse, an ever-increasing problem that needs to be considered in treating and rehabilitating narcotic addicts.—H. J. Freudenberger.

1440. Kiley, D. E. (Illinois Dept of Corrections, Juvenile VAST Program, Decatur) **The effect of the research expectancy on the activity level of institutionalized delinquents.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 242-247.—Conducted a field study of 14 16-19 yr old delinquents housed in a minimal security, treatment-oriented program to study the dynamics of "demand characteristics" when a new set of expectancies was introduced. The independent variable was the introduction of a research expectancy (i.e., Ss were told they would be observed). The dependent variable was the frequency of 12 different behaviors in 4 categories (without peers, with peers, accounted for, and unaccounted for) which were assessed during 4 observational periods. Results show that (a) peer interactions decreased dramatically during the 1st wk following the introduction of the expectancy, and then slowly increased during the next 3 wks; (b) as peer interactions decreased, Ss tended to be unaccounted for (i.e., whereabouts unknown); and (c) activities performed without peers remained constant throughout the observations.—*Journal summary*.

1441. Krieger, George. (VA Hosp, Palo Alto, CA) **The plasma level of cortisol as a predictor of suicide.** *Diseases of the Nervous System*, 1974(May), Vol 35(5), 237-240.—Reports that there is an urgent need for additional diagnostic instruments to differentiate the high-risk suicide patient from the low-risk patient. Results of a study with a suicidal risk group of hospital inpatients indicate that 13 Ss who later committed suicide tended to have a higher mean plasma cortisol level (measured at 8:30 AM) than the 39 low-risk suicides who were living 2 yrs later. It is recommended that if a suicide risk patient has a plasma cortisol level above 20 µg%, in the absence of other possible causes for such a high level, he should be recognized as having a high potential for suicide and be provided with more protective precautions, more frequent contacts with his therapist, and prolonged aftercare. (17 ref)—*Journal summary*.

1442. Linkenbaker, Dan D. & McCarron, Lawrence T. (Johnston Youth Community, Terre Haute, IN) **Computerized assessment programming (CAP): A prescriptive strategy for delinquents.** *Behavioral Science*,

- 1974(Jul), Vol 19(4), 254-259.—Describes a complex, trilevel computerized system designed for the generation of specific diagnostic statements, individualized prescriptive remedial plans, and data storage for research with a juvenile delinquent population. The system output is a comprehensive, timely, and accurate diagnostic report capable of identifying specific problem areas related to delinquency and capable of offering individualized intervention techniques for use by institutional staff, parents, and teachers. Standards used in the construction of this system are presented as guidelines for the development of other computer-assisted diagnostic programs. (15 ref)—*Journal abstract*.
1443. Luthé, R. (U Saarland, Inst for Forensic Psychology & Psychiatry, Homburg, W Germany) [Experience structure of self-destructive tendencies in a group of adolescent delinquents.] (Germ) *Nervenarzt*, 1972(Feb), Vol 43(2), 88-94.—Studied suicidal tendencies in adolescent delinquents and describes observations of 3 groups: (a) 15 19-29 yr old Ss, highly suicide prone on the Poldinger scale, held in jail for investigation; (b) a randomly chosen control group of 15 delinquents of the same age, also jailed for investigation; and (c) a 2nd control group of 15 slightly older 2nd offenders, convicted and sentenced to jail. The incidence, psychological and psychopathological nature, and epidemiological aspects of suicidal tendencies, the presuicidal syndrome, and the relations between suicide and violence are examined, compared, and discussed.—*T. Fisher*.
1444. Mann, Marty. *America's 150-year war: Alcohol vs. alcoholism*. *Alcohol Health & Research World*, 1973(Spr), Vol 1(1), 5-7.—Traces the history of the alcoholism movement in the United States from the Mayflower to the frontiersmen, the temperance movement, and prohibition. The development of government commitment to the problem and of the cooperation of scientists and reformed alcoholics are discussed.—*H. J. Freudenberger*.
1445. Marks, Alan & Abernathy, Thomas. (MacMurray Coll.) *Toward a sociocultural perspective on means of self-destruction*. *Life-Threatening Behavior*, 1974(Spr), Vol. 4(1), 3-17.—Examined the relationship between an individual's intent to die and choice of method. A sociocultural perspective is developed in an attempt (a) to explain the principal differences in choice of method by sex, (b) to explain regional variations over time by sex, and (c) to differentiate between regional and/or cultural areas in their use of firearms as a means of self-destruction. The concept of availability is examined and shown to consist of at least 2 dimensions: the physical presence of a method, and the sociocultural acceptability of that method. A concept of suicidal threshold is advanced as suggestive of a suicidal level that an individual must reach before a suicidal process develops and results in self-inflicted death. (27 ref)—*Journal abstract*.
1446. McDaniel, Clarence E.; Owens, David & Bolman, William M. (San Diego County Mental Health Services, CA) *Bromide abuse: A continuing problem*. *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 913-915.—Presents case material on 8 patients who abused bromide drugs and also, with 1 exception, alcohol. 6 were white housewives. The clinical manifestations, diagnosis, and treatment of bromism and the need for increased awareness of bromide intoxication and stricter control of these drugs are discussed.
1447. Parker, A. Morgan. *Suicide among young adults*. New York, NY: Exposition Press, 1974. xii, 164 p. \$8.—Combines personal experience with findings of authorities in discussing attempted and completed suicide cases. Descriptive categories and statistical information in occurrence factors; psychoanalytic and nonpsychoanalytic theories of causes, dynamics, and motivations; and symptoms, methods, clinical findings, treatment, and prevention of suicide are discussed. (10 p ref)
1448. Pohle-Haase, Heidi & Schraml, Walter J. [Family constellation and obesity in young boys: A contribution to psychologic-sociologic etiology.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1972, Vol 20(3), 249-278.—Discusses psychological and social factors influencing the development of obesity in young boys. The literature on the effects of family structure and background on the pathogenesis of obesity is surveyed and important theories and research are outlined briefly. 62 case histories of boys in institutions were examined but most were considered incomplete, too subjective, and unreliable. Only 23 were comprehensive enough to justify from them even limited and tentative conclusions about possible connections between family background and the patients' obesity. It is felt, however, that a correlation between obesity and an overorganized family structure is highly probable, and 2 case histories which appear to support this theory are presented. (English summary) (3 p ref)—*T. Fisher*.
1449. Pokorny, Alex D. & Jachimczyk, Joseph. (Baylor Coll of Medicine, Houston, TX) *The questionable relationship between homicides and the lunar cycle*. *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 827-829.—Studied 2,494 homicides that occurred in Harris County, Texas, over a 14-yr period in an effort to confirm a recent study suggesting that homicides are significantly related to phases of the moon. No significant relationship was found, although homicides did show strong day-of-week and hour-of-day cycles.
1450. Roe, Allan V.; Howell, Robert J. & Payne, I. Reed. (Utah State Prison, Draper) *Comparison of prison inmates with and without juvenile records*. *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1315-1319.—From a sample of 404 inmates at a state prison whose records were adequate and complete, 259 had juvenile records and 145 had none. These 2 groups were compared on 47 behavioral and personal characteristics (including scores on subscales of the Bipolar Psychological Inventory). The inmates with juvenile records were significantly different from those without juvenile records on 17 of the 47 dimensions studied. The inmates with juvenile records were more hostile, socially deviant, and less motivated. They were also less well educated, more frequently unmarried (never married or currently divorced), had a greater number of prison write-ups, more often had an escape record, had abused drugs, and were tattooed.—*Journal abstract*.
1451. Sabalis, Robert F.; Frances, Allen; Appenzeller, Susan N. & Moseley, Willie B. (William S. Hall Psychiatric Inst, Columbia, SC) *The three sisters:*

**Transsexual male siblings.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 907-909.—Presents case material on 3 male siblings with a transsexual syndrome. It is probably the first such case recorded in the US and may lead to the discovery of other such sibships, which could be of particular value in assessing the validity of some of the literature concerning the etiology of this disorder.

1452. Selby, Henry A. (Temple U) **Zapotec deviance: The convergence of folk and modern sociology.** Austin, TX: University of Texas Press, 1974. xviii, 166 p. \$8.50.—Presents an ethnographic study of the causes, effects, characteristics, and functions of deviance among the Zapotec Indians in the Valley of Oaxaca, Mexico. Topics include the interactionist approach to the study of deviance, values and social groups in the Zapotec community, deviance and the social structure, ideologies and the definition of sexual deviance, witchcraft and the process of labeling, and the origins of good and evil among the Zapotecs. (9 p ref)

1453. Selzer, Melvin L. & Vinokur, Amiram. (U Michigan, Medical School) **Life events, subjective stress, and traffic accidents.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 903-906.—Administered a questionnaire on the type and number of life changes, resultant adjustment required, subjective and physical stress, aggression, and alcohol abuse to 532 normal and alcoholic male drivers. Several significant correlations between traffic accidents and life and subjective stress were found. Aggression was the only personality variable to correlate significantly with accidents. (20 ref)

1454. Smithyman, Samuel D.; Plant, Walter T. & Southern, Mara L. (California State U, San Jose) **Locus of control in two samples of chronic drug abusers.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1293-1294.—Compared the mean scores of heroin and multiple-drug users on Rotter's Internal-External (I-E) Control Scale with those of Rotter's normative sample. Results do not support previous suggestions of investigator bias toward internality as being indicative of good psychological adjustment on the I-E Scale.

1455. Straub, William F. & Felock, Thomas. (Ithaca Coll, School of Health, Physical Education & Recreation) **Attitudes toward physical activity of delinquent and nondelinquent junior high school age girls.** *Research Quarterly*, 1974(Mar), Vol 45(1), 21-27.—Administered a demographic questionnaire and Kenyon's Attitudes Toward Physical Activity Inventory (ATPAI) to 20 delinquent and 60 nondelinquent junior high school girls from a small rural school, a large urban school, and a correctional institution for girls. Significant differences were found on only 1 of the 6 subscales of the ATPAI ( $p < .01$ ). Nondelinquent Ss valued physical activity as a social experience more than did the delinquent Ss. No significant differences were found on the Vertigo, Aesthetic, Catharsis, or Ascetic scales. Multiple discriminant function analyses, however, showed that there were significant differences in attitudes between Ss from rural schools and those from urban schools and between Ss who were institutionalized and those who were not.—L. Gorsey.

1456. Sutker, Patricia B. (VA Hosp, Charleston, SC) **Personality characteristics of heroin addicts: A response to Gendreau and Gendreau.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 463-464.—Demonstrating the effect of the volunteer factor on Minnesota Multiphasic Personality Inventory (MMPI) profiles of addicts and nonaddicts, P. Gendreau and L. F. Gendreau (see PA, Vol 51:5403) suggested that previously reported MMPI differences between these 2 subject groups might well be explained by the "volunteer" status of the addict group. The present article describes more thoroughly the unincarcerated addict sample, almost half of whom were compulsory candidates for treatment, and presents data from previous studies by P. B. Sutker and A. N. Allain (1973, 1974) to show that volunteer and nonvolunteer applicants were more similar than different on MMPI indices. Results of a follow-up investigation, however, point to the role of situational factors in elevating MMPI profiles of 82 unincarcerated addicts who, addicted to heroin and involved in the cycle of street activities at the time of testing, differed significantly from prisoner groups of 35 addicts and 87 nonaddicts on several important dimensions. Similarly, certain MMPI indices, particularly Scale 4, were found to be relatively stable over time and conditions, reflecting perhaps a basic dispositional pattern or constellation of personality traits.—*Journal abstract.*

1457. Wax, Douglas E. & Haddox, Victor G. (U Michigan, Medical School) **Enuresis, fire setting, and animal cruelty: A useful danger signal in predicting vulnerability of adolescent males to assaultive behavior.** *Child Psychiatry & Human Development*, 1974(Spr), Vol 4(3), 151-156.—Examined 6 institutionalized adolescent male delinquents whose recent history included a triad of behaviors (persistent enuresis, fire setting, and animal cruelty). Not only does the predictive validity of the triad appear to be supported, but the cases cited rank highest among overtly dangerous assaultive youth seen by the Southern California Youth Authority during the 12-mo observation period. A summary of case history data supporting the hypothesis that the triad is a useful clinical tool in the prediction of violent behavior is presented.—E. S. Goodman.

1458. Weis, Sandra & Seiden, Richard H. (U California, Berkeley) **Rescuers and the rescued: A study of suicide prevention center volunteers and clients by means of a death questionnaire.** *Life-Threatening Behavior*, 1974(Sum), Vol 4(2), 118-130.—Administered E. S. Shneidman's questionnaire on demographic characteristics and psychological attitudes toward and experiences with suicide, death, and mental status to 51 suicide prevention center volunteers and 31 suicide attempters. Volunteers were older, better educated, more affluent, more often Protestant and reported greater emotional stability, much less fantasy about suicide, almost no actual suicide attempts, and a tendency not to consider suicide as a justifiable problem-solving option when compared with the suicide attempters. (16 ref)—*Journal abstract.*

1459. Winthrop, Henry. (U South Florida) **The group as a surrogate for the individual.** *Bulletin of the Menninger Clinic*, 1974(May), Vol 38(3), 239-249.—Analyzes in detail 3 forms of contemporary social behavior:

togetherness, conformity, and herd-mindedness. Each of these types of antiautonomous behavior functions chiefly to make the group a surrogate for the individual. The more a society relies on these modes of behavior the more pathological it becomes. When group behavior becomes a chronic surrogate for individual expression, the possibility that the individual will be able to find himself may be wholly lost.—J. Z. Elias.

### Learning Disorders & Mental Retardation

1460. ———. [Papers presented at 3rd Brazilian Congress on Mental Deficiency: June 28–July 2, 1972: II.] (Port) *Revista Brasileira de Deficiência Mental*, 1972(Jun), Vol 8(2), 119 p.—Presents 16 papers on vocabulary training, special educator training, occupational therapy, difficulties in rehabilitation and sex education of the mentally retarded, analysis of aspects of mental deficiency (an analysis of 1,000 cases), Rubenstein's syndrome, Montessori techniques with the retarded, anomalies of sex chromosomes, and related subjects.—N. T. Pinckney.

1461. Alcorn, Dewaine A. (U Nebraska) **Parental views on sexual development and education of the trainable mentally retarded.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 119–130.—Administered to 270 parents of 206 retarded persons a questionnaire on the sexual history of the trainable mentally retarded (TMR) children, attitudes toward sex education, and the possibility of married life for their children. Parents reported little evidence of sexual misbehavior or even interest in sexual matters but generally lacked confidence in their children's future sex behavior. Most believed that they had primary responsibility for sex education, although few felt comfortable about their ability to provide it. Nearly ½ of the parents favored voluntary sterilization of the trainable, but less than 1% of the retardates in the sample had undergone, nor were their parents seriously considering, sterilization. Relationships between the amount of sex information the parents perceived they themselves possessed and their own attitudes toward sex, marriage, and parenthood for the trainable are presented.—*Journal abstract*.

1462. Amado, Fany. (Fonoaudiológico Ctr de Habilidade, São Paulo, Brazil) [Phonaudiology and mental deficiency.] (Port) *Revista Brasileira de Deficiência Mental*, 1972(Mar), Vol 7(1), 19–22.—Describes the types of speech, language, and hearing problems seen in mentally deficient clinic patients. An outline of the development of language to age 7 yrs is given, and the education of the retarded is discussed.

1463. Beange, Helen & Caradus, Verne. (Grosvenor Hosp, Summer Hill, New South Wales, Australia) **The Prader-Willi syndrome.** *Australian Journal of Mental Retardation*, 1974(Mar), Vol 3(1), 9–11.—Observed 15 children with Prader-Willi syndrome who attended an Australian diagnostic and assessment clinic. Ss included 1 child of dull-normal intelligence, 5 mildly retarded children, and others who functioned at the upper part of the moderately retarded range. Some of the characteristics of the disorder, including high-pitched voice, emotional immaturity and obesity, are described, and problems of managing such children are discussed.—*Journal abstract*.

1464. Bucher, Bradley & Bowman, Elizabeth-Ann. (U Western Ontario, London, Canada) **The effects of a discriminative cue and an incompatible activity on generalized imitation.** *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 22–33.—Observed 4 noncompliant male 2–9 yr old retardates in a generalized imitation study. 2 variables were studied: provision of a competing reinforced activity, and use of a cue to aid discrimination between reinforced and nonreinforced imitations. Both variables increased the rate of discrimination between the 2 sets of stimuli. Greatest discrimination occurred when both cue and alternative task were present. Discrimination decreased when the variables were removed. Results imply that imitation of nonreinforced cues in generalized imitation procedures varies with the degree to which reinforcement is available for other activity, as well as with the complexity of the discrimination problem. Results help indicate conditions under which the generalized imitation effect may be observed in more naturalistic settings. (15 ref)—*Journal abstract*.

1465. Buin, Nissan; Rynders, John & Turnure, James. (U Minnesota) **Early maternal linguistic environment of normal and Down's syndrome language-learning children.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 52–58.—Investigated the influence of linguistic data in the maternal environments of 6 Down's syndrome and 5 normal language-learning 24-month-old children. It was found that the Down's syndrome children received a different linguistic input than the "normal" children. The possibility of a relationship between the Down's syndrome children's different early maternal linguistic environment and later characteristics of their deviant-delayed language is considered. Various aspects of language development in general are discussed. (23 ref)—*Journal abstract*.

1466. Busby, Walter A.; Fillmer, H. T. & Smittle, Pat. (U Florida) **Interrelationship between self-concept, visual perception, and reading disabilities.** *Journal of Experimental Education*, 1974(Spr), Vol 42(3), 1–6.—Explored the relationship between self-concept, visual perception, and reading disabilities. Ss were 50 7th- and 50 9th-grade students selected randomly from an integrated and socially balanced senior high school. The Tennessee Self Concept Scale was used as a measure of self-concept; the Spatial Visualization section of the Multiple Aptitude Tests was used as a measure of visual perception; and the paragraph meaning, spelling, and language portions of the Stanford Achievement Test were used as measures of reading disabilities. The 24 variables yielded from the data were submitted to factor analysis and multiple correlation. The hypothesis that self-concept and visual perception are related to reading disabilities was not clearly supported by the data. Further replication is suggested using a measure of "reading" self-concept rather than "general" self-concept. (31 ref)—*Journal abstract*.

1467. Chan, Kenyon S. & Keogh, Barbara K. (U California, Los Angeles) **Interpretation of task interruption and feelings of responsibility for failure.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 175–178.—Administered the Intellectual Achievement Responsibility Questionnaire and a 6-item block design task to 30

educable mentally retarded (EMR) and 30 normally achieving boys (mean chronological age = 148.1 and 101.9 mo, respectively). Ss were matched for mental age. 3 designs were interrupted before completion, with interruption predefined as indicative of success, failure, or neutral. EMRs reported self-blaming reasons for interruption, regardless of the definition of interruption, whereas normal achievers were self-blaming only when interruption was predefined as a failure condition. A relationship was found between Ss' interpretation of interruption and feelings of responsibility for failure. Results suggest that EMR boys are more prone to accept responsibility for failures than for successes, and that self-blaming responses to neutral events such as interruption may be related to depressed educational performance.—*Journal abstract.*

1468. Deich, Ruth F. **Incidental learning and short-range memory in normals and retardates.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 539-542.—Tested and largely confirmed M. R. Denny's hypothesis of an incidental learning deficit in retardates. 18 normal kindergartners and 18 moderately retarded and organically impaired Ss, matched for MA, were given 2 tasks: (a) geometric shapes, requiring sorting according to shape and recalling and recognizing according to color (with color representing incidental learning); and (b) familiar objects, requiring naming the color of common, familiar, pictured objects and recalling and recognizing according to object name (with object name representing incidental learning). Normals showed more incidental learning on the objects task, significantly so for recognition. On the shapes task, retardates gave incorrect responses; normals did not. Thus, retardates learn incidentally but tend to be inferior to normal peers.—*Journal abstract.*

1469. Ennis, Bruce J. & Friedman, Paul R. **Legal rights of the mentally handicapped. Volume 1.** New York, NY: Practising Law Inst, Mental Health Law Project, 1974. 624 p.—Presents the first volume of a legal handbook covering basic facts about mental retardation and mental illness, the civil commitment process, and general rights of the mentally handicapped in mental institutions. Case citations are included, along with transcripts and interpretations of court decisions.

1470. Ennis, Bruce J. & Friedman, Paul R. **Legal rights of the mentally handicapped: Volume 2.** New York, NY: Practising Law Inst, Mental Health Law Project, 1974. 621-1144.—Presents the 2nd volume in a legal handbook on the rights of the mentally handicapped, covering the specific implications of the 1st, 6th, 8th, 13th, and 14th amendments for treatment, the rights of the mentally handicapped in the community, the right to the least restrictive alternative setting for treatment, and the rights of the mentally handicapped in criminal proceedings. Case summaries and interpretations are included.

1471. Ennis, Bruce J. & Friedman, Paul R. **Legal rights of the mentally handicapped: Volume 3.** New York, NY: Practising Law Inst, Mental Health Law Project, 1974. 1143-1538.—Presents the 3rd volume in a legal handbook on the rights of the mentally handicapped, focusing on litigation problems (e.g., jurisdiction, sovereign immunity, attorney's fees, and class

actions). Litigation strategies and techniques are described, and the viewpoints of a judge and an administrator and a summary article on the American Bar Association and the field of mental health are included.

1472. Fast, Irene & Chetnik, Morton. (Children's Psychiatric Hosp, Ann Arbor, MI) **Some aspects of object relationships in borderline Michael.** *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 479-485.—Argues that in borderline children neither self-representations nor object-representations have been integrated into coherent and relatively stable wholes. The child interacts with others largely in terms of his own projection rather than in terms of the other person's actual characteristics. This is seen as a failure to complete the transition out of narcissism into a firm commitment to external reality. Case examples are presented, and the relevant literature is reviewed.—R. S. Albin.

1473. Freire-Maia, Ademar; Freire-Maia, Dertia V. & Morton, Newton E. (Faculdade de Ciências, Médicas e Biológicas, São Paulo, Brazil) **Sex effect on intelligence and mental retardation.** *Behavior Genetics*, 1974(Sep), Vol 4(3), 269-272.—In a sample of 5,049 pairs of individuals from high-risk pedigrees, no evidence could be found for a uterine or socialization maternal effect on IQ or on the incidence of mental retardation. The observed excess of affected males and higher risk for children of affected females were fully consistent with all of 3 multifactorial threshold models.

1474. Friedrich, Douglas; Libkuman, Terry & Hawkins, William F. (Central Michigan U) **Response-stimulus interval performance of nonretarded and institutionalized retarded subjects.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 64-69.—Tested the expectancy and capacity explanations for the consistent finding of a psychological refractory period for nonretarded and retarded Ss. Results are inconsistent with previous dual reaction-time research, showing relative similar reaction times for both intelligence groups. Although the 12 35-yr-old male nonretarded Ss performed better than the 12 40-yr-old retarded Ss under all conditions, both groups indicated a psychological refractory period only at the 250-msec response-stimulus interval under the irregular procedure. Performance under all other conditions indicated that, regardless of presentation procedure, the 1st stimulus (or the 1st stimulus and the reaction to it) established an expectancy for the 2nd stimulus. This expectancy resulted in faster reaction time to the 2nd stimulus than to the 1st.—*Journal abstract.*

1475. Fritz, Janet J. (Colorado State U) **Reversal-shift behavior in children with specific learning disabilities.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 431-438.—Studied discrimination learning by 7-9 yr olds with specific learning disabilities, using the reversal and intradimensional shift paradigms. 3 groups of Ss included 20 normal controls, 20 Ss with learning disability receiving no drug treatment, and 10 Ss with learning disability receiving drug treatment. All groups given the intradimensional shift task performed significantly better than those given the reversal shift task, while the controls performed significantly better on both tasks than Ss with learning disabilities. The prediction

that shift performance by Ss who were receiving drug treatment would be better than that of the nondrug group was not substantiated. Results are discussed in terms of support for the D. Zeaman and B. House attention model of discrimination learning and the effects of drug therapy on attention for children with specific learning disabilities. (15 ref)—*Journal abstract*.

1476. Furby, Lita. (Yale U) **Attentional habituation and mental retardation: A theoretical interpretation of MA and IQ differences in problem solving.** *Human Development*, 1974, Vol 17(2), 118-138.—Offers a theoretical proposal concerning individual differences in cognitive processes. Mental retardation and the comparative problem-solving performance of normal and retarded children are examined. On the basis of W. E. Jeffrey's analysis of attention and cognitive development (1968, 1969), it is proposed that IQ and MA differences in problem-solving behavior reflect differences in (a) speed of orienting-reflex habituation and (b) ability to inhibit responding sufficiently. (51 ref)—*Journal abstract*.

1477. Gupta, S. & Singh, M. V. (Maulana Azad Medical Coll, New Delhi, India) **Marriage and sex education of mental retardates.** *Child Psychiatry Quarterly*, 1973(Jan), Vol 6(1), 15-17.—Discusses past and present practices in India of handling the sexual and reproductive life of mental retardates. Sterilization and segregation were once commonly practiced, but this is not recommended today. The new problems created by this approach are described. Guidelines for decisions about sterilization are presented. An individualistic approach, rather than a general one, is encouraged. Suggestions are made about adjusting the mentally retarded to the community. Recommendations are made for sex and marriage education.—R. S. Albin.

1478. Heilman, Kenneth M.; Watson, Robert T. & Schulman, Howard M. (U Florida, Medical School) **A unilateral memory defect.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Jul), Vol 37(7), 790-793.—Several authors have suggested that arousal is an important component of learning. If the neglect syndrome is a unilateral defect of alerting (arousal) as recent studies have suggested, then patients with this syndrome should have a unilateral learning defect. To test these hypotheses, 8 patients with unilateral neglect were given consonant trigrams randomly to either ear and were asked to identify the auditory stimuli either immediately or after an 18-sec delay, during which time Ss were asked to count. All 8 Ss demonstrated that the number of errors between the delay and nondelay conditions was greater on the neglected side ( $p > .01$ ), thereby supporting these hypotheses. (32 ref)—*Journal abstract*.

1479. Holden, Edward A. & Appelbaum, Anat G. (Edward R. Johnstone Training & Research Ctr, Bordentown, NJ) **Effects of tone alternations on sequential information processed by educable retardates.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1107-1112.—16 educable retardates (mean age = 15.62 yrs; mean IQ = 60.31) reported pulse numerosity in varying length sequences under single- and alternating-tone conditions. It was hypothesized that due to anatomical differentiation greater frequency differences between the alternating tones would result in greater magnitudes of error. Ss made greater errors when

different tones were alternated than when the same tone was presented repetitively, but no significant differences were found between less disparate and more disparate alternating tones. Increases in error by retardates under the alternating tone conditions were predominantly underestimations. (20 ref)—*Journal abstract*.

1480. Hoyer, Frances W. & Cone, John D. (Hutchings Psychiatric Ctr, Syracuse, NY) **Child performance as a determinant of elderly caretaker behavior.** *Journal of Gerontology*, 1974(Sep), Vol 29(5), 534-542.—24 elderly female caretakers were observed interacting with their retarded foster grandchildren and were classified as permissive or restrictive according to frequency of commands during a 15-min structured play pretreatment assessment. Subsequently, each of the 24 caretaker-child pairs participated in a 10-min experimental task under 1 of 3 false feedback conditions concerning child performance on eye-hand coordination tests: correct, incorrect, or no feedback. A 15-min posttreatment assessment followed the task immediately, and pre-post comparisons were made on 5 behavior classes for both caretaker styles. For caretaker commands, a significant Caretaking Style  $\times$  Occasion interaction was obtained; permissive caretaker command frequencies remained stable from pre- to posttreatment, while restrictive caretaker command frequencies decreased markedly. There were no significant differential effects of the false feedback conditions for any behavior category. The failure to obtain specific treatment effects may be related to the operational definition of correctness used and to characteristics of the sample (e.g., caretaker age, caretaker cohort, and child ability level).—*Journal abstract*.

1481. Jackson, Erwin D. & Jackson, Roger L. (Western Illinois U) **Distribution of rewards by mentally retarded individuals in a cost and no-cost situation.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 77-82.—Examined how 50 male institutionalized severely mentally retarded adults divided rewards when they were placed in a cost and no-cost situation. The additional information of the amount of work completed by each member of the dyad was furnished. Ss at 3 different mental-age levels divided rewards in proportion to each member's work input. This style of distribution was used when rewards were divided between both themselves and a fictitious partner (cost) and between 2 other absent (actually fictitious) individuals (no cost). Results firmly support predictions made from equity theory.—*Journal abstract*.

1482. Jordan, John E.; Adis-Castro, Gonzalo & Zúñiga, Evenor. (Michigan State U) **[Construction of a crosscultural scale of attitude behaviors toward the mentally retarded on the basis of Guttman's facet theory.]** (Span) *Revista Interamericana de Psicología*, 1974, Vol 8(1-2), 1-24.—Constructed the Attitude-Behavior Scale: Mental Retardation (ABS-MR), a 5-facet, 6-level instrument based on Guttman's facet theory, to assess attitudes toward the mentally retarded. Attitude was defined as a "delimited totality of behavior with respect to something," each of the 6 levels or subscales of ABS-MR corresponding to 1 attitude so defined. For the purposes of test validation, ABS-MR was administered to 3 groups already known to differ with respect to attitudes toward the mentally retarded: primary school

teachers of British Honduras, candidates for an American MA degree in rehabilitation, and American students of education. Results support the utility of the facet-theory approach and the hypothesis of invariate cross-cultural structure of certain aspects of attitudes. Attitude behaviors were found to range from a cognitive-other-passive orientation to an affective-self-action orientation. (English summary) (61 ref)—*S. Slak*.

1483. Kryniski, Stanislaw, et al. (Ctr de Habilitação do APAE, São Paulo, Brazil) [The meowing cat syndrome: A multidisciplinary study of a case.] (Port) *Revista Brasileira de Deficiência Mental*, 1972(Mar), Vol 7(1), 23-34.—Examines the case of a severely retarded 8-yr-old boy from the psychiatric, physiological, genetic, and biological points of view. A detailed profile of this S is compared to 7 others exhibiting the meowing cat vocalization and to various scales of retardation. Specific criteria for diagnosing this syndrome are considered. (24 ref)—*N. T. Pinckney*.

1484. Lauten, Max H. & Birnbrauer, J. S. (U North Carolina, Chapel Hill) The efficacy of "right" as a function of its relationship with reinforcement. *Journal of Experimental Child Psychology*, 1974(Aug), Vol 18(1), 159-166.—Tested the effects of the relationship between the presentation of a verbal stimulus ("right") and an established reinforcer (candy) on the reinforcement efficacy of the verbal stimulus with 3 groups of 20 8-20 yr old retarded boys. Blocks of training and test trials alternated. During training of the discriminative group, "right" reliably preceded candy, and for the random group "right" and candy were programed independently. "Right" promoted learning in the discriminative group but did not in the latter 2 groups. Results support R. B. Cairns's analysis of the often found failure of approval to be an effective reinforcer in laboratory tests.—*Journal abstract*.

1485. Lei, Tzu-en-jen; Butler, Edgar W.; Rowitz, Louis & McAllister, Ronald J. (Neuropsychiatric Inst—Pacific State Hosp Research Group, Los Angeles, CA) Agency-labeled mentally retarded persons in a metropolitan area: An ecological study. *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 22-31.—Study results indicate that persons labeled mentally retarded by public agencies were predominantly the poor and/or ethnic minorities who lived in areas of deteriorated and older housing. Persons labeled mentally retarded by private clinical agencies were predominantly Anglo, middle- and upper-class, and resided in areas of better housing and neighborhood quality. (17 ref)

1486. Maksud, Michael G. & Hamilton, Lyle H. (U Wisconsin, Milwaukee) Physiological responses of EMR children to strenuous exercise. *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 32-38.—A battery of physiological tests administered to 62 10-13 yr old black and white educable mentally retarded boys resulted in no statistically significant physiological differences between the 2 racial groups. The maximal oxygen uptake for Ss appeared to be lower than data reported for nonretarded children; some rationale for this lower aerobic power is discussed. (24 ref)

1487. Miezieski, Charles M. (Rutgers State U, New Brunswick) Effect of white noise on the reaction time of mentally retarded subjects. *American Journal of Mental*

*Deficiency*, 1974(Jul), Vol 79(1), 39-43.—2 family retarded groups, a Down's syndrome group, and a nonretarded group (6 male and 6 female 17-19 yr olds in each) performed a simple visual reaction time (RT) task during white noise and no noise. It was predicted that via its arousing properties white noise would cause a decrease in RT for the family retarded group and an increase for the Down's syndrome Ss. The Down's syndrome group had slower RTs during white noise than no noise, whereas the other groups showed no differences. Data provide partial confirmation of an arousal hypothesis of mental retardation which, with respect to nonretarded persons, considers family retarded persons in a state of low arousal and Down's syndrome retarded persons in a state of high arousal. (17 ref)—*Journal abstract*.

1488. Moran, P. A. (Australian National U, Inst of Advanced Studies, Canberra, ACT) Are there two maternal age groups in Down's syndrome? *British Journal of Psychiatry*, 1974(May), Vol 124, 453-455.—While it has been shown that the age of mothers of Down's patients shows bitangentiality and occasionally bimodality, it does not necessarily follow that different causes are operating in the manner postulated by Penrose and Smith (1966). Older mothers have a higher rate of producing mongoloids, but further research is needed to decide whether there are 2 groups of causal factors or whether there may be some biochemical change that accelerates rapidly after the age of 30.—*R. L. Sulzer*.

1489. Mulhern, Thomas. (Albert P. Brewer Developmental Ctr, Mobile, AL) The problem oriented approach in clinics for the mentally retarded. *Training School Bulletin*, 1974(May), Vol 71(1), 49-51.—Presents a general description Ctr, Mobile, AL approach to medical records and endorses its application to the clinical records, IQ assignment, and consignment to institutions of the mentally retarded. This method is considered a means of further establishing the individual identity of clients and of insuring the appropriate attention to their particular difficulties.—*Journal abstract*.

1490. Neal, W. R. (U Georgia, Coll of Education) Verbal auditory screening with the educable mentally retarded. *Training School Bulletin*, 1974(May), Vol 71(1), 62-66.—Investigated the efficiency of the Verbal Auditory Screening for Children (VASC) compared to a pure-tone threshold test as a technique to identify hearing impairment among 97 6-15 yr old educable mentally retarded children. The VASC correctly identified 72.2% of the total Ss. Of the 36 Ss failed by the pure-tone threshold test, 75% were missed by the VASC. It is concluded that the VASC technique cannot identify all cases of hearing loss identified by a pure-tone threshold test when used with educable mentally retarded children.

1491. Peters, Edward N.; Pumphrey, Muriel W. & Flax, Norman. (New York State Dept of Mental Hygiene, Rochester) Comparison of retarded and nonretarded children on the dimensions of behavior in recreation groups. *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 87-94.—Placed 70 6-17 yr old educable mentally retarded (EMR) children in adult-led recreation groups of nonretarded children at a community center over a 4-yr period to investigate the extent to

which EMR children can participate in such groups. The 2 dimensions usually found in studies of child behavior were descriptive of the behavior of both the EMR and the nonretarded children. The EMR children scored lower on the dimension of Interest-Participation vs Apathy-Withdrawal than did the nonretarded children, but with some overlap of the distributions. No difference was found between EMR and other children on the dimension of Cooperation-Compliance vs Anger-Defiance. Individual differences in behavior of the EMR children on these dimensions were, in part, predictable and consistent over groups.—*Journal abstract.*

1492. Preston, Malcolm S.; Guthrie, John T. & Childs, Barton. (John F. Kennedy Inst, Baltimore, MD) **Visual evoked responses (VERs) in normal and disabled readers.** *Psychophysiology*, 1974(Jul), Vol 11(4), 452-457.—Investigated the possibility that reading disabled children exhibit abnormal visual evoked responses (VERs). Comparisons were made between a group of 9 9-yr-old disabled children and 2 control groups of 9 normal children each, one group matched on age and IQ, and the other on reading level and IQ. VERs were obtained for flashes of light and word stimuli. Results indicate that the reading disabled Ss showed a significantly smaller amplitude in the negative wave at 180 msec following stimulus onset, for an electrode placed in the region of the left angular gyrus, compared to the 2 control groups. All 3 groups showed significantly greater negative amplitudes at this latency for the word stimulus compared to the light flash. Results confirm earlier findings and suggest that a neurological origin of reading disability is likely.—*Journal abstract.*

1493. Rubin, Kenneth H. & Orr, R. Robert. (U Waterloo, Ontario, Canada) **Spatial egocentrism in nonretarded and retarded children.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 95-97.—Examined the relation of chronological (CA) and mental (MA) ages to 2 spatial egocentrism tasks by comparing the performance of MA-matched nonretarded and retarded children, and CA-matched nonretarded and retarded children. 28 2nd graders, 30 6th graders, and 20 retarded children participated. Retarded children performed similarly to nonretarded Ss of the same MA but inferior to their nonretarded CA peers.—*Journal abstract.*

1494. San Martino, Mary & Newman, Morton B. (Mystic Valley Mental Health Ctr, Lexington, MA) **Siblings of retarded children: A population at risk.** *Child Psychiatry & Human Development*, 1974(Spr), Vol 4(3), 168-177.—Discusses guilt as a major factor underlying the symptoms of siblings of retarded children. The process of reparation is viewed as essential to the alleviation of guilt and anxiety and the assessment of the reparation efforts in diagnosis. Parental reaction to a retarded child is important as siblings develop fantasies and behavior as defenses against guilt and anxiety. 4 cases are presented to illustrate the ways families may deal with a retarded child.—*E. S. Goodman.*

1495. Silverman, Wayne P. (New York State Inst for Research in Mental Retardation, Staten Island) **High speed scanning of nonalphanumeric symbols in cultural-familially retarded and nonretarded children.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 44-51.—Administered a task similar to that of S.

Sternberg (see PA, Vol 40:10810) to 36 2nd, 5th, and 8th graders and 12 retarded Ss (mean mental ages—MAs—9.9 yrs) with meaningless letter-like figures as the stimuli. Results show that performance increased with age for the nonretarded Ss. The retarded Ss performed above the level expected of their MA-matched nonretarded peers but below the level expected of nonretarded children of equal chronological age. Differences in group performance were due to "intercept" rather than "slope" differences in all instances. (16 ref)—*Journal abstract.*

1496. Sorel, F. M. (Mental Health Organization, Limburg, Netherlands) **Prevalences of mental retardation.** Tilburg, Netherlands: Tilburg U Press, 1974, vi, 148 p.—Discusses a specific study into the prevalence of mental retardation in Amsterdam, and presents a comparative, methodological analysis of 5 Dutch prevalence-studies and 12 studies from other countries. (5 p ref)

1497. Sperber, Richard D. (U. Connecticut) **Developmental changes in effects of spacing of trials in retardate discrimination learning and memory.** *Journal of Experimental Psychology*, 1974(Aug), Vol. 103(2), 204-210.—3-trial form discrimination problems were presented concurrently to 28 educable retardates (mean age = 18 yrs). The spacing interval separating Trials 1 and 2 was filled with either zero of 4 interpolated trials, while retention intervals between Trials 2 and 3 were zero interpolated trials, 8 interpolated trials, or 24 hr in length. Performance on all within-day retention tests was superior following massed presentations of Trials 1 and 2. Performance on test trials following 24-hr retention intervals showed a developmental trend; while a spacing interval facilitated long-term learning in more intelligent retardates (mental age > 7-8 yrs), the same interval proved detrimental to long-term learning in less intelligent retardates. Findings are discussed in reference to R. D. Sperber, D. B. Greenfield, and B. J. House's (1973) Markovian spacing model. The observed developmental change in the effects of spaced practice is interpreted as evidence that resistance to coding loss increases with intelligence.—*Journal abstract.*

1498. Stayton, Samuel E. & Ohwaki, Sonoko. (Oak Hill Youth Ctr, Laurel, MD) **Retardates' memory for contextually related words.** *Training School Bulletin*, 1974(May), Vol 71(1), 30-38.—Required 20 moderately and severely retarded Ss, with a mean chronological age of 25.2 yrs and a mean mental age of 6.2 yrs, to memorize a 20-word list composed of 4 categories, 5 words in each category. 2 categories contained words related to either an action or spatial context. The mean recall of these contextually related words was significantly greater than those in the remaining categories, which were words belonging to general classes. There was no evidence for facilitative effects of presenting words within the same category successively rather than randomly in the list of words to be recalled, which has been reported by previous researchers.—*Journal abstract.*

1499. VanderVeer, Beverly & Schweid, Edda. (U Washington) **Infant assessment: Stability of mental functioning in young retarded children.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 1-4.—Administered the Bayley Scales of Infant Develop-

ment to 23 18-30 mo old patients suspected of being mentally retarded. Between 1 and 3 yrs later, these Ss were reevaluated using either the Bayley Scales of Infant Development or the Stanford-Binet Intelligence Scale. Of the 15 Ss initially found to be in the moderately-to-profoundly retarded range, 73% remained in that category at follow-up. None of the Ss initially functioning in any of the retarded ranges were normal at follow-up. Results are discussed in terms of the utility of the Bayley Scales of Infant Development in diagnosing mental retardation and the resistance to change of impaired intellectual ability. (18 ref)—*Journal abstract*.

1500. Weaver, Lelon A. & Ravaris, Charles L. (U Vermont) **Psychomotor test scores and rated functional impairment of mental retardates.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 487-490.—Administered a battery of 5 psychomotor tests to 258 retardates. Test results were used to assign Ss to mildly or moderately retarded categories. Comparison with the "functional" classification used by the training school showed agreement in  $\frac{1}{4}$  of the cases. Implications for clinical use and for mental dysfunction are discussed.—*Journal abstract*.

1501. Wiig, Elisabeth H. & Semel, Eleanor M. (Boston U) **Logico-grammatical sentence comprehension by adolescents with learning disabilities.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1331-1334.—Evaluated the comprehension of 50 logico-grammatical sentences by 30 12-16 yr old learning disabled adolescents. Performances were compared with data for normal age peers. Learning-disabled Ss exhibited quantitative reductions in comprehension. There were significant intercorrelations between performance and certain subtests of the Stanford Achievement Test and between age scores for the Psycholinguistic Age and Auditory Association and Auditory Association and Auditory Sequential Memory subtests of the Illinois Test of Psycholinguistic Abilities.—*Journal abstract*.

1502. Wilks, John & Wilks, Eileen. (Pembroke Coll, Oxford, England) **Bernard: Bringing up our mongol son.** London, England: Routledge & Kegan Paul, 1974. xv, 160 p.—Presents a detailed story, illustrated with photographs, of the development of physical and mental skills in a mongoloid boy from birth through his 14th yr. (7 p ref)

1503. Winters, John J.; Attlee, Leonard C. & Harvey, Frank. (Edward R. Johnstone Training & Research Ctr, Bordentown, NJ) **Paired-associate learning of EMR adolescents and nonretarded children as a function of methods of presentation and training.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 70-76.—32 nonretarded children and 64 noninstitutionalized and institutionalized retarded adolescents of equal mental age (7.9 yrs) learned an 8-pair list of pictures of common objects by the method of anticipation or the study-test method with or without training on each method. Overall, the study-test method was superior to the anticipation method for the 3 groups, and the hierarchy of efficient performance was nonretarded children, noninstitutionalized, and then institutionalized retarded adolescents. Preceiling analyses indicated that training was influential, but only with the institutionalized group. Differences in performance between methods are dis-

cussed in terms of relative confusability of the methods; differences among groups are attributed to the influence of training prior to ceiling performance and to differential verbal experiences prior to testing. (21 ref)—*Journal abstract*.

1504. Wolfensberger, Wolf & Kurtz, Richard A. (Syracuse U) **Use of retardation-related diagnostic and descriptive labels by parents of retarded children.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 131-142.—105 parents of retarded children completed checklists containing 57 terms used to describe mentally retarded persons, to assess their familiarity with and their reactions to these labels. Data suggest that parents have considerable difficulty in accepting any label for their own children, even terms which are relatively free of negative imagery. While practically all parents were familiar with the term "mental retardation," and while 93% indicated that the term is appropriate for the retarded in general, only 42% thought it appropriate for their own children. Findings also indicate that 2 forces operate in influencing parental reactions to retardation-related terms: the social desirability of a given term and the context in which the parents are asked to judge a label. Contrasting results from previous studies are discussed, and implications for counseling are examined. (43 ref)—*L. Gorsev*.

1505. Zachofsky, Toni; Reardon, Diane & O'Connor, Gail. (Neuropsychiatric Inst—Pacific State Hosp Research Group, Los Angeles, CA) **Response of institutionalized retarded adults to social pressure in small groups.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 10-15.—Studied responses to group pressure as related to sex and IQ of S and presence of an authority figure. Each member of 6 male and 6 female (IQ = 20-80; age = 20-50 yrs) 3-person groups was asked to report simple position judgments. Stimuli that the S member saw were inconspicuously shifted to conflict with the group's report. Results indicate (a) that IQ significantly affected yielding to group judgment, with lower IQ Ss yielding more often; and (b) that although neither sex of S nor presence of an authority figure affected yielding behavior significantly, males tended to yield more often than females. The relationship of IQ to the motivational variables of social reinforcement and achievement is discussed. (26 ref)—*Journal abstract*.

### Speech Disorders

1506. Heriot, James T.; Tavormina, Joseph B. & Vautrain, Robert L. (U Rochester, School of Medicine & Dentistry) **Correction factor for the PPVT as a reading test.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1098.—Presents a correction factor derived from regression analysis for using the Peabody Picture Vocabulary Test (PPVT) as a reading test. New correlations between the PPVT and the Wide Range Achievement Test are presented, and the usefulness of this modified PPVT as a substitute measure of oral reading for persons with expressive speech handicaps is noted.

1507. Kuper, Eolin C. (Johns Hopkins Hosp, Hearing & Speech Ctr, Baltimore, MD) **Speech training through musical ear-training for pitch deficient children having**

**articulatory defects.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 168-172.—Investigated whether training in musical interval recognition and rhythm can lead to improved articulation in speech-defective children. 19 8-13 yr old Ss, with articulation defects ranging from mild to severe, were matched for IQ and for pitch discrimination ability using the Kwalwasser-Dykema Tests of Musical Talent. Half of the Ss (experimental group) received musical training for 3 wks followed by 3 wks of standard speech-correction training. The remaining Ss (control group) received speech-correction training for the entire 6 wks. Speech was rated before and after training by having Ss read a standardized 175-word story. Both groups showed some improvement in speech articulation following training, and the equality of effects suggests that the musical training may have had as beneficial an effect on articulation as actual speech-correction training.—*M. B. Meikle.*

1508. **Okasha, Ahmed et al.** (Ain Shams U Hosp, Cairo, Egypt) **Electroencephalographic study of stammering.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 534-535.—Reports EEG data obtained from 54 6-12 yr old stammerers and 27 controls. Data suggest that neurological immaturity, low IQ, nonspecific EEG changes, and stammering are all part of a faulty developmental process which may be constitutionally determined but which are reinforced by environmental factors.

1509. **Okasha, Ahmed; Bishry, Z.; Kamel, M. & Hassan, A. H.** (Ain Shams U Hosp, Cairo, Egypt) **Psychosocial study of stammering in Egyptian children.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 531-533.—Obtained family history, neurological, personality, IQ, and verbal fluency data from 8,459 6-12 yr old Egyptian children, of whom 79 were stammerers. Results show that (a) the greatest number of stammerers were found in the 6-7 and 11-12 yr old groups, (b) at all ages there were more male than female stammerers, (c) emotional and physical precipitating factors were found in 18 cases, and (d) developmental delays were more common among stammerers than nonstammerers.

1510. **Rider, Barbara A.** (VA Hosp, Topeka, KS) **Abnormal postural reflexes in dysphasic children.** *American Journal of Occupational Therapy*, 1974(Jul), Vol 28(6), 351-353.—Tested the postural reflexes of 20 5-7 yr old children. The experimental Ss were 12 boys and 3 girls enrolled in speech therapy classes. No Ss with established neurological deficits or with observable motor problems were included in the study. The control group consisted of 4 boys and 1 girl with no speech defects. All Ss were enrolled in public schools. It was found that dysphasic Ss demonstrated significantly more abnormal reflex responses than nondysphasic Ss. 5 of the 15 dysphasic Ss were being treated for articulation problems only, while 10 were being treated for language disorders in addition to articulation problems. Ss who demonstrated language disorders had significantly more abnormal reflex responses than Ss who had only articulation problems. (16 ref)—*Journal abstract.*

1511. **Silverman, Ellen-Marie; Zimmer, Catherine H. & Silverman, Franklin H.** (Marquette U) **Variability of stutterers' speech disfluency: The menstrual cycle.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2),

1037-1038.—Studied whether women who stutter produce more speech disfluencies at premenstruation (when anxiety level has been reported highest) than at ovulation (when anxiety level has been reported lowest). 4 speech samples were collected from each of 4 Ss, one at ovulation and one at premenstruation for 2 consecutive cycles. Results show that Ss produced more disfluencies premenstrually.

### Physical & Toxic Disorders

1512. ———. **Coronary artery bypass operation: Psychological and medical problems.** *International Journal of Psychiatry in Medicine*, 1974(Win), Vol 5(1), 67-80.—Discusses relevant data and an interview with a patient who had undergone 2 coronary artery bypass procedures, with respect to his adaptation to the operation and his illness. The rehabilitation program is described.

1513. **Allen, David C.** (U. Houston, School of Optometry) **Vertical prism adaptation in anisometropes.** *American Journal of Optometry & Physiological Optics*, 1974(Apr), Vol. 51(4), 252-259.—To explore the phenomenon of prism adaptation, 20 anisometropic Ss with good binocular vision were examined at the reading level for the presence or absence of compensation to their induced vertical imbalance. Results show that the compensation was approximately equal to the prismatic imbalance and that there appeared to be a tendency for the compensation to lag behind the amount of prism generated for higher induced prism values. (21 ref)—*Journal abstract.*

1514. **Altamura, A. C. & Giordano, P. L.** (U Milan, Inst of Psychiatric Clinic, Italy) **[Neurochemical, immunological and ultrastructural aspects of experimental epilepsy: Critical review of actual data.]** (Ital) *Acta Neurologica*, 1974(Jan), Vol 29(1), 13-32.—Reviews the recent literature, pointing out especially that in considering the etiopathology of epilepsy as suggested by various experimental models, it is important to take into account the "dynamic" interaction among different pathological brain modifications. Such dynamic considerations do not exclude the existence of a main etiopathological event in the development of epileptic discharge, but it appears to be more important for the maintenance of electroclinical patterns of epilepsy. (110 ref)—*Journal summary.*

1515. **Aronow, Wilbert S. & Cassidy, John.** (VA Hosp, Cardiology Section, Long Beach, CA) **Effect of marihuana and placebo-marihuana smoking on angina pectoris.** *New England Journal of Medicine*, 1974(Jul), Vol 291(2), 65-67.—Evaluated the effect of smoking marihuana vs placebo marihuana on cardiovascular function and on exercise-induced angina in 10 patients with angina pectoris. With the S resting, smoking 1 marihuana cigarette (.05 mg of  $\Delta^9$ -tetrahydrocannabinol) increased the product of systolic blood pressure times heart rate and venous carboxyhemoglobin level and decreased the exercise time until angina 48%. Smoking 1 placebo marihuana cigarette increased the venous carboxyhemoglobin level, did not affect the product of systolic blood pressure times heart rate of resting Ss, and decreased the exercise time until angina 8.6%. Smoking marihuana significantly decreased the exercise time until angina more than smoking placebo marihuana ( $p < .001$ ).

Smoking marihuana probably increases the myocardial oxygen demand and decreases myocardial oxygen delivery, causing patients with angina to experience angina after exercise sooner, and with less work.—*Journal abstract.*

1516. **Aston, Carletta H.** (Mt Camel Guild, Hearing & Speech Diagnostic Ctr, Newark, NJ) **Hearing-impaired children's discrimination of filtered speech.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 162-167.—Tested the possibility that hearing-impaired children can learn to make compensatory use of durational and low-frequency cues in discrimination of phonemes. 10 severely hearing-impaired Ss (age 9-14 yrs) listened to taped lists of nonsense syllables (12 minimal pairs combined with /i/ or /a/). Half of the tapes were filtered to suppress frequencies above 700 Hz. Stimuli were presented at the most comfortable listening level (range, 108-126 db). Ss were given a form and instructed to circle the syllable they thought they heard. Tests for discrimination of filtered and unfiltered stimuli were given before and after training on 2 consecutive days. Training consisted of the same types of stimulus presentation, except that Ss were informed when their responses were correct. Results were analyzed in terms of Ss' ability to use place of articulation, manner of articulation, and presence or absence of nasality as discriminatory cues. Ss showed significant learning effects when minimal pairs involved differences in manner of articulation and presence or absence of nasality, but none when pairs differed only in place of articulation. Although all Ss could distinguish between the filtered and unfiltered speech, there was no difference in learning between the 2 conditions.—*M. B. Meikle.*

1517. **Azzi, Enzo.** (Santa Casa, School of Medical Sciences, São Paulo, Brazil) **[Occurrence of coronary disease: Psychological and sociocultural factors.]** (Port) *Revista de Psicologia Normal e Patológica*, 1970(Jul), Vol 16(3-4), 272-288.—Stresses that psychological factors and social conditions, as well as the physiological components usually considered, are important in coronary disease. Psychological stress, social stress, and the "coronary-prone" personality are discussed. (36 ref)—*N. T. Pinckney.*

1518. **Bartle, Stuart H. & Bishop, Louis F.** (Mount Sinai School of Medicine, City U New York) **Psychological study of patients with coronary heart disease with unexpectedly long survival and high level function.** *Psychosomatics*, 1974, Vol 15(2), 68-69.—Administered the Minnesota Multiphasic Personality Inventory (MMPI) to 18 patients with coronary heart disease who had unexpectedly survived long, despite grave prognosis, and a high level of function satisfactory to them. No elevation in various scales of MMPI was found. Denial was not seen.—*Journal abstract.*

1519. **Benton, Arthur L.; Levin, Harvey S. & Van Allen, Maurice W.** (U Iowa, Neurosensory Ctr) **Geographic orientation in patients with unilateral cerebral disease.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 183-191.—Studied the accuracy of geographic orientation in 50 patients with unilateral cerebral disease and 84 control patients without brain damage. The influence of educational background on performance

was also assessed. When educational background was controlled, the patients with brain disease performed more poorly than the controls on tasks requiring the localization of states and cities on a map of the US and on a verbal test requiring them to indicate the directional relations between places. Educational background showed both an overall influence on performance level and an interaction with diagnostic category, the less well educated patients with brain disease showing a larger difference from their controls than patients with better education. A "vector" score, reflecting a shift in localization toward the left or right part of the map, differentiated between patients with right and left hemisphere disease and suggested neglect of the visual field contralateral to the side of lesion in some of these patients. The relationship between directional bias in geographic orientation and unilateral neglect in simpler spatial localization tasks remains an open question. (French & German summaries)—*Journal abstract.*

1520. **Bergener, M.; Gerhard, L. & Husser, J.** (U. Düsseldorf, Psychiatric Clinic, W. Germany) **[Clinical and morphological investigations on familial old age hallucinosis.]** (Germ) *Nervenarzt*, 1972(Jan), Vol. 43(1), 18-33.—Discusses organic, endogenous, and multifactor origins of old age psychoses and possible connections between morphological findings and hallucinatory symptoms. A familial senile hallucinosis observed in 6 siblings of a family—3 with a fully developed disease, 2 with abortive symptoms, and 1 clinically healthy—is described, and the morphological findings on 2 of the 3 diseased Ss are presented and analyzed. (71 ref)—*T. Fisher.*

1521. **Berlá, Edward P.** (American Printing House for the Blind, Louisville, KY) **Tactual orientation performance of blind children in different grade levels.** *American Foundation for the Blind, Research Bulletin*, 1974(Apr), Vol 27, 1-10.—Investigated the effects of stimulus complexity (3-, 4-, and 5-sided figures) and degree of rotation (90°, 180°, 270°) on tactual figural orientation performance, with 72 blind children in grades 2, 4, 6, and 8 as Ss. The overall performance was poor, but Ss in all grade levels were able to orient tactual figures at above-chance levels, and accuracy rose significantly as grade level increased. Complexity and degree of rotation had no effect on accuracy, but increasing complexity significantly increased task time. Differences in tactual search patterns appeared to be responsible for the differences in accuracy across grades. (15 ref)—*Journal abstract.*

1522. **Bethell, Martin F.** (South Western Regional Health Authority, Bristol, England) **A rare manifestation of fetishism.** *Archives of Sexual Behavior*, 1974(May), Vol 3(3), 301-302.—Presents a brief case report of a 20-yr-old male who exhibited infantile sexual behavior (e.g., dressing in a diaper, wearing a female wig, and sucking a bottle) associated with known brain damage. The patient suffered a right hemiplegia, caused by polyarteritis nodosa, at age 5, and had received steroid therapy from age 5-15.

1523. **Black, F. William.** (Fitzsimons Army Medical Ctr, Psychology Service, Denver, CO) **Cognitive effects of unilateral brain lesions secondary to penetrating missile wounds.** *Perceptual & Motor Skills*, 1974(Apr),

Vol 38(2), 387-391.—Examined the WAIS verbal and nonverbal subtest performance of 60 Ss with unilateral brain lesions secondary to penetrating missile wounds and compared it with that of 30 normal controls. The performance of matched right- and left-hemisphere lesioned Ss differed significantly on only 2 verbal measures and 1 nonverbal; however, all performance differences were in the direction hypothesized. The performance of right-hemisphere lesion and control Ss differed significantly on all measures, with consistently lower scores by brain-injured Ss, while the performance of left-hemisphere and control Ss differed significantly on the 3 verbal measures and WAIS Full Scale IQ. These results are in general agreement with previous reports using a similar research design and tend to support the hypothesis of differential impairment of verbal and nonverbal test performance in Ss with unilateral brain lesions.—*Journal abstract*.

1524. Blegvad, B. (State Hearing Ctr, U Hosp, Odense, Denmark) **Contralateral masking effect after transection of the efferent fibers to the cochlea.** *Scandinavian Audiology*, 1972(Sep), Vol 1(3), 115-118.—Examined the contralateral masking effect in a 55-yr-old female patient in whom, in all probability, the efferent fibers to the right cochlea had been severed. Masking of the left ear with white noise was found to influence the Békésy threshold curves obtained from the operated ear; a reduction of the tracing width was noted. The finding suggests that the effect of unilateral noise stimulation is due to central mechanisms rather than to an influence on the opposite cochlea, and that the anatomical substrate for a diminished tracing amplitude is not to be sought exclusively within the peripheral sense organ. (Danish summary)—*Journal abstract*.

1525. Boll, Thomas J. (U Virginia, Medical Ctr, Div of Child & Adolescent Psychiatry) **Right and left cerebral hemisphere damage and tactile perception: Performance of the ipsilateral and contralateral sides of the body.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 235-238.—60 patients with lateralized brain lesions were compared with respect to contralateral and ipsilateral tactile-perceptual difficulty as well as overall performance on such tasks. Results show that Ss with right hemisphere brain damage were more impaired on the contralateral and ipsilateral sides of the body than were Ss with lesions of the left hemisphere. Total errors were also greater in the right than in the left brain-damaged group. Findings suggest the right hemisphere is preeminent in subserving tactile perception on both sides of the body. (French & German summaries)—*Journal abstract*.

1526. Brooks, D. Neil. (Glasgow U, Southern General Hosp, Scotland) **Recognition memory, and head injury.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Jul), Vol 37(7), 794-801.—Tested 34 severely head-injured adults on a recognition memory procedure involving the identification of 8 recurring shapes among a series of 160. Compared with a control group of 34 orthopedic outpatients, the tested patients showed many fewer correct responses. Their type of error was commonly a failure to recognize rather than a false recognition. The severity of the memory deficit was related to the length of posttraumatic amnesia (PTA) but not to the presence of neurological signs at the time of

memory testing or to the time after injury at which the patients were tested. The older patients showed a more significant relationship between PTA and memory score than the younger patients.—*Journal abstract*.

1527. Browne, Thomas R.; Penry, J. Kiffin; Porter, Roger J. & Dreifuss, Fritz E. (NIH, Bethesda, MD) **Responsiveness before, during, and after spike-wave paroxysms.** *Neurology*, 1974(Jul), Vol 24(7), 659-665.—In 26 5-20 yr old patients with absence seizures, 413 auditory reaction times were determined by a paroxysm detection device during 310 spike-wave paroxysms. All reaction times during the 1 sec before a paroxysm were within normal limits, but only 43% of reaction times at the onset of a paroxysm were normal, and after a delay of .5 sec into a paroxysm, only 20% were normal. After 4 sec of spike-wave discharge, 52% of reaction times were normal. Responsiveness was recovered quickly after a paroxysm. The degree of impairment of response to auditory stimuli markedly decreased when spike-wave discharge was fully generalized. The degree of maximal impairment of auditory responsiveness was the same in paroxysms of both long and short duration. Thus, any spike-wave paroxysm, regardless of duration, can impair consciousness, and therapy for absence seizures should aim at controlling all spike-wave paroxysms.—*Journal abstract*.

1528. Chen, Kathleen. (Rochester Inst of Technology) **Free recall learning of deaf and hearing subjects.** *Journal of General Psychology*, 1974(Jul), Vol 91(1), 155-156.—Found that normal-hearing Ss were superior to profoundly deaf Ss in learning free-recall lists of trigrams. The performance of Ss with lesser hearing loss was comparable to that of normal Ss. Differential performance depended on the level of trigram pronunciability, supporting the role of frequency of previous auditory experience in learning.

1529. Coet, Larry & Tindall, Robert C. (U Wyoming) **Definition of "handicap" as a function of age and sex.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1197-1192.—Male and female 17-81 yr old Ss ranked the 3 groups of people they felt would be labeled handicapped. Group differences were not significant but some sex and age differences on particular handicaps were marked. Results suggest that definitions of "handicap" may reflect societal values and age and sex of the person making the judgment.

1530. Cull, John G. & Hardy, Richard E. (Virginia Commonwealth U) **Language meaning (gender shaping) among blind and sighted students.** *American Foundation for the Blind, Research Bulletin*, 1974(Apr), Vol 27, 275-276.—Administered the gender Association Survey to 22 blind and 64 sighted Ss. The groups differed significantly in assigning gender to 17 of 50 commonly used words.

1531. Daly, Richard F. & Matthews, Charles G. (U Wisconsin Hosp, Ctr for Health Sciences, Madison) **Impaired motor function in XYY males.** *Neurology*, 1974(Jul), Vol 24(7), 655-658.—10 13-56 yr old XYY males, most of whom are or have been in prison, showed a high frequency of hand tremor. Quantitative testing with a battery of coordination and steadiness tasks of 6 of these Ss showed impaired performance when compared with that of controls. These and previous data

suggest that XYY men in penal or mental institutions typically have impaired motor function. Socially unacceptable behavior may be another manifestation of their impaired brain function. Unexplained hand tremor in males is an indication for chromosome analysis.—*Journal abstract.*

1532. Davis, Floyd A.; Michael, Joel A. & Tomaszewski, Jerome S. (Rush-Presbyterian—St Luke's Medical Ctr, Chicago, IL) **Fluctuation of motor function in multiple sclerosis related to circadian temperature variations.** *Diseases of the Nervous System*, 1973(Jan), Vol 34(1), 33-36.

1533. Eliasson, Sven G.; Prenskey, Arthur L. & Hardin, William B. (Washington U) **Neurological pathophysiology.** New York, NY: Oxford University Press, 1974. xiii, 397 p.—Presents a series of studies which describe the pathological mechanisms behind clinical neurological disorders, including developmental disorders of the central nervous system; disturbances of autonomic and visceral function; trauma and demyelinating diseases of the nervous system; metabolic encephalopathies; and disorders of nerve and muscle, cortical function, cerebral circulation, and movement.

1534. Etchegoyhen de Lorenzo, Eloisa G. (National Council on Primary & Normal Teaching, Uruguay) **[Problems to be considered in the diagnosis of a child with minimum brain dysfunction.]** (Span) *Revista Brasileira de Deficiência Mental*, 1972(Mar), Vol 7(1), 11-17.—Describes the symptoms of minimum brain dysfunction and reviews research on diagnosis and the evaluation of intelligence of affected children. A program for special training and for family education is given, and an appendix presents a taxonomy of school behavior. (21 ref)

1535. Evans, N. J.; Baldwin, J. A. & Gath, Dennis. (Raddcliffe Infirmary, Oxford, England) **The incidence of cancer among in-patients with affective disorders.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 518-525.—Used data from the Oxford Record Linkage Study in an attempt to replicate the finding of T. A. Kerr et al (see PA, Vol 44:14921) that a characteristic form of depressive illness may be a precursor of cancer. 823 patients (10-85 yrs old) admitted to general or psychiatric hospitals during 1963-1964 with a principal diagnosis of depression were studied, and any hospital admissions or deaths were recorded for a standardized 4-yr follow-up period. As predicted from earlier studies, rates for deaths from natural causes and suicide were significantly higher than those for the background population. However, morbidity and mortality rates for malignant diseases diagnosed after the depressive illness were not above expected values. It is concluded that, although the hypothesized relationship is not disproved by the data, the findings of Kerr et al cannot be replicated using the Internal Classification of Diseases categories of affective disorder. (16 ref)—*Journal summary.*

1536. Gatehouse, R. Wayne & Cox, William. (U Guelph, Ontario, Canada) **Localization of sound by completely monaural deaf subjects.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 179-183.—Re-examined the ability of monaurally deaf Ss to localize sounds in space, using a very strict definition of "monaural deafness" (average hearing level for deaf ear, 87 db; for

good ear, 8 db). 8 monaural Ss and 8 normal-hearing Ss were tested in a 12 x 10 ft room. The sound source was a movable earphone which could be positioned at 1 of 40 different points on an imaginary 7-ft sphere surrounding S's head. Stimuli were white noise bursts (10/sec for 3 sec) at an average sound pressure level of 72 db measured at S's head. Ss were blindfolded during testing. Monaural Ss performed well above chance level on horizontal localization but no better than chance for vertical localization. Normal-hearing Ss performed better on both horizontal and vertical localization. The finding of good horizontal localization by monaural Ss contradicts the assumption that binaural processes (interaural phase, time, and/or intensity differences) are required in order to explain sound localization ability.—M. B. Meikle.

1537. Gianotti, Mariella & Pereira, Neide. **[Psychological approaches to the cerebral palsied child.]** (Port) *Revista Brasileira de Deficiência Mental*, 1972(Mar), Vol 7(1), 5-9.—Considers some of the effects of cerebral palsy on the perceptive, emotional, and especially the intellectual development of children. Evaluation of the intellectual level of cerebral palsied children is discussed. (English summary)

1538. Gordon, H. W. & Bogen, J. E. (Israel Inst of Technology, Aba Khoushy Medical School, Haifa) **Hemispheric lateralization of singing after intracarotid sodium amylobarbitone.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Jun), Vol 37(6), 727-738.—Investigated hemispheric lateralization of singing in patients who had transient hemiplegia after intracarotid injection of sodium amylobarbitone. It was found that after right-carotid injection singing was markedly deficient, whereas speech remained relatively intact. Songs were sung in a monotone, devoid of correct pitch rendering; rhythm was much less affected. In contrast, singing was less disturbed than speech after left-carotid injection. These observations indicate a double dissociation; the right hemisphere contributed more for singing, whereas the left demonstrated its usual dominance for speech. A model is proposed that encompasses audible stimuli as well as tactual or visual stimuli in a scheme of functional lateralization wherein the right hemisphere specializes in processing a complete, time-independent stimulus configuration and the left in a series of successive, time-dependent units. (45 ref)—*Journal abstract.*

1539. Grant, I.; Kyle, G. C.; Teichman, A. & Mendels, J. (U California, San Diego) **Recent life events and diabetes in adults.** *Psychosomatic Medicine*, 1974(Mar), Vol 36(2), 121-128.—Studied fluctuations in diabetic condition and changes in life events in a group of 37 adult diabetic patients over a period of 8-18 mo. Evidence is presented suggestive of a relationship between life events, particularly "undesirable" ones, and changes in diabetic condition. (22 ref)—*Journal abstract.*

1540. Gunn, John. (U London, Inst of Psychiatry, England) **Social factors and epileptics in prison.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 509-517.—Obtained social class, occupational, and family background data from 158 epileptic prisoners, 66 hospitalized epileptics, and 180 nonepileptic prisoners. Data show that the epileptic prisoners exhibited a greater degree of depressive and suicidal pathology, especially in terms of

drinking behavior, than the other 2 groups, although all 3 groups shared several similar social characteristics. (16 ref)

1541. Hans, Michael A. (State U. New York, Albany) **Imagery and modality in paired-associate learning in the blind.** *Bulletin of the Psychonomic Society*, 1974(Jul), Vol. 4(1), 22-24.—13 congenitally blind Ss learned lists of 12 noun-noun word pairs in a paired-associates task, where the visual and auditory image-producing qualities of the stimulus and response terms of the pairs were varied. Performance on the paired-associates recall task was not affected by the imagery-producing quality of either the stimulus or response terms. However, the interaction of these qualities for the stimulus and response positions was significant, with Ss recalling more pairs when the imagery-producing qualities of the stimulus and response terms matched. Data are interpreted as a rejection of a modality-specific imagery hypothesis.—*Journal abstract.*

1542. Hartlage, Lawrence C. (Medical Coll Georgia, Atlanta) **Ten-year changes in attitudes toward different types of handicaps.** *Revista Interamericana de Psicologia*, 1974, Vol 8(1-2), 25-28.—Administered a questionnaire on employers' attitudes toward various types of handicapped workers to 1,220 employers in 1960 and to a 10% random sample ( $n = 122$ ) of employers in 1970 to check for any changes toward the handicapped in the last decade. The types of handicapped included amputees, mental retardates, former mental patients, juvenile delinquents, and epileptics. Attitudes were rated from favorable to unfavorable on a 5-point scale. Results indicate significant improvements in attitudes toward workers with physical or organic types of handicaps and nonsignificant improvements in attitudes toward workers with social or behavioral handicaps. The number of employers who had knowingly hired handicapped workers increased. (Spanish summary)—*S. Slak.*

1543. James, G. A. & Gill, J. M. (U. Nottingham, Blind Mobility Research Unit, England) **Mobility maps for the visually handicapped: A study of learning and retention of raised symbols.** *American Foundation for the Blind, Research Bulletin*, 1974(Apr), Vol 27, 87-98.—25 visually handicapped children, 18 boys and 7 girls 7-17 yrs old, learned meanings of 14 tactual map symbols. 6 Ss did not reach learning criterion of 2 errorless trials. Retention, measured 3 wks later, showed 40.2% savings. Some symbols were learned with fewer errors than others. (19 ref)

1544. Jenkins, C. David; Rosenman, Ray H. & Zyzanski, Stephen J. (Boston U, Medical School, Div of Psychiatry) **Prediction of clinical coronary heart disease by a test for the coronary-prone behavior pattern.** *New England Journal of Medicine*, 1974(Jun), Vol 290(23), 1271-1275.—Results of a prospective study of 2,750 employed men who completed a computer-scored test questionnaire—the Jenkins Activity Survey—measuring the coronary-prone Type A behavior pattern show that high scorers had twice the incidence of new coronary heart disease as low scorers over a 4-yr period. Ss with different initial clinical manifestations of coronary disease did not differ in their Type A test scores. The double-blind design of these studies and the orderly relation of Type A scores to coronary-disease risk

suggest that the coronary-prone behavior pattern is prospectively linked to the pathogenesis of coronary heart disease. The findings indicate that the questionnaire used is a valid means of measuring some of the ways in which behavior contributes to coronary risk.—*Journal abstract.*

1545. Kelleher, Dennis E. (Yolo County Schools, Low Vision Program, Woodland, CA) **Educational background and considerations of low vision aids: Review of related literature.** *American Foundation for the Blind, Research Bulletin*, 1974(Apr), Vol 27, 99-109.—Surveys general approaches to educating the visually impaired (residential school, itinerant approach, etc) and discusses development and use of bioptic glasses. (79 ref)

1546. Kinsman, Robert A.; Spector, Sheldon L.; Shucard, David W. & Luparello, Thomas J. (National Jewish Hosp & Research Ctr, Psychophysiology Research Lab, Denver, CO) **Observations on patterns of subjective symptomatology of acute asthma.** *Psychosomatic Medicine*, 1974(Mar), Vol 36(2), 129-143.—Notes that 5 symptom categories have previously been identified which describe the subjective symptoms experienced during asthma attacks: 2 mood symptom categories (panic-fear and irritability), describing affective states concomitant with asthma; 2 somatic symptom categories (hyperventilation-hypocapnia and airway obstruction) describing reports of more specific bodily symptoms; and fatigue, describing the reduced energy level accompanying asthma attacks. 15 patterns of asthma symptomatology based on reported frequency of the 5 symptom categories during asthma attacks were identified within a group of 51 male and 49 female 14-67 yr old inpatients with asthma. The relationships between scores on the individual symptom categories within patterns showed that (a) hyperventilation-hypocapnia symptoms were associated with generally high levels of the mood symptom categories, but not clearly related to the reported frequency of airway obstruction symptoms; (b) high fatigue symptom scores accompanied both high mood symptom and airway obstruction symptom category scores; and (c) high airway obstruction scores were not necessarily associated with high scores on the mood symptom categories. Ss who showed patterns with high mood symptom scores were prescribed higher steroid regimens upon discharge. Alternative explanations for the latter finding are discussed in some detail. (23 ref)—*Journal abstract.*

1547. Kirtley, Donald & Cannistraci, Katherine. (California State U, Fresno) **Dreams of the visually handicapped: Toward a normative approach.** *American Foundation for the Blind, Research Bulletin*, 1974(Apr), Vol 27, 111-133.—Applied the Hall-Van de Castle system of quantitative content analysis to dreams of 7 visually handicapped Ss (5 adventitiously and 2 congenitally impaired) over a 2-4 mo period. There were wide individual differences between Ss (or groupings of Ss) and between the Ss and the normative groups on which the system is based. 5 factors are given particular attention: mobility, aggressive behavior, friendly interaction, self-perception, and perception of the physical environment. Conclusions are tentative because the sample was small. (15 ref)—*W. E. Collins.*

1548. Krant, Melvin J. **Dying and dignity: The meaning and control of a personal death.** Springfield, IL: Charles C Thomas, 1974. vii, 154 p.—Based on experiences with hospitalized terminal cancer patients, the author examines the possibility of achieving dignity and meaning in dying. Social and psychological characteristics of the dying experience are discussed, hospital and family practices in communication and support are reviewed, and issues surrounding euthanasia are considered.

1549. Kusumi, Yoshitaro & Prange, Arthur J. (U. North Carolina, Medical School, Chapel Hill) **Triple mosaicism of X-chromosomes with bipolar affective psychosis.** *Diseases of the Nervous System*, 1973(Feb), Vol. 34(2), 94-97.—Reports the case history of a 47-yr-old woman with bipolar affective disorder who was found to have triple mosaicism of X-chromosomes. Manic-depressive symptoms had been present intermittently for 22 yrs. Hereditary predisposition could not be identified. The possibility that the mosaicism of X-chromosomes may have predisposed the patient to affective psychosis is discussed. (43 ref)—*Journal summary*.

1550. Lackner, James R. (Brandeis U) **Observations on the speech processing capabilities of an amnesic patient: Several aspects of H. M.'s language function.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 199-207.—Reports that although the ability of a patient with severe amnesic syndrome to detect various kinds of linguistic ambiguity appeared essentially normal, his performance on a linguistic task involving the ongoing perceptual segmentation of speech was not normal. The constituent structure clause constituted the functional unit in his short-term for linguistic material. (French & German summaries)

1551. Lanyon, Richard & Giddings, John W. (Erich Lindermann Mental Health Center, Boston, Mass.) **Psychological approaches to myopia: A review.** *American Journal of Optometry & Physiological Optics*, 1974(Apr), Vol. 51(4), 271-281.—Reviews the literature on psychological or behavioral factors in the development and modification of myopia. A wide variety of topics in psychology are involved, and a number of potentially fruitful areas for further research are cited. With respect to the development of myopia, it is concluded that (a) axial length of the eyeball is a critical physiological variable; (b) heredity plays a definite though minor role; (c) there are personality and intellectual correlates of myopia; and (d) excessive visual near-work behavior is almost certainly a powerful, relevant factor. The demonstration of temporary changes in subjective acuity and refractive error by behavioral means supports a view of myopia as a behavioral-physiological disorder. (72 ref)—*Journal abstract*.

1552. Leisman, Gerald. (U Manchester, England) **The relationship between saccadic eye movements and the alpha rhythm in attentionally handicapped patients.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 209-218.—Investigated the relationship between electro-oculographic potentials (EOG) and the alpha rhythm in 36 spastic-hemiplegic Ss with attentional handicaps and in 28 normal controls. It was hypothesized that the alpha rhythm is temporally related to the EOG. Alpha rhythm

and the EOG were measured and experimentally varied by changes in illumination and by stabilized retinal image techniques. Results are consistent with the hypothesis and indicate that deviant patterns of scanning and fixation saccadic eye movements may be important components in attentional handicaps. (French & German summaries) (26 ref)—*Journal abstract*.

1553. Lucas, Alexander R. & Rodin, Ernst A. (Wayne State U., Medical School) **Electroencephalogram in Gilles de la Tourette's disease.** *Diseases of the Nervous System*, 1973(Feb), Vol. 34(2), 85-89.—Studied the EEGs of 18 children and adolescents with Gilles de la Tourette's disease, a syndrome involving generalized body tics, vocal tics, and coprolalia. EEG recordings were made during waking, sleeping, hyperventilation, and photic stimulation. 10 of the Ss manifested normal patterns, and 5 exhibited abnormal, nonspecific configurations. 2 patients showed generalized abnormalities. In none of the cases did surface EEGs show evidence of abnormal electrical activity during the occurrence of tics. Data support previous findings that there is no typical EEG pattern in patients with this disease. The possibility of a common metabolic aberration in the disease was supported by the finding that the disorder was transmitted from mother to son in 1 case. (16 ref)—*A. Olson*.

1554. MacDonald, Gregory. (Royal Danish School of Educational Studies, Inst. of General Psychology, Copenhagen) **The effect of retinitis pigmentosa on brightness and saturation under photic intermittency.** *American Journal of Optometry & Physiological Optics*, 1974(Apr), Vol. 51(4), 264-265.—Describes a study in which an observer with normal vision perceived brightness enhancement and desaturation when a visual target was presented intermittently. Another observer with retinitis pigmentosa (a degenerated scotopic system) saw brightness enhancement but was unable to detect desaturation under photic intermittency. Results suggest that desaturation involves a luminosity mechanism rather than, or as well as, a chromaticity mechanism.—*Journal abstract*.

1555. McManis, Donald L. & Roth, Gloria. (Eastern Washington State Coll) **Performance of brain-damaged and non-damaged retardates on the memory-for-designs.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 583-588.—Administered the Memory-for-Designs test to 20 brain-damaged and 20 nondamaged retardates matched for sex, IQ (57-83), and CA (20-51 yrs). 2 raters independently scored each protocol, with reliability between .93 and .97. Analysis of variance of pooled raw scores showed no significant variances for diagnostic category, sex, or their interaction. Diagnostic classifications by both raw and difference scores were nondiscriminating of brain-damaged from nondamaged Ss, reflecting 70% false positive rate for the nondamaged. Analysis of 3-point error scores showed significant variance for diagnostic category in the predicted direction. Classification by 3-point errors had accuracy levels of 80% for male and female nondamaged Ss, 70% for female brain-damaged Ss, but only 50% for male brain-damaged Ss.—*Journal abstract*.

1556. McManis, Donald L. & Roth, Gloria. (Eastern Washington State Coll, Child Development Ctr) **Social reinforcement effects on block design performance by**

**brain-damaged children of normal intelligence.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1059-1065.—12 male and 6 female 6-14 yr old cerebral palsied children of normal general intelligence (IQ range 80-127) were matched for IQ and WISC Block Design pretest performance accuracy and speed and assigned to experimental and control groups of 9 Ss each. Control Ss repeated the test under standardized conditions while experimental Ss received praise for each correct block placement on retesting. Experimental Ss decreased significantly ( $p < .05$ ), while control Ss increased slightly, in performance accuracy from pre- to posttest. Control Ss exceeded experimental Ss significantly in posttest but not pretest accuracy. Both groups showed nonsignificant increases in speed on the posttest. —*Journal abstract.*

1557. **McQ. Reynolds, Don & Jeeves, M. A.** (U St Andrews, Psychological Lab, Fife, Scotland) **Further studies of crossed and uncrossed pathway responding in callosal agenesis: Reply to Kinsbourne and Fisher.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 287-290.—Compared crossed and uncrossed response latencies to lateralized visual stimulation in an acallosal 12-yr-old girl. S's crossed pathway response latencies were significantly longer than the uncrossed latencies under a temporal stimulation 2-handed condition and a nasal stimulation single-handed condition. (French & German summaries)

1558. **Meads, Sue & McLemore, Thomas .** (US DHEW, National Ctr for Health Statistics, Div of Health Resources Utilization Statistics, Rockville, MD) **The National Ambulatory Medical Care Survey: Symptom classification.** *Vital and Health Statistics, Series 2*, 1974(May), No 63, 35 p.—Presents a classification specifically designed to code patients' expressions of their symptoms, complaints, and problems, as collected by the National Ambulatory Medical Care survey. The coding scheme consists of 197 rubrics grouped into 13 classes around an anatomical axis. (15 ref)

1559. **Naditch, M. P.** (Cornell U) **Locus of control, relative discontent and hypertension.** *Social Psychiatry*, 1974(Jul), Vol 9(3), 111-117.—Hypothesized, based on a means-end motivational framework, that the combination of high discontent and a perceived external locus of control would be related to hypertension. 408 21-45 yr old black men and women in 6 American cities, part of a national sample of urban blacks, were Ss. Discontent was measured by Cantril's Self-anchoring Striving Scale; locus of control was assessed with 4 items from Rotter's Internal-External Control Scale and 3 items used by Coleman et al in their 1966 study of educational opportunity. These measures were administered during the initial national sample survey, and blood pressure readings were taken during a 2nd interview. Results support the hypothesis for the entire sample and for men, but not for women when these were analyzed separately. (37 ref)—*Journal abstract.*

1560. **Paull, Andrew & Hislop, Ian G.** (Queen Elizabeth Hosp, Gastroenterology Unit, Woodville, South Australia) **Etiologic factors in ulcerative colitis: Birth, death and symbolic equivalents.** *International Journal of Psychiatry in Medicine*, 1974(Win), Vol 5(1), 57-64.—Documented the incidence of life crises before

the onset of symptoms in 50 patients with ulcerative colitis, and found it to be significantly higher than in a matched group of normal control Ss. The gain or loss of psychic object to the individual patient has been emphasized as relevant in the etiology of this illness. In 94% of the cases birth or death—actual, threatened, symbolic, or fantasied—had occurred within the 12 mo before the onset of illness. (24 ref)—*R. M. Cohen.*

1561. **Peel, Jennifer C.** (U Nottingham, Blind Mobility Research Unit, England) **Psychological aspects of long cane orientation training.** *American Foundation for the Blind, Research Bulletin*, 1974(Apr), Vol 27, 159-186.—Presents a 4-part paper. Part 1 is a critique of psychological aspects of standard long-cane training. Part 2 reports an experiment which compared standard with alternative training techniques; qualitative but not quantitative differences were obtained. Part 3 describes an experiment to determine the ability of long-cane users to detect a drop below ground level; over half the Ss were able to detect a 4-cm drop 50% of the time and a 6-cm drop 80% of the time. Part 4 reports an experiment to determine the effect of augmented knowledge of results on the acquisition of skill in cane handling; Ss given only verbal instructions consistently overestimated the extent of the required cane movement and made generally larger errors than Ss who were given tactual knowledge of results or were trained by a response-restriction technique. (21 ref)—*W. E. Collins.*

1562. **Reimer, Donald R. & Nagaswami, Supramoney .** (Menninger School of Psychiatry, Topeka, KS) **Catatonic schizophrenia associated with cerebral arterial malformations and with membranous glomerulonephritis.** *Psychosomatics*, 1974, Vol 15(1), 39-40.—Presents 2 cases diagnosed as catatonic schizophrenia by board-certified psychiatrists. They were ultimately shown to have a diagnosis of organic brain dysfunction. Catatonic schizophrenia-like states have been described occurring with hyperparathyroidism, tuberous sclerosis, and akinetic mutism, and secondary to fluorides. Careful neurological and medical investigations of all patients presenting the clinical picture of catatonic schizophrenia is considered essential.—*A. S. Kulkarni.*

1563. **Richardson, Stephen A.; Ronald, Linda & Kleck, Robert E.** (Albert Einstein Coll of Medicine, Rose F. Kennedy Ctr, Yeshiva U) **The social status of handicapped and nonhandicapped boys in a camp setting.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 143-152.—Studied friendship and preference patterns of 193 8-13 yr old boys with and without physical handicaps who were attending a summer camp. The intensity of the social relations and the appearance of the disability were considered in analyzing the boys' interview responses. Visibly handicapped boys were the most socially disadvantaged, nonvisibly handicapped boys were in an intermediate position, and nonhandicapped boys had the highest social status. Nonvisibly handicapped boys were more positively evaluated by boys outside the primary social group than by those within. The need to closely examine the behavior patterns of these groups of boys and the relationship of behavior to social status among peers are discussed.—*Journal abstract.*

1564. **Ritter, Gerhard**. (U Göttingen, Neurological Clinic & Polyclinic, W Germany) [Epilepsy and social prejudice in the light of history.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1973(Dec), Vol 25(12), 754-761.—Traces social prejudice toward epilepsy as depicted in medieval woodcuts and more modern paintings. Theological doctrines and social and political developments have always influenced the public image of the epileptic. Social prejudice has greatly receded since the discovery of anticonvulsants in the 1950s.—*K. J. Hartman*.

1565. **Robinson, Daniel N., & Berman, A. J.** (Georgetown U) **Biophysical assessments of diseases of involuntary movement.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1243-1247.—Describes some quantitative approaches to the study of diseases of involuntary movement based on data from simple tracking task in which the elasticity (*K*), electromagnetic damping (*B*), and inertia (*J*) of the control stick were systematically varied. 2 patients with Parkinson's disease, 2 with multiple sclerosis, and 1 with Huntington's chorea performed the tracking task; target velocities were either 5, 10, or 20 sec, and *K* was either 0, .024, or .042 lb/degree; *B* was 0, 5, or 10 v, and *J* was 0, 2, or 10 lb. Each S completed 3 trials at each combination of values over a 4-7 day period. Results show that patients with disease of involuntary movement do not respond similarly to spring, weight, and damping even when they exhibit essentially identical tremor rates and amplitudes.—*L. Gorsey*.

1566. **Sadoughi, W., & Bush, Irving M.** (Cook County Hosp, Div of Urology, Social Evaluation Clinic Section, Chicago, IL) **Urologic symptoms as a psychological crutch for underlying sex problems.** *Medical Aspects of Human Sexuality*, 1974(Jul), Vol 8(7), 130-143.—Based on the author's clinical observations, it is suggested that a strong emotional overlay is an integral part of many urologic disorders. This may occur in 3 situations in which either the patient experiences sexual difficulties because of the genito-urinary problem, the patient's inadequate sexual experience is a cause of the urologic complaint, or the sexual problems are increased by a lack of communication between physician and patient. It is recommended that physicians include sexual questions in history-taking to uncover the real problem. Suggestions for treating the most difficult patient of this type, the one who is convinced that his medical condition has caused his sexual inadequacy, are presented. Physicians should also be aware of the sexual effects of many common tranquilizers, hormones, or other medications prescribed for urologic conditions. Brief case illustrations are presented.—*L. Gorsey*.

1567. **Salonna, F., & Quaranta, A.** (U Bari, Italy) **Frequency discrimination under masking in normal and in pathological ears.** *Journal of Auditory Research*, 1972(Apr), Vol 12(2), 129-132.—Investigated the frequency difference limen (DL) at 2 kHz in 8 normal Ss and in 15 unilaterally hearing-impaired Ss (8 with Ménière's disease, 7 with sensorineural defects). Both the 2 kHz-standard tone and the test tones (slightly lower frequencies) were presented at 20 db sensation level (SL) with durations of .5 sec and interstimulus interval of 1 sec. In addition DLs were measured under 3 conditions

of masking: (a) with continuous homolateral white noise masking, both tone signals delivered at 20 db re the unmasked SL; (b) with the same masker, both tone signals at 20 db above their unmasked threshold; and (c) with continuous contralateral white noise at 30 db SL. Unmasked DLs for normal ears ranged from 4 to 20 Hz, while those for pathological ears ranged from 20 to 80 Hz. Masking condition (a) increased the DL in all Ss. Condition (b) did not alter the DL in normal Ss but in pathological ears produced results similar to condition (a). Condition (c) was very disruptive to frequency discrimination in all but 2 of the normal Ss but had no significant effect on DLs in the hearing-impaired.—*M. B. Meikle*.

1568. **Schechter, Paul J., & Henkin, Robert L.** (NIH, National Heart & Lung Inst, Bethesda, MD) **Abnormalities of taste and smell after head trauma.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Jul), Vol 37(7), 802-810.—Studied abnormalities of taste and smell in 29 patients after head trauma. These abnormalities included decreased taste acuity (hypogeusia), a distortion of taste acuity (dysgeusia), decreased smell acuity (hyposmia), and a distortion of smell acuity (dysosmia). This syndrome can occur even after minimal head trauma and can begin months after the moment of injury. The patients exhibited a significant decrease ( $p > .001$ ) in total serum zinc concentration and a significant increase in total serum copper concentrations ( $p < .001$ ) compared with controls. It is noted that symptoms of hypogeusia, dysgeusia, and dysosmia are frequent sequelae of head injury and are important to the patients and to their care after trauma. (27 ref)—*Journal abstract*.

1569. **Shearn, Charles R., Berry, David F., & Fitzgibbons, David J.** (Inst of Living, Hartford, CT) **Usefulness of the Memory-for-Designs Test in assessing mild organic complications in psychiatric patients.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1099-1104.—Administered the Memory-for-Designs Test (MFD) to 3 matched groups of Ss aged 40 yrs or older: psychiatric patients suspected of organicity on initial clinical examination, patients not suspected of organicity, and nonhospitalized normals. No Ss had known brain damage. Patients suspected of organicity and normals differed significantly in mean MFD score. There were no other group differences. 4 mo later, the same patients were again classified as (currently) suspected or not suspected of organicity. Group means on the original MFD scores were compared. The reconstituted "suspected" group differed significantly from the other 2 groups, which did not differ from each other, suggesting that initial MFD score predicts more accurately later psychiatric classification than does initial psychiatric classification.—*Journal abstract*.

1570. **Smith, Eileen**. (National Hosp for Nervous Diseases, London, England) **Influence of site of impact on cognitive impairment persisting long after severe closed head injury.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1974(Jun), Vol 37(6), 719-726.—Studied the cognitive abilities of 356 right-handed men who had sustained a severe closed head injury between 10 and 20 yrs earlier. Results show that a right-sided impact produced greater deficits than a left-sided impact in both

verbal and nonverbal skills. Results are interpreted as reflecting left-hemisphere damage due to contrecoup injury. Some evidence that a left frontal impact was apt to result in defective visual-spatial functioning is presented. These observations accord with some theories on the mechanics of head injury and with observations on the predictability of sites of cerebral contusion in brain injury uncomplicated by dural penetration, intracranial infection, or cerebral infarction. The roles of the duration of posttraumatic amnesia, the level of neurological responsiveness at the time of admission to hospital, and the age at which the injury was sustained are discussed. (39 ref)—*Journal abstract*.

1571. Spencer, Roger F. & Raft, David D. (U North Carolina, Medical School, Consultation Service, Chapel Hill) **Adaptation and defenses in hypopituitary dwarfs.** *Psychosomatics*, 1974, Vol 15(1), 35-38.—Presents 3 case histories. Little evidence was found to support the contention that pituitary deficiency results in a lowering of aggressive drive. Some persistence of grandiose fantasies, in preference to more active coping mechanisms, was observed. The formation of sexual and work identities was uncompleted in these patients.

1572. Stromberg, J. et al. (World Health Organization, Div of Strengthening of Health Services, Geneva, Switzerland) **Predicting participation in a screening examination for ischaemic heart disease risk factors: Experience from the Zagreb preliminary study.** *Social Science & Medicine*, 1974(May), Vol 8(5), 275-286.—Data from a study of 601 males in Zagreb, Yugoslavia, who were interviewed before they volunteered to participate in a screening examination for ischemic heart disease show that the item which most accurately predicted participation in the screening examination was one which directly assessed the S's willingness to have a thorough physical examination to determine his physical status. Health-related attitudes were not related to participation, and educational and occupational background were only slightly related to participation. (37 ref)

1573. Tumba, A. (U Louvain, Div of Human Genetics, Belgium) **[The anatomoclinical parameters of XXXY phenotype: Study of a case and review of the literature.]** (Fren) *Acta Psychiatrica Belgica*, 1973(Mar), Vol 73(2), 233-255.—Presents a case study of a patient with a XXXY syndrome and compares findings in this individual with others reported in the literature. (Dutch, English, German, Italian & Spanish summaries) (2 p ref)

1574. Tuttle, Dean W. **A comparison of three reading media for the blind: Braille, normal recording, and compressed speech.** *American Foundation for the Blind, Research Bulletin*, 1974(Apr), Vol 27, 217-230.—104 braille readers 14-21 yrs old took the Reading Versatility Test, Intermediate Level, in 3 equivalent forms: braille, normal recording, and compressed speech. Comprehension scores were the same for the 3 forms of presentation. Compressed speech was more efficient than normal speech, which in turn was more effective than braille. Braille reading took about twice as long as listening to normal speech and almost 3 times as long as listening to compressed speech. 4 classifications of Ss were identified on the basis of comprehension scores: high braille, high listeners; high braille, low

listeners; low braille, high listeners; low braille, low listeners. For each group, compressed speech was the most efficient medium. Compressed speech materials are recommended, but individual differences in ability to use them efficiently are noted. (140 ref)—*W. E. Collins*.

1575. Tuxen, I. (Vocational & Social Guidance Office for the Hard of Hearing, Copenhagen, Denmark) **Educational and vocational problems in adolescents with slight and medium loss of hearing.** *Scandinavian Audiology*, 1972(Sep), Vol 1(3), 111-114.—Notes that the occupational and social problems facing the slightly and moderately hard-of-hearing are often more or less ignored. However, experience shows that it is often necessary for this group to be supervised by experts who have up-to-date knowledge of the benefits available from the relevant social services and insight into the different occupational demands on hearing. Without such help young people with a hearing handicap may easily develop massive handicaps and fail because of their defective hearing. (Danish summary)—*Journal abstract*.

1576. Van Putten, Theodore & Menkes, John H. (U California, Medical School, Los Angeles) **Huntington's disease masquerading as chronic schizophrenia.** *Diseases of the Nervous System*, 1973(Jan), Vol 34(1), 54-56.—Presents 3 case histories of patients with Huntington's disease masquerading first as schizophrenia and then as schizophrenia with a phenothiazine-induced motor disorder. Such cases demonstrate the difficulties encountered in diagnosing Huntington's disease. It is suggested that complete family histories and careful neurological examinations be obtained before prescribing phenothiazine therapy for apparent schizophrenics. (21 ref)—*M. Oscar-Berman*.

1577. Ware, Colin & Mitchell, Donald E. (Dalhousie U, Halifax, Nova Scotia, Canada) **On interocular transfer of various visual aftereffects in normal and stereoblind observers.** *Vision Research*, 1974(Aug), Vol 14(8), 731-734.—Measured tilt, threshold-evaluation, and spiral-motion aftereffects in 2 strabismic and 2 normal Os. In contrast to normal Os, both strabismic Ss failed to show any appreciable interocular transfer in any of the 3 aftereffects, consistent with the suggestion that Ss without stereopsis lack binocular neurones. (24 ref)

1578. Warrington, Elizabeth K. & Baddeley, A. D. (National Hosp, London, England) **Amnesia and memory for visual location.** *Neuropsychologia*, 1974(Mar), Vol 12(2), 257-263.—Studied short-term memory (STM) and long-term memory (LTM) for visual stimuli not readily verbalizable in 7 amnesic patients and 6 neurological patients matched on age and IQ. Decay functions for recall of the location of a single dot stimulus over retention intervals of 1-60 sec were measured. Recall of the location of 5 randomly positioned dots after 10 learning trials was tested using a 2-min retention interval. It was found that the amnesic patients' performance was not significantly worse on the former task (the STM task) but showed a significant deficit on the latter (LTM) task. In addition, 3 patients with a selective impairment of auditory verbal STM were tested. Findings are discussed in relation to comparable tasks of verbal STM and LTM. (French & German summaries) (17 ref)—*Journal abstract*.

1579. Waxman, Stephen G. & Geschwind, Norman. (Harvard U, Medical School, Boston) **Hypergraphia in temporal lobe epilepsy.** *Neurology*, 1974(Jul), Vol 24(7), 629-636.—Describes the phenomenon of hypergraphia, or the tendency toward extensive and, in some cases, compulsive writing in temporal lobe epilepsy in 7 patients, in each of whom there was EEG evidence of a temporal lobe focus. Unusually detailed and strikingly copious writing was evidenced in each patient. 6 patients provided documentation of their extensive writing, which often was concerned with religious or moral issues. A 7th patient claimed to have written extensively, but refused to exhibit his writings. Aggressiveness, religiosity, and changes in sexual behavior in temporal lobe disorders have been described previously. The hypergraphia of temporal lobe epilepsy appears to be part of a specific behavioral syndrome of special interest because of its association with dysfunction at specific anatomic loci. (27 ref)—*Journal abstract.*

1580. Webb, Nancy C. **The use of myoelectric feedback in teaching facial expression to the blind.** *American Foundation for the Blind, Research Bulletin*, 1974(Apr), Vol 27, 231-262.—Employed biofeedback to help 5 blind Ss gain skill in controlling facial muscles, thus producing facial expressions at will. Ss were provided with an auditory "mirror" of their facial activity by transducing myoelectric signals from facial muscles into sound. Expressions of happiness, surprise, and anger were defined by involvement of the zygomaticus, the frontalis, and the corrugator muscles, respectively. These muscles were connected through separate voltage-controlled oscillators to loudspeakers, each muscle activating a different speaker. Motion pictures of each S producing the 3 expressions before and after training were assembled in random order and were shown to preselected judges who attempted to identify the expressions. The judges were correct significantly more often on the posttraining expressions. Appropriateness and adequacy of expressions, as rated by the judges, also improved significantly as a result of training. (93 ref)—*Journal abstract.*

1581. Webb, Thomas E. & Oski, Frank A. (U Pennsylvania) **Behavioral status of young adolescents with iron deficiency anemia.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 153-156.—Teacher ratings on the Behavior Problems Checklist failed to discriminate male junior high school students with iron deficiency anemia from nonanemic students in terms of personality disturbances of inadequacy-immaturity. Consistently more conduct problems were reported for anemic students than for nonanemic controls, with a significant age factor also involved.

1582. Wunderlich, Ray C. **Allergy, brains, & children coping.** St Petersburg, FL: Johnny Reads, 1974. ix, 170 p. \$7(hardback), \$5(paper).—Considers the relationship between allergy, brain dysfunction, and coping with environmental tasks. The neuroallergic syndrome is discussed as a broad entity which frequently interferes with a child's coping ability and which requires communication and cooperation between parent, teacher, and physician to ensure the child's proper development.

## TREATMENT AND PREVENTION

1583. ———. Philadelphia's Center House: Inpatient treatment program for the "pre-skid-row man." *Alcohol Health & Research World*, 1973(Spring), Vol 1(1), 8-11.—Presents a short-term (4-mo) rehabilitation program combining social and vocational help for the "pre-skid-row" alcoholic. The major approaches are group therapy, part-time work assignments, encounter therapy, and antabuse medication.—H. J. Freudenberger.

1584. Barton, Anthony. (Duchesne U) **Three worlds of therapy: An existential-phenomenological study of the therapies of Freud, Jung, and Rogers.** Palo Alto, CA: National Press, 1974. x, 271 p. \$8.95(cloth), \$4.95(paper).—Describes the views of the patient held by Freud, Jung, and C. Rogers. The methods of psychoanalysis, Jungian therapy, and client-centered therapy are discussed, and the treatment received by 1 hypothetical client under each approach is used to illustrate these methods.

1585. Blum, Henrik L. (U California, Berkeley) **Planning for health: Development and application of social change theory.** New York, NY: Human Sciences Press, 1974. xvi, 622 p.—Applies planning theory to such basic health concerns as heredity, environmental factors, and behavior patterns. The environment for planning and the achievement and evaluation of the improvements desirable and obtained through planning are detailed.

1586. Coburn, David & Pope, Clyde R. (U Toronto, Ontario, Canada) **Socioeconomic status and preventive health behaviour.** *Journal of Health & Social Behavior*, 1974(Jun), Vol 15(2), 67-78.—Developed a predictive model for socioeconomic status (SES) and preventive health behavior which included variables relating to childhood socialization, social participation, work self-direction, work constraints, powerlessness-planfulness, and health knowledge. Together, education, age, income, and social participation (in that order) provided the most parsimonious set for predicting general preventive health behavior. (18 ref)

1587. Daniels, Robert S. (U Cincinnati) **Some observations about psychiatric services in the U.S.S.R.** *Hospital & Community Psychiatry*, 1974(Aug), Vol. 25(8), 533-535.—Reports observations made by the author during a trip to the USSR in 1972 on the Soviet system of psychiatric care, which emphasizes outpatient and day treatment as opposed to hospitalization. Workshops are widely used for severely disturbed patients.

1588. Foudraire, Jan. **Not made of wood: A psychiatrist discovers his own profession.** (Trans Hubert H. Hoskins). New York, NY: Macmillan, 1974. 414 p. \$9.95.—Presents an account of the author's discovery of how he could help people labeled as schizophrenic and of his subsequent rebellion against his training in psychiatry. The steps that led to his conclusion that psychotics and schizophrenics can teach us most about the human condition are described, and the theory that schizophrenia is an intricate defense system erected in response to a destructive social environment is presented, along with suggestions for new treatment methods for schizophrenics (e.g., open wards and expansion of the role of the paraprofessional).

1589. Kagan, Aubrey R. & Levi, Lennart. (World Health Organization, Div of Strengthening of Health Services, Geneva, Switzerland) **Health and environment—psychosocial stimuli: A review.** *Social Science & Medicine*, 1974(May), Vol 8(5), 225-241.—Describes a model of psychosocial factors and diseases in terms of 6 subsystems (psychosocial stimuli, psychobiological pattern, physiological mechanisms, precursors of disease, the disability of disease itself, and interacting mental or physical variables), and reviews the literature on the interrelationships of these 6 systems. The importance of monitoring and early appraisal of risk of disease from psychosocial factors and evaluating the effects of preventive health actions is discussed. It is concluded that the causation of disease by psychosocial stimuli is still unproven but remains at a high level of probability. The action of such stimuli on the mechanisms and precursors of disease is better understood, and there is some probability that interacting psychosocial factors and physical factors may prevent some diseases. Implications for health planning are discussed. (183 ref)—*Journal abstract.*

1590. Kraus, A. (U Heidelberg, Psychiatric Clinic, W Germany) [The relationship between sex role and sex body: A case history of psychosis after a sex change in congenital adrenogenital syndrome with pseudohermaphroditismus femininus.] (Germ) *Nervenarzt*, 1972(Feb), Vol 43(2), 78-88.—Describes the case of an S who, after a suicide attempt at age 19, had both ovaries removed and underwent testosterone treatment. Married 10 yrs later, he developed a psychosis after 9 yrs of marriage and committed suicide at age 41. The medical and psychological aspects are described in detail and analyzed in the light of contemporary intersex research and theory. The problems, techniques, and results of sex role change in pseudohermaphroditismus femininus are discussed. (40 ref)—*T. Fisher.*

1591. Lipton, Helen L. & Svarstad, Bonnie L. (Albert Einstein Coll of Medicine, Yeshiva U) **Parental expectations of a multi-disciplinary clinic for children with developmental disabilities.** *Journal of Health & Social Behavior*, 1974(Jun), Vol 15(2), 157-166.—Social scientists and health professionals have contended that consumer compliance with professional advice is related to the fulfillment of their expectations. The present study investigated this hypothesis by identifying the content of parental expectations of a diagnostic clinic for children so that in subsequent research these expectations could be related to the parents' subsequent attitudes and behavior. Data from 21 parents, regardless of socioeconomic status and ethnicity, lacked specific and firmly held expectations regarding the kinds of specialists, evaluations, and therapies they desired. Possible sources of this uncertainty, including exploration of parents' medical knowledge, perception of their role as health consumers, and the nature of their prior help-seeking experience were also studied in structured interviews with the parents. The issues and implications generated by these findings, particularly as they relate to the dynamics and outcomes of parent-professional interaction, are discussed.—*Journal abstract.*

1592. Macioszek, Gisela. (U Hamburg, Inst of Psychology, W Germany) [On delayed auditory feed-

back in stutterers with various levels of stuttering severity.] (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 2(4), 278-299.—Studied 72 12-15 yr old male stutterers, divided into 3 groups according to the severity of their affliction, and a control group of 24 nonstutterers. Ss were tested under conditions of synchronous and delayed (.17-sec) auditory feedback. 4 variations of volume intensity were used to produce a continuous increase in the blocking of bone conduction. The controls made the greatest number of mistakes under conditions of delayed feedback, and medium-severity stutterers made the fewest. All stutterers made at least the same number of mistakes under delayed feedback conditions as under synchronous feedback, and sometimes more mistakes, but never fewer. Blocking of bone conduction under conditions of delayed feedback did not by itself produce a decrease in the number of mistakes made by all stutterers. The changes in volume intensity caused the expected changes only in the case of light-severity stutterers; when the blocking of bone conduction was increased they made fewer mistakes. (English summary) (21 ref)—*T. Fisher.*

1593. Rabin, David L.; Kalimo, Esko & Mabry, John H. (Georgetown U. Medical School) **The World Health Organization international collaborative study of medical care utilization: A summary of methodological studies and preliminary findings.** *Social Science & Medicine*, 1974(May), Vol 8(5), 255-262.—Presents preliminary results from a household survey and assessment of characteristics of health service systems in 12 areas in 7 countries. Data indicate that there are similar health-related attitudes in various countries, that patterns of physician use vary according to location and the degree of urbanization, and that the availability of resources does not generally correlate with use. (18 ref)

1594. Seabra-Dinis, Tito. **Antipsychiatry—an ideology of confrontation: Its origins and significance.** *Foreign Psychiatry*, 1973-1974 (Win), Vol 2(4), 3-21.—Specifies problems and practices in psychiatry which gave rise to the antipsychiatric movement: the segregation and restraint of patients, their forced irresponsibility (entailing deprivation of human rights), denial of information, and the meagreness of funds available. The theoretical bases of antipsychiatry as presented by its various exponents in Europe and America are discussed, and its links with sociology, existentialism, and political thought are outlined. For the antipsychiatrist, "mental illness" is merely a label invented by society and the psychiatrist to control deviance; it is not the patient who needs treatment but the society against which he is struggling. Experiments which attempted to put antipsychiatric principles into practice are described, particularly those at Kingsley Hall in London. It is contended that the desire of the antipsychiatrists to "treat society" reflects poverty of thinking, oversimplification, and an outmoded political viewpoint.—*J. Davis.*

1595. Silverman, Franklin H. & Trotter, William D. (Marquette U) **Bibliography related to use of instrumental aids in stuttering therapy: Supplement 2.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1329-1330.—Presents a 41-item supplement to the author's bibliography (see PA, Vol 50:11869) of published and unpublished research reports and theoretical papers on

the influence of masking noise and rhythmic stimulation on stuttering.

1596. Sundberg, Norman D.; Tyler, Leona E. & Taplin, Julian R. (U Oregon) **Clinical psychology: Expanding horizons.** (2nd ed). New York, NY: Appleton-Century-Crofts, 1973. xix, 656 p.—Uses general systems theory as the organizing framework of this 2nd edition on the work of clinical psychologists. Major topics include the conceptual framework of clinical psychology, the design and implementation of improvement programs, and the professional development of the clinician. Suggested readings and research summaries are provided.

1597. Timsit, M. & Sabatier, J. (Medical Psychology & Psychosomatic Medicine Service, Liege, Belgium) [The use of computers in the psychiatric clinic.] (Fren) *Acta Psychiatrica Belgica*, 1973(Mar), Vol 73(2), 272-301.—Reports on procedures and results in the use of computers in psychiatric practice. Techniques and difficulties encountered in coding patient history data are described. Computer usefulness is demonstrated in some noteworthy correlations obtained from 733 cases. (Dutch, English, German, Italian & Spanish summaries) (19 ref)—E. Coché

1598. Travis, Terry A.; Noyes, Russell & Brightwell, Dennis R. (Southern Illinois U, Medical School) **The attitudes of physicians toward prolonging life.** *International Journal of Psychiatry in Medicine*, 1974(Win), Vol 5(1), 17-26.—Analyzes answers to a questionnaire sent to all Iowa physicians; 50% of the questionnaires were returned. Attitudes of the respondents toward omitting life-prolonging procedures, based on their experience with terminal patients, are discussed. Reported opinions also deal with the effect of sharing the decision about prolonging life and with social attitudes which would permit the physician to hasten death.—R. M. Cohen.

1599. Woody, Robert H. (Ohio U) **Forms of mental health consultation.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 283-285.—Mental health consultants who were trained in and identified with behavioral and process models reported differences regarding the form of consultation in which they practice and prefer to engage. It is concluded that consultation research should specify the form preferred and used by the consultant, and training in consultation should be tailored to these preferences.

### Psychotherapy & Psychotherapeutic Processes

1600. Adam, Wolfgang & Wendt, Harro. (Regional Neuropsychiatric Hosp, Uchtspringe, E Germany) [Dispensary treatment of outpatient schizophrenics.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1973(Dec), Vol 25(12), 748-753.—Describes successful experience in dispensary treatment of schizophrenics. Length of stay and overutilization of hospital facilities were drastically reduced by providing low-cost outpatient treatment. The expression "psychiatry without a bed" has gained wider acceptance in Germany since 1967. Psychotic episodes are successfully controlled by medication supplied to outpatients on their regularly scheduled visits to the dispensary.—K. J. Hartman.

1601. Ahsen, Akhter. **Basic concepts in eidetic psychotherapy.** New York, NY: Brandon House, 1973.

xviii, 434 p.—Examines eidetic imagery, which differs from ordinary imagery in that it stands midway between imagination and physiological after-image. Since the eidetics circumvent the patient's prevalent intellectual resistances, they have an advantage over verbal approaches. Aspects of personality can be changed by a repeated process involving the deliberate projection of certain crucial eidetics until the affect associated with them is exhausted. In this manner aspects of the problematic experience, as well as unexpressed fantasies related to these experiences, can be undone. The areas of hysterias, psychosomatics, acute neurosis, and schizophrenias are covered.

1602. Allen, Robert D. & Wolfe, Thomas F. (California State U, Sacramento) **Psychotheatrics.** Sacramento, CA: Psychotheatrics, 1974. 72 p.—Describes a theory technique which combines the use of psychology and theater. Environmental, playwright, and spectator elements of psychotheatrics are discussed, the differences between psychodrama and psychotheatrics are outlined, and facilities and workshops are described. (23 ref)

1603. Ammon, Karin. (Free U Berlin, W Germany) [A contribution to the use of countertransference in psychoanalytic treatment.] (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(3), 138-150.—Discusses 2 views of countertransference. It can be seen either as a disturbing factor in the analytic process that should be eliminated or as a help in structuring the analytic situation. The active application of countertransference as a central function in therapy for patients with archaic ego-illnesses is illustrated by a description of the treatment of a borderline patient.—H. Bruml.

1604. Bach, Otto; Grüss, Ursula & Hirsch, Cornelia. (Karl Marx U, Psychiatric Clinic, Leipzig, E Germany) [Relationships between somato- and sociotherapy of endogenic psychoses.] (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1973(Dec), Vol 25(12), 741-747.—Speculates regarding the correlation between socio- and somatherapeutic variables. Sociotherapies (e.g., group sessions, occupational therapy, and music therapy) have beneficial effects on endogenous psychoses such as depression and schizophrenia. Somatherapy, specifically medication, seems enhanced by being combined with sociotherapy.—K. J. Hartman.

1605. Barrett, Carol J.; Berg, Pamela I.; Eaton, Elaine M. & Pomeroy, E. Lisa. (U Southern California) **Implications of women's liberation and the future of psychotherapy.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 11-15.—Presents a brief review of personality theories and psychotherapeutic activities to point out how such theories and practices have contributed to the myth of the inferiority of women. Traditional therapy is portrayed as having served to bring woman to accept her oppressed condition rather than encouraging active striving toward self-satisfying goals. Recommendations include training to increase the awareness of sources of oppression in therapists, the education of more female therapists, and such things as assertion training for women and consciousness-raising groups.—C. P. McCreary.

1606. Barron, Jules. **Poetry and therapeutic communication: Nature and meaning of poetry.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr).

Vol 11(1), 87-92.—Suggests an analogy between poetry as a creative process and the communication that takes place in psychotherapy. Both processes represent man's efforts to express and integrate the deeper levels of the person. Psychopathology, e.g., schizophrenia, represents symbolic creations of unique personal meaning but the disturbed person is not able to experience his separateness without being threatened with loss of identity. Poetry may be helpful in communicating the therapist's understanding of the patient's unique struggles involving hope, despair, loneliness, life, and death. Poems that have contributed to communication are noted.—C. P. McCreary.

1607. Calhoun, Karen S.; Adams, Henry E. & Mitchell, Kevin M. (U Georgia) **Innovative treatment methods in psychopathology.** New York, NY: John Wiley & Sons, 1974. xii, 429 p. \$16.95.—Presents a collection of 9 theoretical and experimental papers on the treatment of specific psychopathological disorders, including stuttering, depression, sexual deviation, delinquency, alcoholism, psychophysiological problems, schizophrenia, and psychosomatic disorders.

1608. Cochrane, Carolyn T. (Family Service & Mental Health Ctr, Chicago Heights, IL) **Development of a measure of empathic communication.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 41-47.—Developed a measure of empathic communication and related it to a measure of empathic inference. Previous research had shown inconsistent relationships between these 2 approaches to measuring empathy. The newly devised measure for rating communication had 6 elements (internal, separation, accuracy, concrete, energy, and caring). 18 graduate students in psychology underwent therapy analogue procedure. An experienced therapist rated their responses according to a specified criterion for each element. R. Dymonds's Empathic Inference Index was also administered. Interrater reliability of the empathic communication measure was adequate and a negative relationship was found between this measure and empathic inference. Sex-type differences were noted. The 2 measures apparently reflect different processes.—C. P. McCreary.

1609. Coetzee, A. L. **Making your own personality: Human modelling: A new method in psychotherapy.** Pretoria, South Africa: J. L. Van Schaik, 1974. 222 p.—Describes the technique of human modeling, a method which can be used to overcome deadlocks in psychotherapy, in which the psychotherapist requires the patient to construct a person with his own identity, life experiences, problems, and expectations and then to help this "modeled" person to overcome his problems. Uses of the method for diagnosis and communication are described.

1610. Cox, Richard H. & Esau, Truman G. (United States International U, Program of Marriage, Family & Child Clinical Services) **Regressive therapy: Therapeutic regression of schizophrenic children, adolescents and young adults.** New York, NY: Brunner/Mazel, 1974. xiv, 154 p. \$8.50.

1611. Dlin, Barney M.; Stern, Andrew & Pollakoff, Steven J. (Temple U, Health Sciences Ctr) **Survivors of cardiac arrest: The first few days.** *Psychosomatics*, 1974, Vol 15(2), 61-67.—Discusses the psychological state of patients who have seemingly witnessed their own death.

Most of them recalled their hearts stopping. All were disturbed by the experience. A few continued to believe that they were dead after resuscitation. Such an experience requires psychiatric assistance as well as cooperation of the patient's family and attending medical staff. Patients could put fragmented memories into realistic perspective, thereby relieving the existent fear and confusion. (18 ref)—A. S. Kulkarni.

1612. Dolliver, Robert H. & Woodward, Bruce T. (U Missouri) **Giving and taking in psychotherapy.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 66-70.—Presents a theoretical discussion and review of the difficulties involved in "giving" and "taking" in therapy. Ethical questions about acting in the client's best interest; considerations of loss and gain for the client; and personality characteristics of therapists which influence the way they structure therapy relationships are identified as the major issues.—C. P. McCreary.

1613. Fink, Paul J. (Eastern Virginia Medical School, Norfolk) **Concern about variations in coital frequency.** *Medical Aspects of Human Sexuality*, 1974(Jun), Vol 8(6), 171-172.—Presents a brief guide for counseling patients who evidence a concern about the frequency of sexual intercourse. Specific attention should be directed to the specific complaint about frequency, the nature of the relationship, the intensity of the person's sexual drive, the kind of excuses given for not having sex, and the presence of a specific dysfunction (e.g., premature ejaculation).

1614. Fischer, Roland. (Maryland Psychiatric Research Ctr, Baltimore) **Visions, hallucinations, consciousness, hemispheres, symbols.** *Journal of Altered States of Consciousness*, 1974(Spr), Vol 1(2), 145-151.—The gradual transformation of perceptions into hallucinations (and dreams) on a continuum of increasing central nervous system arousal, impaired reality testing, and preferential right cerebral hemispheric activity is discussed as being relevant to both normal behavior and the realm of clinical psychiatry. The changing interpretation or meaning attached to the words *reality*, *vision*, and *hallucination* illuminates the significance of "vivid audiovisual imagery" in the (therapeutic) process of disintegration and rebirth through symbolic experiences. (23 ref)—*Journal abstract*.

1615. Gillum, Richard F. & Barsky, Arthur J. (National Heart & Lung Inst, Bethesda, MD) **Diagnosis and management of patient noncompliance.** *JAMA: Journal of the American Medical Association*, 1974(Jun), Vol 228(12), 1563-1567.—Considers that patient noncompliance with medical regimens is one of the major unsolved therapeutic problems confronting the medical profession today. Physicians have great difficulty identifying and dealing with noncompliers. A critical review of the literature is presented which indicates that the factors most consistently related to noncompliance are (a) psychological factors, (b) environmental and social factors, (c) characteristics of the therapeutic regimen, and (d) properties of the physician-patient interaction. Based on this information, a strategy for the improved diagnosis and management of noncompliance is feasible. (40 ref)—*Journal abstract*.

1616. Herz, Marvin I. et al. (New York State Psychiatric Inst, Washington Heights Community Serv-

ice, NY) **Individual versus group aftercare treatment.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 808-812.—Tested the relative efficacy of minimal individual contact vs group therapy, given an equal amount of therapist time allocated to each treatment. 144 aftercare patients were randomly assigned to either group or individual therapy conducted by 12 incoming 1st-yr residents. Results at the end of 1 yr showed no significant differences in outcome measures for either group. However, the therapists greatly preferred the group method, and the group patients seemed more enthusiastic about treatment. Greater use of group treatment in aftercare clinics is recommended.—*Journal abstract.*

1617. **Hobson, Robert F. Loneliness.** *Journal of Analytical Psychology*, 1974(Jan), Vol 19(1), 71-89.—Examines the following aspects of loneliness: psychotherapy, the difference between loneliness and aloneness, the language of loneliness, love and loneliness, and friendship and imagination. (26 ref)

1618. **Howells, J. G. & Townsend, D. Puppetry as a medium for play diagnosis.** *Child Psychiatry Quarterly*, 1973(Jan), Vol 6(1), 9-14.—Describes play diagnosis as the discovery through play of clinically interesting facts concerning a child's interpersonal relationships. In puppetry the child is able to present his own side of the picture freely instead of being limited to verbal expression, which he probably finds difficult. Puppets can be used both for diagnosis and as a medium of play therapy for the neurotic child. It is a way for the child to act out his fantasies and aggression through catharsis, and it provides a medium through which support can be offered. Relevant literature on play diagnosis is summarized and the establishment of a puppet theater is described. Case examples are provided.—*R. S. Albin.*

1619. **Kemper, Kattrin A. [Countertransference as the deciding factor in establishing communication with a 3-4 yr old girl.]** (Port) *Estudos de Psicanálise*, 1973, No 6, 21-32.—Records the unusual case of a World War II orphan abandoned in Berlin in 1945. The child, an autistic mute whose estimated age was 3-4 yrs, received psychotherapy utilizing maternal countertransference. A traumatic incident triggering uninhibited maternal emotions from the therapist brought about a breakthrough in verbal communication. Therapy terminated 10 mo later (total duration 16 mo) with typical age-level behavior. (English summary) (23 ref)—*N. T. Pinckney.*

1620. **Lenzner, Abraham S. Psychiatry in the coronary care unit.** *Psychosomatics*, 1974, Vol 15(2), 70-71.—Describes events and efforts leading to the unanimous passing of a resolution by the Academy of Psychosomatic Medicine proposing that a psychiatrist and a psychosocial team be an integral part of the Coronary Care Unit for every patient.

1621. **Levy, Linda L. (U Pennsylvania Hosp) Movement therapy for psychiatric patients.** *American Journal of Occupational Therapy*, 1974(Jul), Vol 28(6), 354-357.—Discusses the developmental approach to treatment of severely disorganized psychotic patients. It is postulated that these patients function at a primal learning stage in which learning takes place through movement, and that this primitive cognitive level must be

transcended before higher-level thought processes can evolve. Movement activities thus assume a role in the preliminary stages of psychiatric rehabilitation. Piaget's learning theory and S. Arieti's developmental postulates are cited.—*Journal abstract.*

1622. **Lopez, Agustin D. (U Oklahoma, Health Sciences Ctr, Oklahoma City) Reflections on psychotherapy.** *Biological Psychology Bulletin*, 1973(Dec), Vol 3(2), 68-74.—Deals broadly with the subject of psychotherapy, presenting a brief historical overview and conceptualization of the term, and a discussion of its current status and significance among other psychiatric directives. The use and misuse, indications and contraindications of this form of therapy are considered.—*Journal abstract.*

1623. **Markowitz, Irving. (Family Service & Child Guidance Ctr, Orange, NJ) The immorality of morality.** *Psychiatric Quarterly*, 1973, Vol 47(4), 559-570.—Considers that many human interactions which are inherently immoral masquerade as morality (e.g., polarization of power in a society; discriminatory religious, legal, and moral codes; control of wealth by families who gained it illegally; and the glorification of some forms of violence). It is argued that immorality also exists in those who deliver mental health services when they preach freedom but practice the "shrinking" of individuals to conform to the standards of an immoral society. True morality relates an individual fairly to his enemies as well as to his friends. Moreover, making all individuals in a society moral does not guarantee the morality of the whole society. It is suggested that the mentally healthy are those who can accept some alienation from the values of society. Psychotherapy must cease to support existing social norms and must support only that conformity necessary for self-preservation.—*B. McLean.*

1624. **McCabe, O. Lee. (Maryland Psychiatric Research Ctr, Baltimore) Psychedelic (LSD) psychotherapy: A case report.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 2-10.—Presents a case history illustrating how LSD-induced peak experiences are used as adjuncts to brief, intensive psychotherapy. A 20-yr-old hospitalized college student gave a phenomenological account of the effects of 2 high doses of LSD. Both clinical observations and psychometric assessment (Minnesota Multiphasic Personality Inventory) showed substantial improvement in the patient's functioning and outlook.—*C. P. McCreary.*

1625. **McDowell, David J. (U Maine, Orono) Ego-building in schizophrenia: Activity treatment of an acute psychotic patient.** *Bulletin of the Menninger Clinic*, 1974(May), Vol 38(3), 257-262.

1626. **Patterson, Lewis E. (Cleveland State U) The strange verbal world.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Jan), Vol 1(2), 95-101.—Discusses ways in which Ctr can be facilitated between white counselors and disadvantaged black students and how the search for equal opportunities for blacks has obscured the importance of individual development. Racist and nonracist modes of counseling behavior are described, and the necessity of eliminating the parent-child relationship between whites and blacks is stressed.

1627. Peles, Uri . (Long Island Jewish—Hillside Medical Ctr. New York, NY) **The extremely inhibited woman.** *Medical Aspects of Human Sexuality*, 1974(Jun), Vol 8(6), 41-52.—Presents a brief guide for physicians who counsel extremely inhibited women in the course of sex therapy, including suggestions for identifying her characteristic type of clothing, body language, and verbal behavior. 8 steps in an appropriate counseling procedure for these patients are described.

1628. Persons, Roy W.; Persons, Marilyn K. & Newmark, Irene . (Antioch Coll, Counseling Ctr) **Perceived helpful therapists' characteristics, client improvements, and sex of therapist and client.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 63-65.—Studied judgments of improved clients who were asked to list the helpful or nonhelpful characteristics of their paraprofessional therapists. Therapists and clients were undergraduates in their late teens and twenties. Women clients rated women therapists as more helpful while men were more responsive to male therapists.

1629. Rosenzweig, Stanley P. & Folman, Rina . (VA Outpatient Clinic, Boston, MA) **Patient and therapist variables affecting premature termination in group psychotherapy.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 76-79.—Contends that previous research has not examined premature termination sufficiently in a multidimensional design. Personality variables and demographic data of 26 male Veterans Administration patients were examined, and the judgments and attitudes of 2 male staff psychologists. Early terminators were defined as patients who left treatment before 16 wks. Education was the only demographic variable that differentiated the groups (remainders were more highly educated). Therapist attitudes and predictions were predictive, but psychological tests failed to differentiate remainders from terminators.—C. P. McCreary.

1630. Schulz, Clarence G. [The place of psychotherapy in the treatment of schizophrenic patients.] (Port) *Estudos de Psicanálise*, 1973, No 6, 9-20.—Summarizes the present situation regarding the treatment of schizophrenia resulting from changes over the past 20 yrs. These changes are of 2 kinds: those occurring outside of psychiatry—i.e., sociological, sociopolitical, and economic changes; and those occurring within psychiatry, including the advent of tranquilizing medications, changes in theory, and changes as a result of clinical observations. The main effect of the interaction of theory and clinical observation has been to emphasize psychotherapy as only 1 aspect of the total treatment of the patient. The development of self-differentiation and object—as conceptual tools in understanding some of the clinical phenomena, the importance of countertransference, and the need to use the patient's positive healthy capacities are discussed.—*Journal summary*.

1631. Snaith, R. P. (Stanley Royal Hosp, Wakefield, England) **A method of psychotherapy based on relaxation techniques.** *British Journal of Psychiatry*, 1974(May), Vol 124, 473-481.—Points out that since genuine therapeutic potential may be found in a variety of techniques with widely differing underlying assump-

tions, the psychotherapist needs to be conversant with many methods and the clinical indications for each. One cure will not fit all. A particular amalgam of behavior therapy, hypnosis, and autogenic training is described which may have diverse applications, as illustrated by 5 cases. The patient is given an explanation of his disorder that he can readily understand, and the process and plan of treatment are explained to him in broad outline. He is assigned an active role in treatment, often with planned exercises, and understands the role of the therapist. Before starting treatment, agreement is reached as to realistic and acceptable goals of symptom relief. It is stressed that confidence in what is being done is more important than minute attention to theory.—R. L. Sulzer.

1632. Steinkirchner, Albert V. **Self psychotherapy: I.** Venice, CA: Aquin, 1974. 159 p. \$1.95.—Presents a program of self-psychotherapy which is based on the technique of "spontaneous introspection," in which the images that appear across the "mind's eye" may be used to consciously relive and resolve conflicts that were formerly held in the unconscious memory. The development of this technique, the procedure of opening emotions, and the effects of self-psychotherapy on development and maturation are described. Both clinical cases and examples from the author's own experiences are included.

1633. Tyler, Leona E. (U Oregon) **Commonalities and distinctions between counseling and psychotherapy.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses academic, traditional, and practical bases for distinguishing counseling from psychotherapy. It is suggested that the movement to define all counseling as psychotherapy has had a beneficial effect upon training in that it has focused attention on the importance of the counselor-client relationship.

1634. Walker, Valerie . (Tavistock Clinic, London, England) **The word association sentence method as a predictor of psychotherapeutic outcome.** *British Journal of Social & Clinical Psychology*, 1974(Jun), Vol 13(2), 219-221.—Investigated whether scores on J. D. Sutherland and H. S. Gill's word association sentence (WAS) method could be used to predict the outcome of therapy for psychiatric clinic patients. Data from Sutherland and Gill's original study (1970) were reanalyzed to show that there was some correspondence between predictions of psychotherapeutic outcome based on psychiatric interviews and predictions based on WAS scores. 12 clinic therapists were then asked to designate patients they considered definite successes or failures, and WAS and Shipley-Institute of Living Scale for Measuring Intellectual Impairment scores from these patients were obtained. Scores of the success group were significantly more "normal" than of the failures; additional data indicate that WAS scores classified 90% of the Ss correctly. Scores of the success group were also significantly different from a nonpatient sample.—L. Gorsev.

1635. Weil, Pierre & Schützenberger, Anne A. [Philobacy, ocnophilia and intrauterine regression systems.] (Port) *Estudos de Psicanálise*, 1973, No 6, 57-76.—Compares M. Balint's concepts of philobacy

and ocnophilia with observations of the intrauterine and birth regression techniques. The "rock and roll" procedure identified with the Esalen Institute is considered to be a regression technique, and the "balance activity" involved repeats the 1st intrauterine ocnophil-objectal relationship in contrast to the child-mother umbilical unity, hypothesizing this as one of the possible origins of the schizophrenic split. (French & English summaries) (15 ref)—*N. T. Pinckney.*

1636. Weiner, Myron F. (U Texas, Southwestern Medical School, Dallas) **The psychotherapeutic impasse.** *Diseases of the Nervous System*, 1974(Jun), Vol 35(6), 258-261.—Discusses the causes of the psychotherapeutic impasse, in which the patient reaches a point of no progress or his psychological state worsens. An impasse can arise when the therapist's treatment goals differ from those of the patient, when the therapy prescribed is inappropriate, when there is failure of rapport, or when an antitherapeutic alliance arises. Countertransference, adverse transference reactions, and transference gratification can also stalemate therapy. For resolution, the cause of the impasse must be diagnosed and the appropriate treatment measure applied. Treatment measures include clarification, confrontation, interpretation, transfer, or some form of splitting the transference. Splitting of the transference is useful in the treatment of severely regressive transference reactions and allows for expression of the hostile feelings which were previously acted out or defended against by regression. Some impasse situations require consultation, ongoing supervision, or therapy for the therapist. —*Journal summary.*

1637. Wenegrat, Anne. **A factor analytic study of the Truax Accurate Empathy Scale.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 48-51.—Investigated the linguistic form of therapist responses in order to define the type of information criteria used by raters in producing Accurate Empathy (AE) scores. 268 tape segments from psychoanalytically oriented sessions conducted by 12 psychology interns with 30 adults were rated separately by 3 undergraduates trained in the use of the AE scale. Interrater  $r$  was .64. 60 tape segments were randomly selected from the total and scored on 22 additional measures of form. AE correlated most significantly with the number of responses in which the therapist makes a statement in a specific manner about the client's emotion. Results of a rotated factor analysis revealed that AE loaded heavily on a factor which seemed to reflect the therapist's assertiveness in approaching his client's emotions. Thus, it appears that raters using the AE scale focus on verbal indications of therapist assertiveness in dealing with client emotions. —*C. P. McCreary.*

1638. Wilson, William P. (Duke U., Medical Center) **Utilization of Christian beliefs in psychotherapy.** *Journal of Psychology & Theology*, 1974(Spr), Vol. 2(2), 125-131.—Past evidence has indicated that strong religious faith has had therapeutic effects on individuals suffering from a variety of problems. It is recommended that Christian beliefs should be used in therapy rather than being ignored or attacked. The treatment of 18 patients with the use of Christian maneuvers of commitment or rededication, confession (uncovering), forgiveness, and

fellowship to supplement conventional psychiatric methods is described. Symptomatic relief was obtained in 16 patients when Christian maneuvers were used. Previous therapy had been unsuccessful in 14 cases. —*Journal abstract.*

### Drug Therapy & Drug Rehabilitation

1639. ———. **Experiment at Coatesville: A study of drinking decisions in a treatment environment.** *Alcohol Health & Research World*, 1973(Spr), Vol 1(1), 14-17.—Conducted a 6-wk investigation with volunteer patients in a closed ward of a Veterans Administration hospital. During weeks 2-5 each patient could either be abstinent or drink 1 or 2 oz alcohol/hr for 12 hrs. The results of follow-up and criteria for determining the patients' self-images in their success or failure are presented.—*H. J. Freudenberger.*

1640. Akiskal, Hagop S.; Beard, James D.; Fink, Robert D. & Knott, David H. (U Tennessee, Medical School, Memphis) **Diuretic-antidepressant combination in alcoholic depressives: Preliminary findings.** *Diseases of the Nervous System*, 1974(May), Vol 35(5), 207-211.—6 patients suffering from primary affective illness and habitual excessive drinking, who had not responded to tricyclic antidepressant and/or electroconvulsive therapy, were treated with a combined diuretic-tricyclic (furosemide-amitriptyline) regimen. The Ss acted as their own control. 2 unipolar and 2 bipolar depressives had complete remissions, while the other 2 Ss with chronic depression showed symptomatic improvement. Implications of sodium retention for the pathogenesis of depression and alcoholism are discussed, and a hypothetical positive feedback system which maintains depression and alcoholism in alcoholic depressives is proposed. (37 ref)—*Journal abstract.*

1641. Amitai, M.; Dickhaut, H. H. & Hasenkopf, P. (Friedberg-Hessen District Burghof-Clinic & Sociopsychiatric Ctr, Bad Nauheim, W Germany) **[Treatment of the withdrawal syndrome of "fixers" (drug abuse by adolescents using injection).]** (Germ) *Nervenarzt*, 1972(Mar), Vol 43(3), 157-160.—Tested the therapeutic possibilities of apomorphine for softening the withdrawal symptoms of 19 17-24 yr old drug-addicted fixers treated at the Nauheim clinic. The doses administered, the time and method of administration, results obtained, and side effects are described. Results of the therapy are said to be very positive, and the side effects—dizziness and vomiting—minor. After 7-8 days of treatment, the apomorphine can be gradually phased out and group-therapy treatment can be initiated. The new treatment method is encouraging and will be continued and expanded.—*T. Fisher.*

1642. Angrist, B.; Lee, H. K. & Gershon, S. (New York U, Medical Center) **The antagonism of amphetamine-induced symptomatology by a neuroleptic.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 817-819.—Haloperidol, a specific blocker of dopamine in the dose used (5 mg intramuscularly), was effective in antagonizing amphetamine-induced symptoms in 8 patients. This finding suggests that dopaminergic mechanisms play an important role in amphetamine psychosis and that these mechanisms may be important in other psychotic states.

1643. Appelt, M. & Floru, L. (Psychiatrische Universitätsklinik Düsseldorf, W Germany) [Clinical experiences with cyproterone acetate: Influence on sexuality.] (Germ) *International Pharmacopsychiatry*, 1974, Vol 9(2), 61-76.—Administered doses of 100-250 mg cyproterone acetate over a period of 6-18 mo to 18 patients suffering from oligophrenia, schizophrenia, or abnormal personality development. The rating scale was developed for the present study, and treatment was always performed with the consent of the patient or his guardian. Cyproterone acetate proved to be an efficient clinical, home, or ambulatory treatment, provided that the patient collaborated with it. Fear of punishment was the main cause why sexually abnormal oligophrenes took cyproterone acetate. Neurotic patients also showed a good response to the treatment. Encouraging results were noted in schizophrenics suffering from sexual delusions as the main symptomatology. (20 ref)—*English abstract*.
1644. Aung, Maung H. (U California, San Diego) **Electroencephalographic activation with methohexital in an epileptic population.** *Diseases of the Nervous System*, 1974(May), Vol 35(5), 246-248.—Presents a study which demonstrates that although methohexital is a safe agent, it is not an effective EEG activator for epileptics. The drug activated only 7% of epileptics with normal records or minimal and nonspecific EEG abnormalities and only 33.3% of epileptics who had previously demonstrated a specific paroxysmal epileptiform discharge in routine recording.
1645. Baloch, N. (Severalls Hosp, Colchester, England) **"Steroid psychosis": A case report.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 545-546.—Reports the case of a 41-yr-old man admitted to a psychiatric hospital exhibiting restlessness, hyperactivity, impaired attention, delusions of grandeur, visual and auditory hallucinations, and other symptoms of organic psychosis. 3 wks prior to admission, he had been taking prednisolone for rheumatoid arthritis. Treatment with chlorpromazine was effective in reducing the "psychosis" symptoms.
1646. Beumont, P. J. et al. (U Cape Town, South Africa) **The effects of phenothiazines on endocrine function: II. Effects in men and post-menopausal women.** *British Journal of Psychiatry*, 1974(May), Vol 124, 420-430.—Conducted a study of 12 schizophrenics on long-term treatment with psychotropic drugs which revealed increased plasma prolactin and suppressed plasma testosterone. It is concluded that the phenothiazines may have selective effects on the hypothalamus and on peripheral glands.
1647. Bender, A. Douglas. (Smith Kline & French Lab, Research & Development Div, Philadelphia, PA) **Pharmacodynamic principles of drug therapy in the aged.** *Journal of the American Geriatrics Society*, 1974(Jul), Vol 22(7), 296-303.—Indicated precautions to be taken when prescribing a therapeutic regimen for the elderly. With aging, functional changes occur in many of the systems that control the way a drug is metabolized and the response that it evokes. Apparently it is these changes which underlie the modified effect seen clinically in geriatric patients. Age tends to reduce and delay the absorption of substances from the gastrointestinal tract, impair and delay drug clearance and excretion by the kidneys, and reduce the rate of enzyme destruction. The plasma half-life of penicillin, digoxin, antipyrine, or phenylbutazone is extended significantly in the aged so that higher circulating concentrations are maintained for longer periods. Other age-related changes influence the effect of a drug once it has combined with its receptor. These include an altered number of receptor sites, a decrease in the transmitter content of affected tissues, an increase in the rigidity of responsive tissues, and an overall decline in homeostatic capability. (72 ref)—*Journal abstract*.
1648. Bergamasco, B.; Chiusano, M. & Asteggiano, G. (Agnelli State Hosp, Neuropsychiatric Div, Pinerolo, Italy) **[Retrospective investigation of treatment of endogenous depressions with Anafranil.]** (Ital) *Acta Neurologica*, 1974(Jan), Vol 29(1), 93-101.—Investigated the effects of Anafranil (chlorimipramine) treatment in 138 episodes of endogenous depression in 107 patients over a 2-yr period. Besides the known antidepressant effect in 84% of the Ss and an anti-anxiety effect in 80%, significant relationships were found between the improvement of depressive episodes and the combined treatment in hospital and at home, the type of follow-up therapy, and the dosage. No difference in improvement could be detected between Ss treated with Anafranil alone and those under combined Anafranil and electroshock therapy. Type, frequency, and severity of side effects were of the same order as those reported in the literature. The interval between depressive episodes, considered in 33 Ss, was not related to the type of depression, to the type of treatment, to dose schedule, or to association with electroshock.—*Journal summary*.
1649. Beumont, P. J. et al. (U Cape Town, South Africa) **The effects of phenothiazines on endocrine function: I. Patients with inappropriate lactation and amenorrhoea.** *British Journal of Psychiatry*, 1974(May), Vol 124, 413-419.—Demonstrated that clinical treatment with phenothiazines and related drugs affects circulating levels of various hormones. This would explain the inappropriate breast secretion and abnormalities of menstruation observed in 15 female psychiatric patients.
1650. Birkmayer, W. & Neumayer, E. (Ludwig Boltzman Inst for Neurochemistry, Vienna, Austria) **[The treatment of Dopa-psychoses with L-Tryptophan.]** (Germ) *Nervenarzt*, 1972(Feb), Vol 43(2), 76-78.—Discusses the levodopa treatment of parkinsonism and the most serious and frequent vegetative, motor, and psychic side effects. The transitory psychotic syndrome following levodopa treatment is described in great detail. 3 case histories are presented in which the psychotic side effects were successfully eliminated by the administration of levotryptophan. It is stated that the great usefulness of levotryptophan treatment of levodopa psychoses lies in the fact that it not only cures the psychotic phase but after the psychic recompensation has been accomplished it also enables the patient to continue with a combined levodopa plus levotryptophan treatment without suffering psychotic side effects.—*T. Fisher*.
1651. Block, C.; Borendal-Jansson, B. & Carlsson, C. (Lillhagen Mental Hosp, Sweden) **A double-blind cross-over comparison between clothiapine and diazepam in the treatment of mental symptoms in chronic alcoholics.** *International Journal of Clinical Pharmacology*,

*Therapy & Toxicology*, 1974(Jun), Vol 9(4), 321-325.—In a double-blind crossover study, clothiapine and diazepam were compared with regard to their effects on anxiety, tension, irritability, and depressive conditions in chronic alcoholics. The duration of treatment was 1 wk with each preparation. In a pilot study, patients were treated with 15 mg of clothiapine 3 times/day and 10 mg of diazepam 3 times/day. These dosages proved to be too high, causing tiredness. In the main trial, 12 patients received 15 mg of clothiapine and 10 mg of diazepam 2 times/day (medium dose) and 10 received 5 mg of both drugs 3 times/day (low dose). The results of global scores on a questionnaire showed that the majority of patients improved with both products. No significant differences between clothiapine and diazepam were observed, and there were no significant side effects.—*Journal abstract*.

1652. **Booker, Harold E.** (U Wisconsin, Ctr for Health Sciences, Epilepsy Ctr, Madison) **Clorazepate dipotassium in the treatment of intractable epilepsy.** *JAMA: Journal of the American Medical Association*, 1974(Jul), Vol 229(5), 552-555.—Administered clorazepate dipotassium to 59 patients whose epileptic seizures were intractable to treatment with standard antiepileptic drugs. Excellent results were obtained in 20 patients, principally those with generalized minor attacks. No benefit was seen in 14 patients with typical psychomotor attacks.

1653. **Burrows, Graham et al.** (U Melbourne, Royal Melbourne Hosp, Vic, Australia) **A sequential trial comparing two plasma levels of nortriptyline.** *Australian & New Zealand Journal of Psychiatry*, 1974(Mar), Vol 8(1), 21-23.—20 pairs of depressed patients matched for age, sex, and severity of depression were treated for 4 wks with nortriptyline so that plasma levels of below 49 ng/ml and above 140 ng/ml were obtained. Pairs of patients were compared with regard to improvement of depression, using a sequential skew restricted design. No significant difference between the 2 treatment regimes was found.—*Journal abstract*.

1654. **Butterworth, Alfred T. & Watts, Robert D.** (East Louisiana State Hosp, Jackson) **Double-blind comparison of thiothixene, trifluoperazine, and placebo in chronic alcoholism.** *Psychosomatics*, 1974, Vol 15(2), 85-87.—Reports improvements in anxious, depressive alcoholics on the Brief Psychiatric Rating Scale (BPRS), the Self-Rating Scale by R. S. Lipman and K. Rickels, W. W. K. Zung's Self-Rating Depression Scale, and Global Evaluation. The 2 active drugs and placebo showed significant pre- to postimprovement on the BPRS. Active drugs appeared superior to placebo on the Lipman-Rickels Scale but there was no significant difference between the 2 drugs. Placebo and thiothixene showed a significant pre- to postimprovement on the Zung Scale, but trifluoperazine did not. On Global Evaluation the drugs were not significantly superior to placebo.—*A. S. Kulkarni*.

1655. **Calderon Narvaez, Guillermo.** (National Autonomous U Mexico, Faculty of Medicine, Mexico City) **Psychiatric concepts in Aztec medicine contained in the 16th century Codex Badianus.** *Foreign Psychiatry*, 1973-1974(Win), Vol 2(4), 93-104.—Describes a manuscript containing information attributed to Aztec physicians, written after the Spanish conquest of Mexico.

Illustrations in color show medicinal plants, and the text describes their use in the treatment of "heat and cold in the head," fractured skull, the fatigue experienced by government administrators, "black blood" (melancholy), epilepsy, fear and faintheartedness, and mental stupor, as well as the narcotic and analgesic properties of some and their use in witchcraft. Remedies also included animal and mineral ingredients. Despite some magical elements, the manuscript gives evidence of a considerable degree of sophistication in medical matters (e.g., 2 forms of epilepsy were recognized which seem to conform to the modern types of petit mal and grand mal). Some of the herbs and treatments remain part of the folk medicine of Mexico today.—*I. Davis*.

1656. **Chase, Thomas N.** (NIH, Clinical Ctr, Neurology Unit, Bethesda, MD) **Fusaric acid in Parkinson's disease.** *Neurology*, 1974(Jul), Vol 24(7), 637-639.—Conducted a single-blind therapeutic trial of fusaric acid in 15 patients with idiopathic parkinsonism. At doses that appeared to modify the central metabolism of both norepinephrine and serotonin (600-1,000 mg), fusaric acid failed to alter the severity of parkinsonism in otherwise untreated patients and had no consistent effect on the ability of levodopa to ameliorate parkinsonian signs or to induce dyskinesias. (25 ref)

1657. **Cohen, Sidney & Dittman, Keith S.** (U California, Neuropsychiatric Inst, Los Angeles) **Gerovital H3 in the treatment of the depressed aging patient.** *Psychosomatics*, 1974, Vol 15(1), 15-19.—Treated 41 depressed, aging Ss showing lack of energy, impotence, insomnia, memory impairment, and pain and discomfort from chronic illnesses such as arthritis. Some were psychiatrically normal, 17 had psychiatric symptoms, and 7 were classified as medical. Dosage was 100-200 mg 3 times/wk intramuscularly for 4 wks, a total of 12 injections. Psychiatric interview, a mood scale, and a modified Zung depression scale were used to evaluate improvements. 85% of the Ss reported some improvement. Response was prompt and dramatic but it was mainly subjective. Most patients reported a greater sense of well-being and relaxation and slept better at night. Many obtained some relief of depression. Of the 9 cases showing hypercholesterolemia, 8 showed a lowering of blood cholesterol. Relief of chronic pain was reported by the medical patients suffering from arthritis, multiple sclerosis, Parkinson's disease, or Reiter's syndrome. In 1 case, muscular aches and lightheadedness were reported and in another, depression; both of these Ss were apprehensive and unhappy. 1 other S reported dry mouth.—*A. S. Kulkarni*.

1658. **DeFlaum, Robert B. & Boniface, Kay.** (Narcotics Addict Rehabilitation Act Program, Cincinnati, OH) **The role of a NARA counselor.** *Journal of Applied Rehabilitation Counseling*, 1974(Sum), Vol 5(2), 87-91.

—Discusses the multiple roles that a Narcotics Addict Rehabilitation Act (NARA) counselor must fulfill in relationship to his clients. Although these roles are largely positive (therapist, provider, and intermediary), certain negative (e.g., authority) components may result in an ambivalent counselor-client relationship.

1659. **Donlon, Patrick T. & Rada, Richard T.** (U California, Davis) **High dosage piperacetazine (Quide) in ambulatory schizophrenic patients: Therapeutic**

**efficacy and toxicity.** *Diseases of the Nervous System*, 1974(May), Vol 35(5), 231-236.—Notes that although indications for high-dosage neuroleptics have become increasingly more debatable with recent emphasis on outpatient community management of the severely ill schizophrenic patient, early studies suggest that high-dose neuroleptics have greater effectiveness with some schizophrenic patients while remaining low in toxicity. As part of the present rater-blind study, 16 patients with the diagnosis of either chronic undifferentiated or chronic paranoid schizophrenia were placed on a standard dose of piperacetazine following a washout period. The dosage was then gradually increased until the S achieved maximal effect with a minimum of side effects. 8 Ss required the standard dose (25-160 mg/day) while the remaining 8 required a high dose (160-400 mg/day). The 2 clinical groups were compared for therapeutic efficacy and toxicity. High-dose piperacetazine was found to be effective in 7 Ss refractory to low dosage. Although the incidence of side effects was higher with the high-dose Ss, toxicity (liver, blood, and renal) was not increased in Ss requiring high-dose medication. Indications for high-dose neuroleptics are briefly discussed. (17 ref)—*Journal summary*.

1660. **Donnelly, Edward F. & Chase, Thomas N.** (NIMH, Bethesda, MD) **Intellectual and memory function in parkinsonian and non-parkinsonian patients treated with L-dopa.** *Diseases of the Nervous System*, 1973(Feb), Vol 34(2), 119-123.—13 parkinsonian patients and 9 patients with other central nervous system disorders, hospitalized for therapeutic trials of levodopa, completed the Wechsler Adult Intelligence Scale and the Wechsler Memory Scale during an initial period of placebo administration and again after about 1 mo of drug treatment. There was a significant increase in Full Scale IQ, reflecting a marked rise in Performance IQ and a lesser gain in Verbal IQ. The memory quotient (MQ) was also substantially augmented. Psychological test results for the parkinsonian patients did not differ significantly from those obtained from the nonparkinsonian patients. Results from parkinsonian patients, retested a 2nd time after an average of 17 mo of continuous levodopa treatment, were similar to those found at the time of the 1st retest. No correlation could be discerned between degree of motor change and amount of IQ or MQ increment. Data support the contention that the influence of test-retest artifact cannot be excluded as the major determinant for the reported improvement in intellectual and memory functioning attending levodopa treatment. (15 ref)—*Journal summary*.

1661. **Flemenbaum, Abraham**. (Texas Tech U, Medical School) **Does lithium block the effects of amphetamine? A report of three cases.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 820-821.—Presents 3 reports supporting the hypothesis that lithium therapy inhibits the effect of amphetamine. It is suggested that the pharmacologic mechanisms of action of lithium and amphetamine are directly opposite and that lithium could be prophylactic for cases of amphetamine abuse.

1662. **Frances, Allen**. (Fort Jackson, Columbia, SC) **A comprehensive military drug and alcohol program.**

*International Journal of the Addictions*, 1974, Vol 9(1), 137-144.—Describes one of the US Army's drug and alcohol rehabilitation programs located at Fort Jackson, South Carolina. The physical plant, specific services, goals of rehabilitation, community relations programs, staff training, and rationale of the center are discussed, and comparisons with civilian drug abuse treatment facilities are presented.

1663. **Freeman, Joseph T.** **Some principles of medication in geriatrics.** *Journal of the American Geriatrics Society*, 1974(Jul), Vol 22(7), 289-295.—Discusses the special problems of medication of the elderly. Inappropriate and incorrect use of drugs is reflected in a higher percentage of untoward effects than with younger patients. Most reactions are identified readily but some are lost in the induced disturbances of physiologic balance that occur more readily in the aged. Improper dosage, injudicious methods of administration, and lack of awareness of drug interactions are common and are associated with failure to quantitate the reactive capacities of aging body resources. The paucity of didactic instruction and the difficulty for aged patients of observing a medical regimen add to the problems of therapy. Because aging alters drug effects and drug effects alter senescent functions, the physician must be familiar with confirmed pharmacologic data. Medication schedules must be in line with recognized levels of normality in senescence. These precautions will reduce the chances of initiating primary or sequential mishaps when drugs are administered to the elderly. (19 ref)—*Journal abstract*.

1664. **Glick, Burton S.** **Comparison of doxepin and thioridazine in outpatients.** *Diseases of the Nervous System*, 1973(Jan), Vol 34(1), 37-39.

1665. **Gottheil, Edward; Crawford, Harold D. & Cornelison, Floyd S.** (Jefferson Medical Coll., Philadelphia, Pa.) **The alcoholic's ability to resist available alcohol.** *Diseases of the Nervous System*, 1973(Feb), Vol 34(2), 80-84.—Studied and treated volunteer alcoholic patients during a 4-wk experimental program where they could elect to drink 0, 1, or 2 oz of 80 proof ethyl alcohol each hour on the hour from 9:00 AM to 9:00 PM on Monday through Friday. Of 45 patients, 19 did not drink at all, 12 began drinking and stopped, and 14 drank throughout the program. Historical information and weekly scores on discomfort, sleep disturbance, self-esteem, and withdrawal of 4 cases who were able to stop drinking while on the program are described. There was little support for the concepts of "craving" or "loss of control." The patients did not drink all of the alcohol available, they voluntarily stopped drinking while others continued, and they did not show more discomfort, sleep disturbance, withdrawal, and lowered self-esteem after they stopped drinking. Observations during the program of drinking behavior in relation to interpersonal relationships and personality variables were more consistent with outcome at a 6-mo follow-up than were historical data or expressed motivation. (21 ref)—*Journal summary*.

1666. **Gram, Lars F.; Overo, Kerstin F. & Kirk, Lars**. (Psychochemistry Inst, Copenhagen, Denmark) **Influence of neuroleptics and benzodiazepines on metabolism of tricyclic antidepressants in man.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 863-866.

—Tested the pharmacokinetic interaction between benzodiazepines and nortriptyline in 54–60 yr old female schizophrenics. Each patient was tested during 2 series of 3 tests for 6 mo with neuroleptics, diazepam, and chlorthalidopoxide, and in a drug-free control period. Neuroleptics (haloperidol and perphenazine) caused changes indicating inhibition of metabolism of <sup>14</sup>C-nortriptyline. Neither of the 2 benzodiazepines caused a significant change in the pharmacokinetic measurements of <sup>14</sup>C-nortriptyline. In 21 male Wistar rats, the metabolism of <sup>14</sup>C-nortriptyline was inhibited by pretreatment with chlorthalidopoxide, but only when given in a dose of 60 mg/kg a short time before the administration of <sup>14</sup>C-nortriptyline. (16 ref)—*Journal abstract*.

1667. Greenblatt, David J.; Koch-Weser, Jan & Shader, Richard I. (Massachusetts General Hosp, Clinical Pharmacology Unit, Boston) **Multiple complications and death following protriptyline overdose.** *JAMA: Journal of the American Medical Association*, 1974(Jul), Vol 229(5), 556–557.—Presents the first published case of fatal protriptyline hydrochloride (Vivactyl) poisoning in a 28-yr-old man who had been taking the drug for depression. Complications included repetitive grand mal epileptic seizures, decreased body temperature, sinus tachycardia, and hypotension. Death occurred within 30 hrs after admission.

1668. Haase, H. J.; Floru, L. & Ulrich, F. (Psychiatrische Universitätsklinik Düsseldorf, W Germany) [A clinical-neuroleptic study of N-[(1-äthyl-pyrrolidin-2-yl)-methyl]-2-methoxy-5-sulfamoyl-benzamid-neuroleptikums sulpirid (Dogmatil) in acute schizophrenia cases.] (Germ) *International Pharmacopsychiatry*, 1974, Vol 9(2), 77–94.—Treated 26 acute, 1st-time, or repeatedly disordered schizophrenic patients with sulpiride in a psychiatric ward using a single-blind technique. Results show that sulpiride (200 mg/day) had a mood-clearing and stimulating effect. The average dose necessary to reach the neuroleptic threshold was 399 mg. An average dose of 593.3 mg daily produced, in an average time of 11.5 days, an evident antipsychotic effect. A good indication for sulpiride therapy seemed to be the inhibited and withdrawn patients, but the restless, highly productive psychotic cases also showed good results. Extrapyramidal side effects were slight and could easily be kept under control. Only a certain drowsiness after very high doses was registered. (25 ref)—*English abstract*.

1669. Hurtig, Howard L. & Dyson, William L. (U Pennsylvania) **Lithium toxicity enhanced by diuresis.** *New England Journal of Medicine*, 1974(Mar), Vol 290(13), 748–749.—Presents the case of a 72-yr-old manic depressive woman who showed lithium toxicity after years of successful lithium treatment, in support of the contention that it is important to adjust lithium carbonate dosage in patients whose sodium intake and excretion patterns change for some reason.

1670. Isenberg, Phillip L.; Mahnke, Mark W. & Shields, Walker E. (McLean Hosp, Outpatient Clinic, Belmont, MA) **Medication groups for continuing care.** *Hospital & Community Psychiatry*, 1974(Aug), Vol 25(8), 517–519.—Describes an outpatient clinic in a community setting which uses medication groups to monitor and improve the effectiveness of psychotropic drugs adminis-

tered to chronic patients with strong dependency needs. The functions of the psychiatric resident, staff nurse, intake team, and group members are discussed, and 3 case histories are presented.

1671. Jacobson, Gary; Baldessarini, Ross J. & Manschreck, Theo. (Massachusetts General Hosp, Eric Lindemann Mental Health Ctr, Boston) **Tardive and withdrawal dyskinesia associated with haloperidol.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 910–913.—Reports 4 cases of dyskinesia attributable to treatment with 4–20 mg of haloperidol daily for more than 1 yr. 2 cases involved temporary oral-facial dyskinesias and the others a more persistent complex mixture of neurological features. The possibility that tardive dyskinesia may be associated with the butyrophenones in addition to other antipsychotic agents should be considered. (29 ref)

1672. Kerry, R. J.; McDermott, C. M. & Orme, J. E. (Northern General Hosp, Sheffield, England) **Bromazepam, medazepam, chlorthalidopoxide in treatment of neurotic anxiety.** *British Journal of Psychiatry*, 1974(May), Vol 124, 485–486.—Evaluated a new benzodiazepine, bromazepam, used with outpatients. Such tests of new tranquilizers are difficult, often in the past having produced initial enthusiasm followed by disappointment. Results were highly variable between patients, suggesting that phobics may respond best to medazepam or bromazepam, while chlorthalidopoxide may be less successful.

1673. Klerman, Gerald L. (Harvard U, Medical School, Boston) **Pharmacotherapy of schizophrenia.** *Annual Review of Medicine*, 1974, Vol 25, 199–217.—Reviews classes of compounds currently used in the pharmacotherapy of schizophrenia. 3 are of major importance and are treated in detail: the phenothiazines, thioxanthenes, and butyrophenones, with the emphasis on the 1st group, since these compounds are the most numerous and most widely used. The general finding to date is that among the 3 major classes the therapeutic similarities are greater than the differences. Adverse effects of the drugs, their modes of action, and their effects on the extrapyramidal nervous system and dopamine metabolism are summarized. The prediction is made that although these drugs are only palliative, they will be used increasingly in years to come, with treatment shifting further from hospitals to the community. Greater evaluational and methodological sophistication is also forecast. (40 ref)—*B. Gurel*.

1674. Koufen, H. & Conbruch, Ursula. (U Freiburg, Psychiatric & Neuroclinic, W Germany) [Lithium intoxication: Study of 6 cases.] (Germ) *Nervenarzt*, 1972(Mar), Vol 43(3), 145–152.—Examined the records of 846 patients who received lithium therapy, 1968–1971, to study the side effects of lithium intoxication. Only 14 Ss had excessive lithium levels and only 6 of the 14 (4 women and 2 men) had symptoms of acute intoxication with consciousness disturbances and amnesic intervals of 1–4 wks. In 5 of these cases lithium treatment had to be abandoned completely and in 1 decreased dosage was sufficient to eliminate the intoxication. After treatment and cure of the acute, delirious-soporific and hyperkinetic stages, there were no noticeable permanent side effects other than a temporary (up to 3 mo) syndrome in

combination with gradual normalization of the slowed-down basic EEG frequency. Only 1 S required a longer treatment for cerebral-ataxic disturbances. (43 ref)—*T. Fisher.*

1675. **Leuner, Hanscarl.** (U Göttingen, Psychiatric Clinic, W Germany) [**Acute psychiatric complications due to drug abuse, and their treatment.**] (*Germ Nervenarzt*, 1972(Mar), Vol 43(3), 142-145.—Reports on drug abuse by adolescents and the consequent acute toxic complications, posttoxic psychoses, and postpsychotic syndromes. The symptoms and their treatment are described. The treatment of these acute, mostly psychotic disturbances in juvenile drug abusers is reported to be relatively simple and the prognosis favorable. (16 ref)

1676. **Looney, Maryanne & Metcalf, Suzanne.** (Hall-Brooke Hosp, Westport, CT) **The "fatigue factor" in drug addiction: Insufficient motivation for treatment.** *Hospital & Community Psychiatry*, 1974(Aug), Vol 25(8), 528-530.—Describes the "fatigue factor," the physical and emotional exhaustion often reported by drug addicts as resulting from the pressures of their addiction. Although such internal motivation has been highly valued by psychotherapists, data from the authors' 2-yr experience in a drug treatment program suggests that it rarely leads to successful treatment unless it is supplemented by external pressures from families and the courts.

1677. **Malpas, Ann; Legg, N. J. & Scott, D. F.** (London Hosp, Medical Coll, England) **Effects of hypnotics on anxious patients.** *British Journal of Psychiatry*, 1974(May), Vol 124, 482-484.—Conducted tests to determine the persistence of effects from a 7-day course of hypnotic drugs. The EEG, digit symbol substitution and card sorting tasks, and ratings of symptoms using the visual analogue scale were repeated. Overall, the sedative effects seemed to be less persistent with these anxious female outpatients than with a previous group of normals. Patients consistently rated their symptoms worse than did the psychiatrist.—*R. L. Sulzer.*

1678. **Man, Pang L.** (Northville State Hosp, MI) **Long-term effects of haloperidol.** *Diseases of the Nervous System*, 1973(Feb), Vol 34(2), 113-118.—An attempt was made to evaluate the effectiveness of haloperidol in 64 acutely ill hospitalized psychotics and to determine the optimal dosage, incidence of side effects, control measures, and long-term effects. All patients were rated periodically with the Ward Behavior Rating Scale and the Brief Psychiatric Rating Scale and were interviewed daily to determine individual dosage adjustment. The starting dosage was 2 mg or 5 mg 3 times/day, and dosage was increased if the patient did not improve. Final dosages ranged from 2 mg to 145 mg daily. As a result of treatment, 59 patients were discharged. These Ss were followed-up for a 2-yr period in a haloperidol outpatient clinic. It was found that acute paranoid and manic patients improved considerably, whereas chronic patients improved less. Readmission rate over the 2 yrs was 17.3%. A positive relationship was found between the development of extrapyramidal symptoms and improvement. No abnormalities in blood chemistry or other laboratory tests were found.—*Journal summary.*

1679. **Maskin, Michael B.; Riklan, Manuel & Chabot, David.** (California State Coll, San Bernardino) **Effects of**

**"short-term" versus "long-term" L-dopa therapy in parkinsonism on critical flicker frequency.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 455-458.—Investigated short- and long-range effects of levodopa (L-dopa) therapy in parkinsonism on critical flicker frequency (CFF) scores. 3 equated groups, each of 15 Ss, were selected: short-term and long-term L-dopa patients and a control group. Binocular CFF thresholds were obtained twice for each S. The control group scored significantly higher on CFF than either of the L-dopa groups, indicating superior neural integration. The short-term L-dopa Ss scored significantly higher than the long-term Ss, demonstrating better cerebral efficiency. The evidence suggests that a peculiar clinical state interfering with neural transmission may develop in parkinsonian patients on L-dopa therapy prolonged 2 yrs or more.—*Journal abstract.*

1680. **Mauro, A. L. & Shapiro, M.** (Misericordia-Fordham Hosp, Bronx, NY) **A double-blind study to assess the efficacy of oral tilidine hydrochloride (W5759A) among a group of post-operative orthopedic and trauma patients.** *Current Therapeutic Research*, 1974(Jul), Vol 16(7), 725-733.—Administered a single oral dose of 50 mg tilidine to 25 hospitalized postoperative orthopedic and/or trauma patients experiencing moderate to severe pain. 24 additional patients were given a single dose of placebo and 26 others a single dose of 100 mg of meperidine. Analysis of data indicates tilidine analgesic activity in moderate to severe pain comparable to meperidine. Both drug groups showed a higher incidence of pain relief than with placebo, the greatest difference occurring  $\frac{1}{2}$  hr after medication. The difference between tilidine and placebo at  $\frac{1}{2}$  hr could be considered "possibly significant" ( $p < .06$ ). Principle side effects occurring in all groups were drowsiness, lightheadedness, and headaches. There were no significant differences between groups in terms of side effects, blood pressure, and pulse. There were no significant changes or trends in laboratory data.—*Journal abstract.*

1681. **Miller, Jerome S.; Sensenig, John & Raymond, Jonathan S.** (NIDA Clinical Research Ctr, Lexington, KY) **Value structure as a predictor of type of discharge among residential addicts.** *International Journal of the Addictions*, 1974, Vol 9(1), 127-136.—Compared scores on the Rokeach Value Survey among 125 addicts categorized as not suitable for treatment (NST) in a drug research and treatment clinic, 28 elopee addicts (i.e., those who independently chose to leave the program), 49 addicts not suitable for aftercare (NSAC), and 89 addicts suitable for aftercare (AC). The largest number of significantly differing values occurred between the NST and the AC groups; in general the AC group reported more concern with values related to self-understanding, inner direction, and task orientation, while the NST group was more concerned with values only superficially related to treatment (e.g., "polite," "clean," and "obedient"). There were no significant differences between the NST and NSAC groups. Data (a) indicate a definite progression from a hedonistic, carefree pattern of values among the NST and NSAC groups to a serious-minded, task-oriented pattern of values and priorities in the AC group; and (b) suggest the use of values assessment as predictors of addicts' response to treatment.—*L. Gorsej.*

1682. Moffett, Arthur D.; Bruce, James D. & Horvitz, Diana. (Medical Coll Pennsylvania, Section on Drug & Alcohol Abuse) **New ways of treating addicts.** *Social Work*, 1974(Jul), Vol 19(4), 389-396.—Discusses the need for redefining social work goals in treating drug addicts and bridging the "perceptual gap" between traditional treatment and the needs of the addicts. Eliminating the idea that rehabilitation is synonymous with abstinence and that reliance on a drug is incompatible with progress may be the first step in facilitating communication between social workers and addicts. Implications for social work training programs are discussed. (24 ref)
1683. Neff, N. H. & Yang, H. Y. (NIMH, St Elizabeths Hosp, Lab of Preclinical Pharmacology, Washington, DC) **Another look at the monoamine oxidases and the monoamine oxidase inhibitor drugs.** *Life Sciences*, 1974(Jun), Vol 14(11), 2061-2074.—Reviews the literature which discusses the possible mechanisms of action of monoamine oxidase (MAO) inhibitor drugs and the implications of these drugs for the treatment of hypertension and depression. The facts (a) that there are multiple forms of MAO which metabolize different amines and (b) that sympathetic neurons contain Type A enzyme, are essential factors to be considered in therapy. (60 ref)
1684. Ossofsky, Helen J. **Amenorrhea in endogenous depression.** *International Pharmacopsychiatry*, 1974, Vol 9(2), 100-108.—Details the cases of 5 patients in whom reproductive abnormalities and depression were both reversed with imipramine. It is noted that, although much clinical and experimental work lies ahead before the relationship of hypothalamic hormones and depression is understood, current research pertaining to hypothalamic releasing factors provides clues which fit well with both clinical observations and current theories regarding a neuroendocrinological pathogenesis of depression. It is suggested that gross menstrual irregularities in a healthy woman are often pathognomonic for endogenous depression. (15 ref) —*Journal abstract.*
1685. Pearce, Larry A. & Waterbury, L. David. (Wake Forest U, Bowman Gray School of Medicine) **L-methionine: A possible levodopa antagonist.** *Neurology*, 1974(Jul), Vol 24(7), 640-641.—Placed 14 patients under treatment with levodopa for idiopathic Parkinson's disease on a restricted methionine diet, 5 gm daily, for 8 days. Levomethionine, 1.5 gm 3 times/day, or placebo (lactose) was administered in a randomized, double-blind technique to 7 patients. 7 Ss on the low methionine regimen received placebo and 3 subjectively improved. 5 of 7 receiving a high methionine intake became worse. One patient exhibited a hypersexual, aggressive behavior without changes in clinical signs, and another became severely depressed. Patients regressed in gait, bradykinesia, tremor, and rigidity but returned to baseline when levomethionine was discontinued. One patient deteriorated rapidly to a state even worse than that before levodopa therapy. It is concluded that levomethionine may reverse the clinical effectiveness of levodopa in parkinsonism.—*Journal abstract.*
1686. Perkins, Richard & Hinton, John. (London Hosp, England) **Sedative or tranquilizer? A comparison of the hypnotic effects of chlordiazepoxide and amylobarbitone sodium.** *British Journal of Psychiatry*, 1974(May), Vol 124, 435-439.—At the doses at which the 2 drugs have been found equally effective in relieving anxiety, chlordiazepoxide was less effective than amylobarbitone sodium in promoting sleep. Moreover, increased dosage did not depress consciousness or reduce rapid eye movement sleep as would increased barbiturate doses. Earlier work has indicated overlapping actions of the drugs, barbiturates acting primarily in the reticular formation and benzodiazepines mainly in the hippocampus.—R. L. Sulzer.
1687. Raynes, A. E.; Climent, C.; Patch, V. D. & Ervin, F. (Boston Dept of Health and Hospitals, MA) **Factors related to imprisonment in female heroin addicts.** *International Journal of the Addictions*, 1974, Vol 9(1), 145-150.—Presents family history, demographic, drug use, and employment data for 46 female narcotics addicts currently at a Massachusetts correctional institution for drug-related offenses. Comparisons are made with data from 49 female addicts who voluntarily entered a hospital detoxification program.
1688. Rickels, Karl et al. (U Pennsylvania) **The Self-Rating Depression Scale (SDS) as a measure of psychotropic drug response.** *Diseases of the Nervous System*, 1973(Feb), Vol 34(2), 98-104.—Factor analysis of the SDS scores of 831 depressed outpatients yielded 4 factors: Retarded Depression, Anxious Depression, Appetite Disturbance, and Performance Difficulty. To assess the sensitivity of the newly derived SDS factors, data from 3 antidepressant drug studies with a total of 300 patients were subjected to analyses of covariance yielding main drug effects for (a) the SDS factors and total score and (b) the Physician Depression Scale (PDS) clusters and total score. In 2 of the 3 studies, the PDS proved more sensitive to drug effects than either the SDS factors or total score. In Study 3, however, the PDS was considerably less sensitive than the SDS, and main drug effects were particularly marked in the SDS Retarded Depression and Performance Difficulty factors. This discrepant result may have reflected the fact that a stimulatory agent (methylphenidate) was used in Study 3, whereas Studies 1 and 2 involved purely antidepressant agents (e.g., amitriptyline). In addition, Study 3 included only private practice patients; greater sensitivity of the SDS has previously been observed in private patients compared to clinic patients. It is hypothesized that patients in lower socioeconomic classes are likely to encounter reality-based and attitudinal obstacles to reporting change on health-oriented items. (16 ref) —*Journal summary.*
1689. Rickels, Karl & Downing, Robert W. (U Pennsylvania) **Predicting relief from anxiety with phenobarbital.** *Psychosomatics*, 1974, Vol 15(1), 30-34.—Compared placebo to phenobarbital in a 4-wk double-blind placebo controlled trial with 183 anxious, neurotic patients. Phenobarbital induced significantly more improvement than placebo. (18 ref)
1690. Roman, Yoram M.; Pinto, Michael & Gay, George R. (Haight-Ashbury Free Medical Clinic, San Francisco, CA) **Rites of passage: A ritual of detoxification.** *Journal of Altered States of Consciousness*, 1973(Fal), Vol 1(1), 81-92.—In the authors' extensive work with

heroin addicts, it was observed that the rituals associated with heroin became an integral part of the usage. A method of ritualistic detoxification through ceremonies called "rites of passage" is outlined. This method offers to the ritual-oriented addict a place and time where he can detoxify without any medication, but instead through special detoxification rituals designed to replace the heroin rituals. Participants undergo 6 days of rituals and ceremonies and simultaneous individual and group therapy.—*Journal abstract.*

1691. Ruben, Harvey L. (Connecticut Mental Health Ctr, New Haven) **Rehabilitation of drug and alcohol abusers in the U.S. Army.** *International Journal of the Addictions*, 1974, Vol 9(1), 41-55.—Reviews guidelines developed by the US Army for the establishment of rehabilitation programs for drug and alcohol abuse and methods of program evaluation. Various types of actual programs are described, including halfway houses, Alcoholics Anonymous groups, and groups based on behavior modification principles. It is concluded that civilian programs can benefit from the Army's experiences, because in spite of various difficulties, the programs have generally been successful.

1692. Rutigliano, G.; Chieppa, M. & Leonetti, S. (U Bari, Inst of Psychiatric Clinic, Italy) **[Comparison between the excretion curves of two lithium salts preparations: Carbonate and "slow release" sulphate.]** (Ital) *Acta Neurologica*, 1974(Jan), Vol 29(1), 77-92.—Studied 2 groups of 14 patients each, of both sexes and various ages. Higher concentrations of lithium serum persisted longer after ingestion of the sulphate than the carbonate. (32 ref)

1693. Saarma, J.; Saarma, M.; Sild, L. & Tikk, P. (Tartu State U, Lab of Psychopharmacology, USSR) **Effects of thiothixene upon the higher nervous activity in chronic schizophrenics.** *International Pharmacopsychiatry*, 1974, Vol 9(2), 109-117.—Used a battery of 6 tests reflecting higher nervous activity (HNA), and a psychiatric rating scale, to assess the clinical effects of thiothixene and its action upon HNA in 22 chronic schizophrenic inpatients (mean duration of the disease 9.6 yrs). 3 patients showed good results, and in 9 patients there was a moderate, clinical improvement. There was a marked improvement of the stability of excitatory process, of the equilibrium of excitatory and inhibitory processes, and of internal inhibitions in these patients. Some of the HNA parameters reflecting the intensity of trans marginal inhibition were of prognostic value. (26 ref)—*Journal abstract.*

1694. Salvadorini, F.; Saba, P.; Galeone, F. & Tognetti, G. (Volterra Interprovincial Psychiatric Hosp, Pisa, Italy) **[Gonadotropic anterior pituitary activity in subjects with mongolism (Langdon-Down syndrome).]** (Ital) *Acta Neurologica*, 1974(Jan), Vol 29(1), 73-76.—Employed 5 male mongoloids 18-42 yrs old as Ss in a study of the bioanthropologic deficit that accompanies the clinical picture of the Langdon-Down syndrome. Gonadotropic activity was investigated by the radio-immunologic method in blood samples taken in the morning and at various intervals after the administration of levodopa. It is concluded from this small sample that the gonadotropic anterior pituitary hypofunction is not

an essential and constant element of the Langdon-Down syndrome. (15 ref)—*M. J. Stanford.*

1695. Savage, Charles; McCabe, O. Lee; Kurland, Albert A. & Hanlon, Thomas. (VA Hosp, Baltimore, MD) **LSD-assisted psychotherapy in the treatment of severe chronic neurosis.** *Journal of Altered States of Consciousness*, 1973(Fal), Vol 1(1), 31-47.—Assessed the overall effectiveness of LSD therapy vs conventional institutional treatment of 96 chronic, severe neurotics. Within the LSD model, the relative effectiveness of a high vs low dose administration was also assessed. Data suggest that LSD therapy, particularly that involving high dose, had a superior short-term impact over conventional treatment in terms of objective adjustment criteria. Except for certain sex-dosage factors, differential long-term effects were either negligible or inconclusive. (40 ref)—*Journal abstract.*

1696. Sbarbaro, V. (Main General Hosp, Neurological Div, Verona, Italy) **[Electroclinical effects of taurine in some epileptic patients: Preliminary results.]** (Ital) *Acta Neurologica*, 1974(Jan), Vol 29(1), 33-37.—Followed up the research by Derouaux, Puil, and Naquet with patients with different forms of epilepsy. 13 Ss were given 300 mg/kg of taurine by phlebotomy and 7 received 100 mg/kg daily. EEG results, clinical data, and subjective reports by the patients were used to evaluate treatment effects. Because of the preliminary nature of the results no statistical analysis was attempted. Although it is believed that taurine is effective, particularly in generalized photosensitive epilepsy and temporal epilepsy, it would be premature to speak of it as an antiepileptic drug.—*M. J. Stanford.*

1697. Serafetinides, E. A.; Willis, D. & Clark, M. L. (VA Hosp, Brentwood, CA) **The EEG effects of zinc in geriatric psychiatric patients.** *International Pharmacopsychiatry*, 1974, Vol 9(2), 95-99.—Conducted EEG studies in 24 geriatric psychiatric inpatients who participated in a double-blind, placebo-controlled trial of zinc. It was found that medication as such was associated with no obvious EEG differences. On the other hand, patients could be differentiated on the basis of slow rhythms present. Great abundance of slow EEG rhythms was associated with mental deterioration of an organic type, whereas better-scoring patients had more normal-looking EEGs.—*Journal abstract.*

1698. Silsby, Harry & Tennant, Forest S. **Short-term, ambulatory detoxification of opiate addicts using methadone.** *International Journal of the Addictions*, 1974, Vol 9(1), 167-170.—21 young opiate addicts entered an ambulatory, low-dose methadone detoxification program which lasted 7 days. 8 (38%) did not successfully complete detoxification. At the end of 6 mo only 2 (9.5%) addicts were free of opiate drugs. The high relapse rate indicates that this procedure should only be attempted with selected, motivated individuals.

1699. Spring, Carl; Greenberg, Lawrence; Scott, Jimmy & Hopwood, John. (U California, Davis) **Electrodermal activity in hyperactive boys who are methylphenidate responders.** *Psychophysiology*, 1974(Jul), Vol 11(4), 436-442.—Randomly divided 9-10 yr old hyperactive males into 2 groups. In Group 1 ( $n = 18$ ) methylphenidate was withheld for 72 hrs before testing. 20 Ss in Group 2 continued to take their

usual daily doses of methylphenidate. 20 normal matched controls formed Group 3. Electrodermal measures (i.e., basal resistance, frequency of nonspecific responses, specific response amplitude to an auditory signal, and number of trials to habituation) were taken. Normal and off-drug groups differed significantly on specific response amplitude and trials to habituation, and difference in nonspecific responses approached significance. Off-drug and on-drug hyperactive groups differed significantly on frequency of nonspecific responses, and difference in trials to habituation approached significance. These differences indicate lower reactivity in the off-drug hyperactive group.—*Journal abstract.*

1700. Vista Hill Psychiatric Foundation. (San Diego, CA) **Alternatives to adolescent drug abuse.** *Drug Abuse & Alcoholism Newsletter*, 1974(May), Vol 3(3), 4 p.

—Considers that the selection of appropriate alternative activities in drug rehabilitation requires the individual's active participation and meaningful interest in, and attraction to, these activities. Several psychological alternatives to the drug experience are described, including physical, sensory, psychological, and interpersonal awareness; learning; aesthetic appreciation; and social and political activism. It is stressed that successful alternatives will not be accomplished by a passive, spectator-type involvement. Alternative options can be used early to prevent heavy involvement in drugs as well as later to offer the person a new life-style or more varied leisure opportunities.—*Journal summary.*

1701. Vista Hill Psychiatric Foundation. (San Diego, CA) **Heroin maintenance: A solution or a problem?** *Drug Abuse & Alcoholism Newsletter*, 1974(Jul), Vol 3(4), 4 p.—Discusses arguments for and against heroin maintenance programs (i.e., providing or administering heroin to long-term addicts who have been failures in other treatment programs). Several different perspectives on this issue are noted, including those of legislators, drug treatment facility administrators, and those who believe that a person has a right to take whatever drug he wishes. The British system of heroin maintenance is described, and data which indicate that it has not been successful in reducing the number of addicts or the number of illicit drug sales are presented. Possible indications for a heroin maintenance program are considered, although it is concluded that a large scale maintenance program in the US could be catastrophic and that other treatment options should be developed instead.—*L. Gorsev.*

1702. Werry, John S. & Sprague, Robert L. (U Auckland, School of Medicine, New Zealand) **Methylphenidate in children: Effect of dosage.** *Australian & New Zealand Journal of Psychiatry*, 1974(Mar), Vol 8(1), 9-19.—Results of a clinical trial with 20 US and 17 New Zealand hyperactive-aggressive children (mean age = 8.9 yrs) show that methylphenidate was superior to placebo for about ⅓ of the Ss, but that there was little difference in effectiveness between different dosage levels, especially once .3 mg/kg was attained. Mild side effects were common at higher dosages. Of a variety of physician, parent, teacher, and psychological test and behavioral measures, teacher and physician ratings were the most sensitive to drug effects. No measures, including neurological ones, discriminated between

responders and nonresponders. It is concluded that methylphenidate is a useful treatment for hyperactive-aggressive children but that current doses may be too high and side effects more common than stated. (26 ref)—*Journal abstract.*

1703. Wilson, John T. & Wilkinson, Grant R. (Vanderbilt U, Medical School) **Delivery of anticonvulsant drug therapy in epileptic patients assessed by plasma level analyses.** *Neurology*, 1974(Jul), Vol 24(7), 614-623.—Used plasma levels of anticonvulsants (diphenylhydantoin and phenobarbital) and medical record reviews to assess the drug delivery system (compliance), appropriate dosage, and utilization of plasma level data in 94 6-16 yr old institutionalized epileptic children and adults (age range 21-56 yrs). A 2-phase study design was used, with the introduction of plasma level data marking the onset of the 2nd phase. Unexpectedly, the availability of plasma level data on 2 occasions did not produce appropriate changes in compliance or dosage adjustments (based on chemical criteria) that were clearly needed. It is concluded that the overall drug delivery system is inadequate, that inappropriate anticonvulsant doses are used, and that plasma level information on anticonvulsants is underutilized for many institutionalized epileptics. (17 ref)—*Journal abstract.*

1704. Winkler, Gerald F. & Young, Robert R. (Harvard U, Medical School, Boston) **Efficacy of chronic propranolol therapy in action tremors of the familial, senile or essential varieties.** *New England Journal of Medicine*, 1974(May), Vol 290(18), 984-988.—Reports a double-blind, cross-over study of oral propranolol vs placebo in 24 patients with action tremors of the familial, senile, or essential varieties which showed propranolol to be very useful in the treatment of at least 75% of these patients. It was particularly helpful in relieving disability produced by tremor of the upper limbs. Even if tremor cannot be totally suppressed, propranolol may benefit the patient if the amplitude of tremor is decreased to the point where it no longer interferes with writing, eating, drinking, or the other activities of daily living. It was more effective than alcohol in some patients and is the first agent to produce satisfactory suppression of severe action tremor without undue sedation or the risk of addiction. Finally, in no case was it necessary to discontinue therapy because of adverse reactions. Propranolol was not effective against nonaction tremors. (27 ref)—*Journal abstract.*

### Behavior & Group Therapy

1705. Abse, D. W. (U Virginia) **Clinical notes on group-analytic psychotherapy.** Charlottesville, VA: University Press, 1974. ix, 192 p.—Defines group-analytic psychotherapy, outlines its history and present position in the field of mental health, suggests methods for determining the ideal group, and discusses the nature of the general pattern for conducting group sessions. It is stressed that group therapy is specifically valuable for treatment of psychoneurotic patients who have difficulty with interpersonal relationships. (13 p ref)

1706. Akin, Clifford & Kunzman, Glen G. (Calgary Div of Mental Health, Alberta, Canada) **A group desensitization approach to public speaking anxiety.** *Canadian Counsellor*, 1974(Apr), Vol 8(2), 106-111.

—Outlines a program designed to behaviorally reduce symptoms of public speaking anxiety in university students. Program evaluation with 84 student participants shows that a mixed behavioral format emphasizing practice situations produced results similar to traditionally operant or desensitization formats, with less attrition in attendance. Statistically significant changes on fear inventory scores was the measurable objective outcome of the program. Results suggest that individual desensitization as a supplement to the group program may be clinically helpful for the exceptionally distressed. S. D. Meichenbaum et al's 1971 finding that "anxiety specific" Ss respond more positively to a behavioral approach than do globally anxious Ss was supported, although not at a statistically significant level. (French summary) —*Journal abstract.*

1707. Bancroft, John . (U Oxford, England) **Deviant sexual behaviour: Modification and assessment.** Oxford, England: Clarendon, 1974. ix, 256 p.—Surveys ethical and sociological problems involved in the treatment of sexual deviance, and traces the historical development of behavioral techniques. Modern theoretical and empirical methods, evaluation, and measurement of change in behavioral techniques are discussed, and clinical findings and prognoses for such deviations as homosexuality, exhibitionism, and sado-masochism are delineated. (17 p ref)

1708. Barrett, Thomas J. & Sachs, Lewis B. (Bethesda Community Mental Health Ctr, Denver, CO) **Test of the classical conditioning explanation of covert sensitization.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1312-1314.—In 4 variations of the covert sensitization procedure, smokers were given different orders of the presentation of the aversive scene and the smoking scene. Although there was a significant reduction in smoking, none of the 4 variations differed in effectiveness. The classical conditioning explanation is discarded in favor of cognitive, motivational, or nonspecific factors.

1709. Bellack, Alan S.; Rozensky, Ronald & Schwartz, Jeffrey. (U Pittsburgh, Clinical Psychology Center) **A comparison of two forms of self-monitoring in a behavioral weight reduction program.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 523-530.—37 overweight Ss were recruited for a behavioral weight-reduction program incorporating self-monitoring of food intake. Prebehavioral monitoring (PM) was compared with postbehavioral monitoring (PTM), a nonmonitoring condition (NM) and a waiting list control condition (WL). The PM group lost the most weight, followed by the NM, PTM, and WL groups in that order. The PM and NM groups continued to lose weight after treatment ended. Every S in the PM group lost weight. The PTM group did not differ from the WL group at the end of treatment or at follow-up. The parameters of self-monitoring behavior are discussed and suggestions made for research and clinical usage of self-monitoring. (15 ref)—*Journal abstract.*

1710. Blay Neto, Bernardo . (São Paulo Pontifical Catholic U, Brazil) **[Scotomization of group fantasies.]** (Port) *Revista de Psicologia Normal e Patológica*, 1970(Jul), Vol 16(3-4), 320-326.—Describes a therapist's

use in group therapy of fantasies originated by him and their effects on group fantasies and preconceptions.

1711. Blechman, Elaine A. (Drug Dependence Unit, New Haven, CT) **The family contract game.** *Family Coordinator*, 1974(Jul), Vol 23(3), 269-281.—Describes a programmed board game, the Family Contract Game, which can be used to guide family members through the basic steps of interpersonal problem solving. Families can also, in 15 min, write a contract which identifies a problem behavior, a suitable replacement behavior, and appropriate reinforcement and recording of the appropriate replacement. The clinical use of the game with families who usually fail in therapy is discussed. (31 ref)

1712. Boš, Petr . (Child Psychiatric Hosp, Dubí bei Teplice, Czechoslovakia) **[The application of projective methods in studying family communication.]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1973(Dec), Vol 25(12), 736-740.—Reports on the feasibility of applying projective techniques in treating family groups. Zullinger's Diapositiv Z-Test was administered to an entire family. Taped recordings of the responses revealed information concerning communication and communication disturbances among the family members.—K. J. Hartman.

1713. Branham, Lee & Katahn, Martin . (Nebraska Psychiatric Inst, Omaha) **Effectiveness of automated desensitization with normal volunteers and phobic patients.** *Canadian Journal of Behavioural Science*, 1974(Jul), Vol 6(3), 234-245.—Compared the effects of live and automated desensitization on 21 clinical patients and 21 college students reporting various fears. Taking the sample as a whole, those subjected to live and to automated desensitization improved more than controls but were not significantly different from each other. Further analysis showed, however, that the 2 treated groups of college students improved more than student controls under both treatment conditions; neither of the treated groups of patients differed significantly from the patient control group. It is noted that the difference between live and automated treatment may be less than the difference between the time-limited, single-technique approach used in analog studies and the more varied, responsive treatment employed by clinical behavior therapists. (French summary) (27 ref)—*Journal abstract.*

1714. Brown, Robert S. (Hope Coll) **A note on body readiness in encounter groups.** *Interpersonal Development*, 1973-1974, Vol 4(1), 58-61.—Studied the observable effects of instructional relaxation (IR)—induced body readiness exercises—prior to an encounter experience, in an exploratory inquiry with college students. The apparent differences between the groups are reported, and suggestions for further investigation of IR effects on personality measures are noted.

1715. Burt, Vasanti; Whitlock, Doris & Franks, Violet . (California School of Professional Psychology, Los Angeles) **Modification of low self-esteem in women alcoholics: A behavior treatment approach.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 36-40.—Describes a pilot study of a behavior modification program to increase the coping skills of women alcoholic patients. A lack of attention to the low self-esteem of such patients may have accounted for their low probability of maintaining sobriety after termination of

inpatient treatment. 16 women were given a variety of behavioral treatments: relaxation, desensitization, assertive training, and several innovative procedures. 10 Ss demonstrated either total or improved abstinence after a 16-wk follow-up. Black women seemed to be more successful than white women and young Ss more successful than older Ss. Several evaluative measures—the Taylor Manifest Anxiety Scale, the Internal-External Locus of Control Scale, and the Tennessee Self Concept Scale—tended to show a pattern of gains after treatment, followed by decline after 16 wks in the community.—C. P. McCreary.

1716. Cautela, Joseph R.; Flannery, Raymond B. & Hanley, Stephen. (Boston Coll.) **Covert modeling: An experimental test.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 494-502.—Compared the effects of covert modeling, overt modeling, and attention placebo in the reduction of fear of rats in a laboratory situation with 30 female undergraduates. There was no difference between the overt and covert groups on 3 behavioral (approaching, stroking, and holding the rat) or 2 subjective measures (Fear Intensity Scale and a fear of laboratory rat survey). The overt group was superior on 1 subjective measure. This supports other experimental and anecdotal evidence that covert and overt modeling are equally effective. (22 ref)—*Journal abstract.*

1717. Cohen, Rudolf et al. (U Konstanz, Div of Psychology, W Germany) **[Behavioral therapy.]** (Germ) *Nervenarzt*, 1972(Mar), Vol. 43(3), 113-124.—Presents a study of the history, theory, techniques, objectives, and results of behavioral therapy. Classic operant conditioning, reinforcement, punishment, extinction, operant conditioning of schizophrenics, systematic desensitization, and aversion therapy are described. The merits of behavior modification therapy, present and future areas of research and application, and new trends and goals are discussed. (1 p ref)—T. Fisher.

1718. Cohen, Rudolf et al. (U Konstanz, Div of Psychology, W Germany) **[Three years of experience with a token economy in a psychiatric ward for extremely inactive schizophrenic patients.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol. 2(4), 243-277.—Describes a behavior modification program aimed at the rehabilitation of 20 passive and socially withdrawn chronic schizophrenics in a psychiatric ward. Ss were 9 female and 11 male 34-67 yr old patients hospitalized for an average of 20 yrs. A token pay system was used for operant conditioning of work and social behavior, and Es recorded the resulting changes and improvements and whether they were maintained after the gradual removal of the reward system. Significant improvements took place, particularly in work behavior, and were maintained even after the end of the applied reinforcement techniques. The same improvements were obtained under several experimental conditions. It is concluded that the positive changes were based less on the reward incentive than on a new and clearer understanding of the staff's expectations and reactions. (English summary) (45 ref)—T. Fisher.

1719. Denholtz, Myron S. & Mann, Edward T. (New Jersey Medical School, E Orange) **An audiovisual program for group desensitization.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol. 5(1),

27-29.—Used the responses of 102 20-69 yr old volunteers to 160 scenes, 80 fearful and 80 pleasant, to develop audiovisual hierarchies of 27 fearful and 27 pleasant scenes related to flying. A film was made presenting these scenes in pairs for automated treatment, each pair being preceded and followed by relaxation instructions. The possible use of this and similar films by nonprofessionals is noted.—*Journal abstract.*

1720. Edwards, K. Anthony. (Minot State Coll) **Physical restraint as time-out in therapy.** *Psychological Record*, 1974(Sum), Vol. 24(3), 393-397.—Studied the use of physical restraint as time-out for aggressive behavior. Nonsystematic use of physical restraint and drugs failed to eliminate violent outbursts and foul language for a 29-yr-old male in a state mental hospital. Subsequently, behavior free from violence and foul language was followed by progressively longer periods of freedom from restraint and increased access to reinforcing activities. 19 days were required to reduce the aggressive behaviors to zero. Checks made 17 and 380 days after the program was terminated indicated continued absence of aggressive behavior.—*Journal abstract.*

1721. Engel, Bernard T.; Nikoomanesh, Parviz & Schuster, Marvin M. (Baltimore City Hosp, Gerontology Research Ctr, MD) **Operant conditioning of rectosphincteric responses in the treatment of fecal incontinence.** *New England Journal of Medicine*, 1974(Mar), Vol. 290(12), 646-649.—Taught 6 patients (1 6-yr-old girl and 5 40-54 yr old adults) with severe fecal incontinence and manometric evidence of external-sphincter impairment to produce external-sphincter contraction in synchrony with internal-sphincter relaxation. These responses were induced by rectal distention. During follow-up periods ranging from 6 mo to 5 yrs, 4 of the patients remained completely continent, and the other 2 were definitely improved. One patient who was trained to relax her internal sphincter as well as to contract her external sphincter not only was continent but also regularly had normal bowel movements, which she had not had before. The training technique was relatively simple to apply, and learning occurred within 4 sessions or less. Findings highlight the importance of synchronized rectosphincteric responses in the maintenance of fecal continence, and they show that these responses can be brought under voluntary control in patients with chronic fecal incontinence, even when the incontinence is secondary to organic lesions. (17 ref)—*Journal abstract.*

1722. Epstein, Leonard H. & Hersen, Michel. (VA Ctr, Jackson, MS) **A multiple baseline analysis of covert control.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol. 5(1), 7-12.—Used covert control procedures, assessed in a multiple baseline design, to modify 3 high rate, target behavior problems (finger-picking, lip-biting, and cigarette-smoking) in a 28-yr-old male psychiatric patient. An additional target behavior (mood) remained untreated to serve as a control. Successful control and maintenance were obtained by covert techniques; however, instructional or self-monitoring effects could not be discounted. (18 ref)—*Journal abstract.*

1723. Epstein, Leonard H.; Hersen, Michel & Hemphill, Diana P. (VA Ctr, Jackson, MS) **Music feedback in the treatment of tension headache: An**

**experimental case study.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 59-63. —Conducted 2 experiments with a 39-yr-old male patient to evaluate the effects of biofeedback (music presented contingent on low electromyogram levels) on tension headaches during inpatient and outpatient phases. Dependent variables included frequency and intensity of headaches in both phases, and antiheadache medication as needed in the outpatient phase. Results indicate that the patient's headache levels and medication requirements were low during biofeedback but increased when biofeedback was terminated. Antitension exercises involving deep breathing and stretching of neck muscles introduced during a clinical follow-up were associated with a sustained decrease in headaches. —*Journal abstract.*

1724. Evans, Ian M. (U Hawaii) **A handy record-card for systematic desensitization hierarchy items.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 43-46. —Describes a card for recording progress in systematic desensitization. The card has space for writing the hierarchy item and for recording various elements of the client's response. Allowance is made for a number of procedural variations that have become common in clinical desensitization.

1725. Finlay, Donald G. (U British Columbia, Vancouver, Canada) **Alcoholism: illness or problem in interaction?** *Social Work*, 1974(Jul), Vol 19(4), 398-405. —Discusses the concept that excessive drinking may be a symptom of a person's faulty interaction with his family and significant others. Studies using this social systems approach (i.e., in which the family is regarded as the basic unit for treatment) are evaluated. Data suggest that (a) rehabilitation workers who viewed alcoholism as an illness did not have as great a success in working with alcoholic patients as did workers who held interaction orientations and (b) group counseling may be more effective than individual counseling in decreasing drinking. The need for further study of this explicit interactional approach toward alcoholism is emphasized, and the limitations of individualistic and illness-oriented models of alcoholism are noted. —*L. Gorsey.*

1726. Florin, Irmela; Cohen, Rudolf & Meyer-Osterkamp, Susanne. [A study of operant conditioning of social behavior in chronic schizophrenics.] (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Suppl 1, 76 p.

1727. Fodor, Iris E. (New York U) **Sex role conflict and symptom formation in women: Can behavior therapy help?** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 22-29. —Reviews case histories of women, noting that sex-role conflicts were often a core issue underlying the presenting symptoms. Fears of achieving, depressions, rigid acceptances of the feminine stereotype, and sexual and delinquency problems reflect conflicts over the feminine role. Behavioral techniques such as desensitization, assertive training, role modeling, and positive reinforcement for behavior change seem suitable for women struggling with sex-role conflict. —*C. P. McCreary.*

1728. Frankel, Fred H. (Harvard U, Medical School, Boston) **Trance capacity and the genesis of phobic behavior.** *Archives of General Psychiatry*, 1974(Aug), Vol 31(2), 261-263. —Discusses the reported increased effec-

tiveness in the therapy of phobic behavior when hypnosis is combined with the treatment, or when it is used as the vehicle for treatments such as suggestion, desensitization, or insight-oriented psychotherapy. 2 cases which demonstrate the similarity between a phobic panic state and the trance experience are presented. The knowledge that marked hypnotizability can contribute to the production of unusual clinical syndromes suggests the need to study how smaller degrees of hypnotic capacity could be responsible for the production of other symptoms, such as phobic behavior. In traditional psychodynamic terms, it is suggested that the trance or hypnotic experience is involved spontaneously as a defense mechanism against intolerable anxiety, and the accompanying social situations, or important aspects of them, are then perceived in a distorted fashion. In behaviorist terms, this is then learned and reinforced by repeated perceptually distorted experiences. —*Journal abstract.*

1729. Gerlinghoff, Monika & Schwarz, Dieter. (Max Planck Inst for Psychiatry, Munich, W Germany) **[Behavior modification in the treatment of hospitalized patients with obsession psychoses.]** (Germ) *Nervenarzt*, 1972(Mar), Vol 43(3), 124-129. —Presents and discusses 3 case histories: the desensitization treatment of a 37-yr-old male with contact phobia and wash ritual compulsion; the treatment of a 31-yr-old male with a disturbed day-night sleep rhythm caused by imaginary worries, dangers, and responsibilities, and compulsive activities at night to avert and control dangerous situations; and treatment of a 29-yr-old male with an obsessive preoccupation with numerous unimportant details, compulsive and pedantic daily rituals, and wash rituals. Results of the treatment are described, analyzed, and compared with similar cases in the literature. Special aspects discussed include treatment of the conditioned motor reactions and of the conditioned autonomic drive, the method of response prevention, modification of expectations, token economy reinforcement, and the techniques used to progress from outside direction of behavior by the therapist to internal control by the patient. (27 ref) —*T. Fisher.*

1730. Gershman, Louis & Clouser, Randall A. (Villanova U) **Treating insomnia with relaxation and desensitization in a group setting by an automated approach.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 31-35. —Exposed 20 undergraduate insomniacs with average sleep onset times of 65 min to group relaxation or group desensitization treatments via automated tape-recorded directions for a 4-wk period. Both experimental groups exhibited significant improvement ( $p < .005$ ) while 2 control groups (poor sleepers and normal sleepers) showed no changes. Desensitization treatment was also associated with changes on the 16 Personality Factor Questionnaire in the direction of greater emotional self-confidence. Ss who received muscle relaxation instructions showed significant changes in the direction of greater stability on the Eysenck Personality Inventory. Follow-up data 12 mo later showed significant retention of short-term gains for both groups. Clinically, it appears feasible to make use of both techniques by a group automated approach as safe alternatives to drugs and electrosleep methods.

which in the past have been frequently associated with undesirable side effects. (19 ref)—*Journal abstract*.

1731. Goldfried, Marvin R. & Trier, Christine S. (State U New York, Stony Brook) **Effectiveness of relaxation as an active coping skill.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 348-355.—Notes that the status of relaxation training as an effective treatment procedure is unclear. A possible reason for inconsistent findings may be the way in which the training procedure is presented, or at least the way in which the S or client may construe it. The present study with 27 speech-anxious college students used public-speaking anxiety as the target behavior and presented relaxation training in 2 ways. In Condition 1, Ss were told that the relaxation exercises would more or less automatically reduce their anxiety level. In Condition 2, relaxation was presented within a self-control context in which Ss were told that they were learning an active coping skill. A 3rd condition involved group discussion and was included as a means of controlling for attention-placebo factors. On a variety of different measures, within-group changes consistently favored the self-control relaxation condition. This was true of the speech anxiety measures as well as indicators of anxiety in other types of situations. The finding that Ss in the self-control relaxation condition continued to improve even after termination was interpreted as being consistent with a view of self-control that involves a learned skill which improves with repeated practice. (35 ref)—*Journal abstract*.

1732. Greenspan, Stanley I. (National Inst of Mental Health, Adelphi, MD) **The clinical use of operant learning approaches: Some complex issues.** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 852-857.—Considers that the clinical use of operant learning approaches demands a full understanding of a patient's behavioral organization and the many experiences that constitute reinforcement. This involves considering the appropriate functional response classes, the "core" functional response classes, the integration of precursor and end goal behaviors (as seen in the natural development of complex behavior patterns in children), program flexibility, and the variety of stimulus configurations a patient may experience as reinforcing. The value of changing behaviors vs changing the patient's experience of reinforcement is examined.—*Journal abstract*.

1733. Hallam, R. S. (Maudsley Hosp., London, England) **Extinction of ruminations: A case study.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 565-568.—Describes the case of a 15-yr-old girl whose main obsessional ritual consisted of persistent questioning. When she was placed on a 24-hr extinction schedule during which no reassurance was provided, questioning was eliminated in 3-4 wks, and there was marked improvement in intellectual functioning and socialization.

1734. Hand, I.; Lamontagne, Y. & Marks, I. M. (U Hamburg, Psychiatric Clinic, W Germany) **Group exposure (flooding) in vivo for agoraphobics.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 588-602.—Treated 25 patients with chronic agoraphobia in 6 groups of 4-5 patients each. The 1st 4 groups were led by 2 therapists, and the other 2 groups by 1 therapist. Each patient received 12 hrs of exposure (flooding) in vivo for 3 days, 4 hrs/day. 3 groups were structured to increase

social cohesion during exposure, while the other 3 were unstructured so that members were exposed to a minimum of group influence. Structured groups became significantly more cohesive than unstructured groups, although cohesion developed spontaneously in all groups. Therapists found it easier to lead cohesive groups. On behavioral tests, the outcome for all groups was at least as good as in previous trials with individual patients. Patients from structured groups felt less overall immediate improvement during the treatment week, but contrary to prediction, all groups improved similarly on phobic anxiety scales 3 days after treatment. Structured groups were significantly more improved than unstructured groups 3 and 6 mo later on phobic and global improvement scales. Concomitant personality problems of the patients are noted, and the feasibility of behavioral avoidance tests as measures of phobia are discussed. (22 ref)—*Journal summary*.

1735. Haynes, Stephen N.; Woodward, Sam; Moran, Robert & Alexander, Douglas. (U. South Carolina) **Relaxation treatment of insomnia.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 555-558.—14 insomniac undergraduates received either relaxation training or placebo therapy. Following a 2-wk baseline self-observation period, Ss underwent 6 1/2-hr sessions of either group relaxation or group placebo treatment. Both groups demonstrated significant improvement in their sleep patterns, but the relaxation group demonstrated significantly greater improvement than the placebo therapy group. It is concluded that relaxation can be an effective treatment method for insomnia, but expectation and demand characteristics are contributing factors.—*Journal abstract*.

1736. Jeffrey, D. Balfour. (Emory U) **A comparison of the effects of external control and self-control on the modification and maintenance of weight.** *Journal of Abnormal Psychology*, 1974(Aug), Vol 83(4), 404-410.—In an experimental study of weight reduction, 62 obese men and women were administered a pretreatment questionnaire and randomly assigned to 3 experimental treatment groups: (a) an external control group with a nonrefundable contingency, (b) a self-control group with a refundable contingency, and (c) a self-control group with a nonrefundable contingency. Results indicate that the self-control and external-control treatments were equally effective in producing reduction in weight. However, both self-control interventions were more effective than the external-control intervention in promoting maintenance of weight loss. (23 ref)—*Journal abstract*.

1737. Keegan, David L. (U Saskatchewan, Saskatoon, Canada) **Adaptation to visual handicap: Short-term group approach.** *Psychosomatics*, 1974, Vol 15(2), 76-78.—Presents short-term group therapy for visual disability as an approach to adjustment and rehabilitation during the life-crisis of blindness. The group process, leader's reaction, and certain suggestions to modify the group approach are discussed.

1738. Kehrer, Hans E. (U Münster Neuroclinic, Div of Child & Juvenile Psychiatry, W Germany) **[Treatment of anorexia nervosa by behavioral therapy.]** (Germ) *Nervenarzt*, 1972(Mar), Vol 43(3), 129-136.—Reports typical cases of anorexia nervosa in 3 girls 18, 15, and 12

years old and describes their treatment through operant conditioning, behavior modification, and environmental changes. Positive changes in eating behavior, physical health, and psychic attitudes were achieved in 2-4 mo. The concepts and methods of behavior modification therapy are discussed.—*T. Fisher.*

1739. Ladouceur, Robert. (Clinique Psychiatrique de Bel-Air, Geneva, Switzerland) **An experimental test of the learning paradigm of covert positive reinforcement in deconditioning anxiety.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 3-6.—Tested J. Cautela's (see PA, Vol 47:9068) learning paradigm for covert positive reinforcement (CPR) by comparing 2 treatment groups—a CPR group as described by Cautela and a reversed-CPR group—with a no-treatment control group. Ss were 30 rat-fearful college students. A behavioral avoidance test revealed no significant differences between the 2 treatment groups, but both showed greater improvement than the no-treatment control group. Findings contradict Cautela's hypothesis and favor a reciprocal inhibition explanation.—*Journal abstract.*

1740. Lain, Margaret E. & Schoenfeld, Lawrence S. (Trinity U) **Effects of three conditioning paradigms on visual attention to alcoholic stimuli.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 409-410.—Randomly assigned 36 male alcoholics to 1 of 3 aversive conditioning paradigms or to a control group to determine the paradigm most effective in modifying visual attention to alcoholic stimuli. An outcome criterion of corrected difference scores was a combination of visual attention in seconds to viewed alcohol and nonalcoholic slides. An analysis of covariance with age as the covariate on the criterion yielded a statistically nonsignificant *F*.—*Journal abstract.*

1741. Larson, Donna; Easter, Polly & Ward, Barbara. (Boulder County Mental Health Ctr, Longmont Branch Clinic, CO) **A group treatment program for masochistic patients.** *Hospital & Community Psychiatry*, 1974(Aug), Vol 25(8), 525-528.—Describes a group treatment program conducted by 3 women therapists for 11 extremely dependent masochistic female patients who had been previously treated and had not improved. The patients identified behaviors they wanted to change, and the therapists designed tasks to help them reach their goals. 5 stages in the treatment of masochistic patients identified by the therapists during the course of the program are outlined.

1742. Lazarus, Arnold A. (Rutgers State U., New Brunswick) **Multimodal behavioral treatment of depression.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 549-554.—Multimodal behavior therapy emphasizes the need to pay direct attention to the correction of deviant behaviors, unpleasant feelings, negative sensations, intrusive images, irrational beliefs, stressful relationships, and possible biochemical imbalance. In treating depressed persons, especially those in whom suicide is probable, it is imperative to enjoin the patient to recognize and use a variety of positive reinforcers. Durable results usually call for a new range of interpersonal skills, the elimination of self-depreciation, time-projected images in which the client sees himself engaging in future rewarding activities, a "sensate focus"

of enjoyable events, a repertoire of adaptive affective reactions, and a behavioral pattern characterized by daily sampling of personally reinforcing activities.—*Journal abstract.*

1743. Leon, Gloria R. (U Minnesota) **Case histories of deviant behavior: A social learning analysis.** Boston, MA: Holbrook, 1974. vi, 293 p.—Presents a collection of 16 case histories of childhood, adolescent, and adult disorders to illustrate reinforcement and modeling influences in past and present social environments. Topics include severe speech deficits, habit disturbances, and minimal brain damage in children and phobic behavior, anxiety neurosis, psychotic depression, and schizophrenia in adolescents and adults.

1744. Leonhard, Karl. (Humboldt U Berlin, E Germany) **[Is individual therapy a behavior therapy?]** (Germ) *Psychiatrie, Neurologie und medizinische Psychologie*, 1973(Dec), Vol 25(12), 726-735.—Speculates that individual therapy is most closely related to behavior therapy in the treatment of situational phobias. Individual therapy interrupts the interplay of emotions producing the neurotic effect and thereby reduces the pathological fear. Individual therapy is seen as having the possibility of more lasting effects.—*K. J. Hartman.*

1745. MacDonald, Marian L. & Bernstein, Douglas A. (U Illinois) **Treatment of a spider phobia by in vivo and imaginal desensitization.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 47-52.—Describes the use of in vivo and imaginal desensitization procedures in the treatment of a spider phobia in a 24-year-old female graduate student. A diversity of in vivo programs, following a thematic hierarchy paradigm, are discussed in detail to encourage more frequent attention to and utilization of easily arranged, controlled exposures. (25 ref)—*Journal abstract.*

1746. Marshall, W. L.; Boutilier, J. & Minnes, P. (Kingston Psychiatric Hosp., Ontario, Canada) **The modification of phobic behavior by covert reinforcement.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 469-480.—Compared the ability of covert reinforcement procedures and experimental desensitization to reduce subjective distress and increase approach behavior to a harmless snake. 48 female undergraduates were assigned to 1 of 6 groups: (a) experimental desensitization (ED), (b) covert positive reinforcement (CPR), (c) covert negative reinforcement (CNR), (d) noncontingent covert positive reinforcement (N-CPR), (e) placebo controls (PC), and (f) no-treatment controls (NT). Results indicate that CPR and ED were equally effective, and both showed greater improvement than either of the control groups. CNR Ss also did better than the controls, but after treatment the combined CPR and ED group showed a greater increase in approach behavior than the CNR Ss. Thus CPR appears to be an equal alternative to ED and may be more economical of time, whereas CNR may only be useful when the other 2 procedures are not appropriate. (30 ref)—*Journal abstract.*

1747. McLachlan, John F. (Donwood Inst, Toronto, Ontario, Canada) **Social competence and response to group therapy.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 248-250.—Studied the relationship between person perception and group therapy outcomes by developing a modified semantic differential version of

R. Harrison's Person Description Instrument (PDI). Ss were 87 alcoholic inpatients in 11 psychotherapy groups (mean age = 45.7 yrs). Following detoxification, all Ss participated in 26 hrs of group therapy for 3 wks. Based on Harrison's factor analysis results, 10 semantic differential items were constructed from the PDI interpersonal and noninterpersonal dimensions. Ss completed this "social competence" scale after 3 days (4½ hrs) of therapy and again after the end of 3 wks; in addition, the Barron Ego-Strength scale was administered. Initial social competence ratings of self and others predicted S's perception of his improvement during therapy, and both staff and peer ratings of S's initial level of social competence predicted staff ratings of therapy outcome.—L. Gorsev.

1748. McPherson, Lynne & Joachim, Ron. (Challinor Ctr, Ipswich, Queensland, Australia) **The use of electric shock to reduce head-banging in a mentally retarded boy: A case study.** *Australian Journal of Mental Retardation*, 1974(Mar), Vol 3(1), 20-24.—Describes procedures by which the incidence of head-banging was decreased significantly in a 9-yr-old retarded boy. The behavior did recur on isolated occasions and possible reasons for this action are suggested.

1749. Mills, Gary K. & Solyom, Leslie. **Biofeedback of EEG alpha in the treatment of obsessive ruminations: An exploration.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 37-41.—Gave 5 ruminating obsessives (mean age = 32 yrs) 7-20 biofeedback training sessions to learn control of EEG alpha waves. Results indicate that (a) some obsessives learned EEG control; (b) special augmented instructions seemed no better than standard, minimal instructions in aiding Ss to produce alpha; (c) subjective states during alpha were reported as relaxed, daydreaming, and not thinking; and (d) although difficult to generalize beyond the feedback situation, virtually no ruminations occurred during alpha regardless of the amount of alpha produced. Further study is indicated before a treatment program can be considered. (16 ref) —*Journal abstract.*

1750. Navarro A., Roberto. (U Iberoamericana, Mexico City, Mexico) **[New therapeutic techniques of counter-conditioning: Skin consciousness and visceral awareness.]** (Span) *Revista Interamericana de Psicologia*, 1974, Vol 8(1-2), 69-85.—Compared the effectiveness of skin consciousness, visceral awareness, and J. Wolpe's Muscular Relaxation techniques, using 3 independent groups of 12 women each (average age 28 yrs). Ss evaluated the techniques on a 9-point scale for each of the following variables: degree of muscular relaxation, degree of skin relaxation, degree of visceral relaxation, intensity of feelings of joy, intensity of feelings of well-being, degree of sexual excitement, tranquility, and degree of self-confidence. Results indicate some differences between the 3 techniques but not much difference in their global effectiveness in neutralizing anxiety. It is concluded that the new techniques of skin consciousness and visceral awareness are usable for experimental purposes in counterconditioning of anxiety symptoms. (English abstract)—S. Slak.

1751. Neff, Richard. (Unitarian Universalist Church, Farmington, MI) **The group constellation.** *Psychothera-*

*py: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 80-82.—Suggests a technique to facilitate a group member's articulation of feelings about his role in the group and his relationship to other group members. The member is asked to "sculpt" the human environment in the group. This procedure fits into a variety of "closed" therapeutic and encounter models.

1752. Ohno, Yoshiteru et al. (Kyushu U, Faculty of Medicine, Fukuoka City, Japan) **The treatment of hysterical blindness by behavior therapy.** *Psychosomatics*, 1974, Vol 15(2), 79-82.—Presents 3 case reports of hysterical blindness and discusses the use of behavioral therapy for this disorder. Some general rules are outlined. It is suggested that the original anxiety-provoking situation should be ameliorated, and manipulation of the environment and social conditions as a positive reinforcement should be used. Operant conditioning or behavior modification by suggestion and desensitization is also considered helpful.—*Journal abstract.*

1753. Paulson, Morris J., et al. (U. California, Los Angeles) **Parents of the battered child: A multidisciplinary group therapy approach to life-threatening behavior.** *Life-Threatening Behavior*, 1974(Spr), Vol. 4(1), 18-31.—Reports the demographic findings and the experience of a 3-yr, multidisciplinary group psychotherapy program with 31 child-abusing families. No predictive demographic characteristics were identified. The abuse of children ranged from mild bruising to severe brain damage and multiple fractures. Group therapy as an intervention procedure had its successes and failures. The dynamics of male-female cotherapists, the peer group sharing, and the capacity to ultimately verbalize inadequacies in the parenting role were crucial factors in therapy. As an experiential encounter the study gives an insight into the personal and family pathology of parents who abuse their children.—*Journal abstract.*

1754. Petzold, Hilarion. (St Denys Inst, Paris, France) **[The diagnostic and therapeutic possibilities of psychodrama in the "tetradic system."]** (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(3), 151-181.—Describes how the triadic concept of J. L. Moreno and the French School, combining psychodrama, group dynamics, and analytic group psychotherapy, has been enlarged by the concept of "behavior drama." This tetradic system, which attempts to combine concepts from psychoanalysis and learning theory, is structured in 4 phases: (a) The diagnostic-amnesic phase reveals the areas of conflict. (b) The "acting out" of conflict obtains catharsis for the protagonist. (c) The members of a group share experiences with the protagonist. (d) Conclusions are drawn from the preceding phases in order to modify undesired behavior patterns or build up new ones through behavior drama (i.e., role-playing that applies the principles of learning theory).—H. Bruml.

1755. Pollak, Michael H. (U Oklahoma, Health Sciences Ctr, Oklahoma City) **Biofeedback of blood pressure changes: A treatment for essential hypertension?** *Biological Psychology Bulletin*, 1973(Dec), Vol 3(2), 49-56.—Reviews studies which have attempted to show that with the aid of external feedback or "biofeedback" human Ss can learn to control their blood pressure (BP). Experimental results are discussed in terms of the possible use of biofeedback in the treatment of essential

hypertension. Normotensive Ss trying to decrease their BP are more successful than those trying to increase it; but the magnitude of the BP differences has not, in general, been clinically significant.—*Journal abstract.*

1756. **Pratarotti, Antonio R.** (Santa Casa, Medical School, São Paulo, Brazil) **Group play therapy with autistic children.** *Revista de Psicologia Normal e Patológica*, 1970(Jul), Vol 16(3-4), 305-312.—Recounts an attempt to reach 6 8-13 yr old hospitalized boys with diagnoses of childhood schizophrenia or infantile autism. All had prior hospitalization and none were communicating verbally. During 3 mo of group play therapy all Ss responded to some degree, with attempts at communication and some decreases in self-destructive behavior; but when the transfer of 1 therapist resulted in a 2-wk pause in the sessions, the apparent progress was lost.—*N. T. Pinckney.*

1757. **Purinton, Michael; Healy, Jim & Whitney, Bill.** (Province of Manitoba Dept of Education, Winnipeg, Canada) **Layers of self: A group fantasy technique.** *Psychotherapy: Theory, Research & Practice*, 1974(Spring), Vol 11(1), 83-86.—Suggests a fantasy exercise based on the self theories of Rouke and Perls to be used as a group therapy technique. The exercise is designed to help each person on a trip through his superficial outer layers and his negative inner layers until he finally gets in touch with his unique inner self.

1758. **Raths, Otto N.; Bellville, Titus P.; Bellville, Carol J. & Garetz, Floyd K.** (U Minnesota, Medical School) **The counterphobic mechanism as a force in mate selection and marital stability.** *Family Coordinator*, 1974(Jul), Vol 23(3), 295-301.—Defines counterphobia (i.e., the actual preference of a person for the very situation he is afraid of) and suggests that it is one of the major causes of marital conflict. This choice may be unconsciously motivated and its source may lie in parental behavior (e.g., authoritarian family structures, the child's overdependence on his parents, or double-blind family conflicts). Examples of counterphobic behaviors in mate selection are presented, and the ways in which these behaviors can distort marital equilibrium are examined. It is considered that therapy should be focused on promoting a more successful relationship (either a successful marriage or a divorce) and resolving the phobia through a variety of experiences which increase mastery and self-esteem. The possibility of spontaneous resolution in counterphobic marriages is examined, and therapeutic strategies are discussed.—*L. Gorsey.*

1759. **Rehm, Lynn P. & Rozensky, Ronald H.** (U Pittsburgh) **Multiple behavior therapy techniques with a homosexual client: A case study.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 53-57.—Describes the case of a 21-yr-old male whose homosexuality and heterosexual avoidance were modified by education, self-management, desensitization, covert sensitization, aversive conditioning, aversion relief, orgasmic reconditioning, and assertive training. It is suggested that the analysis of an individual's homosexual behaviors may lead to the application of multiple techniques. Dimensions of analysis and problems in sequencing are discussed.—*Journal abstract.*

1760. **Ribes-Iñesta, Emilio & Guzmán, Eleazar.** (U Veracruz, Xalapa, Mexico) **Effectiveness of several suppression procedures in eliminating a high-probability response in a severely brain-damaged child.** *Revista Interamericana de Psicología*, 1974, Vol 8(1-2), 29-39.—Used successively 3 types of punishment—time-out, electric shock, and slaps—to suppress the undesirable high-frequency behavior of placing nonedibles in the mouth by a 14-yr-old girl with extended and deep brain lesions. All 3 punishments were effective in suppressing the behavior, but the suppression did not generalize to conditions other than those for which the punishment was administered. With punishment by electric shock, the undesired behavior even increased beyond the initial baseline level when punishment was discontinued. Results suggest limitations in the use of punishment for behavior suppression. (Spanish summary)—*S. Slak.*

1761. **Rickard, Henry C. & Dinoff, Michael.** **Behavior modification in children: Case studies and illustrations from a summer camp.** University, AL: U Alabama Press, 1974. 174 p. \$6.75.—Discusses the application of behavior modification, in the milieu of a therapeutic camp, to such problems as (a) soiling, clean-up, and orderliness behaviors; (b) the development of self-control and working in a group; and (c) classroom management and remedial instruction.

1762. **Rimm, David C. & Masters, John C.** (Southern Illinois U) **Behavior therapy: Techniques and empirical findings.** New York, NY: Academic Press, 1974. xvi, 513 p. \$11.95(cloth), \$5.75(paper).—Discusses the nature and origins of behavior therapy, and includes theoretical and empirical data on systematic desensitization, assertive training, modeling procedures, contingency management, operant methods in self-control, extinction procedures, and cognitive methods. (40 p ref)

1763. **Romanczyk, Raymond G.** (State U. New York, Binghamton) **Self-monitoring in the treatment of obesity: Parameters of reactivity.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 531-540.—Assigned 70 overweight Ss to 5 groups to assess the reactive nature of self-monitoring procedures. The groups were (a) no-treatment control; (b) self-recording daily weight; (c) self-recording daily weight and daily caloric intake; (d) behavior management and stimulus control instruction; and (e) behavior management, stimulus control, and self-recording of daily weight and daily caloric intake, with the initial treatment phase lasting 4 wks. Results show no significant difference between self-recording of daily weight and no-treatment control. Self-recording of daily weight and daily caloric intake, without therapist contact, was as effective as the behavior management and the behavior management and self-recording groups, both of which had weekly therapist contacts. Follow-up evaluations at 4 and 13 wks, respectively, indicated that the behavior management and behavior management and self-recording groups were not significantly different, although both showed a substantial weight loss that was maintained over the follow-up period. (26 ref)—*Journal abstract.*

1764. **Schutz, William C.** **Elements of encounter.** Big Sur, CA: Joy Press, 1973. 118 p.—Traces the history of the encounter movement, including group psychotherapy, T groups, psychodrama, and gestalt methods;

discusses the principles and psychological and physiological bases of encounter; details the theory of group development and of leader technique; and presents applications of encounter to psychotherapy, industry, education, religion, society, and daily life. (7 p ref)

1765. Sharpe, Robert. (Ctr for Behavioural Psychotherapy, London, England) **Behaviour therapy in a case of blepharospasm.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 603-604.—Describes the successful treatment of nonorganic blepharospasm in a 51-yr-old man. Relaxation and reinforcement strategies were used to reduce the spasms and enable the patient to keep his eyes open, and exercises were designed to increase the patient's repertoire of eyelid movements. At the end of 14 wks, about 3-4 periods of spasms occurred daily which were effectively controlled by the patient.

1766. Sirota, Alan D. & Mahoney, Michael J. (Pennsylvania State U) **Relaxing on cue: The self regulation of asthma.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Jul), Vol 5(1), 65-66.—Gave a 41-yr-old woman with severe asthmatic difficulties brief training in muscular relaxation as a means of avoiding and reducing bronchospasm. A portable timer was used to cue naturalistic self-monitoring of muscle tension and self-relaxation. Client records of medication frequency indicated a dramatic improvement in respiratory functioning and excellent maintenance at a follow-up assessment. The encouraging results of this self-management strategy, when contrasted with years of unsuccessful medical treatment, suggest the need for more controlled research on applications of behavior therapy to respiratory disorders.—*Journal abstract*.

1767. Stegat, Harry. (U Münster, Neuroclinic, W Germany) **[Study of conditioning therapy in enuresis.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1972, Vol 4(1), 306-322.—Investigated enuresis and its treatment by therapeutic conditioning in 60 male and 27 female 5-15½ yr old enuretics. Ss had a bedwetting frequency average of 9 times/wk. Es made thorough anamneses and administered a series of psychodiagnostic tests, EEGs, X-rays, and urologic examinations. A modified Mowrer waking apparatus was used for treatment. The treatment was successful with 52 males and 23 females, unsuccessful with 8 males and 4 females. 20 mo after completion of the treatment, the rate of relapse was investigated in 73 of the 75 cured Ss. 37 (25 males and 12 females) had relapsed and 36 (25 males and 11 females) had not. (English summary)—T. Fisher.

1768. Steinhauer, Jean C. (Texas Tech U, Counseling Ctr) **Tacit knowing as methodology for evaluating an encounter group.** *Interpersonal Development*, 1973-1974, Vol 4(1), 1-20.—Applies principles derived from M. Polanyi's (1968, 1969) "tacit knowing" in developing a methodology for evaluating an encounter group. The researcher as knower is the primary instrument for the study, which took place in a pre-, post-, and final testing and interviewing sequence with a 30-yr-old female S. The method is a rich source of data for understanding the diversity of outcomes for participants and of the way in which the experience of the group has settled into their lives. Based on single case studies, it is concluded that

the encounter group is an authentic experience of human sharing. (25 ref)—*Journal abstract*.

1769. Suinn, Richard M. (Colorado State U) **Desensitization therapy to establish self-confidence and social competency.** *Psychiatric Quarterly*, 1973, Vol. 47(4), 586-591.—Reports the case of a 36-yr-old male mathematician whose therapy involved desensitization both to reduce his anxiety in interpersonal relationships and to promote feelings of confidence and social competency. Treatment was characterized by (a) relaxation training, (b) reliance on accelerated desensitization, and (c) use of visualization to stimulate the desired feelings. Therapy was terminated after 9 sessions, with marked improvement in the client's condition. Results support the value of accelerated desensitization as short-term outpatient therapy. It is noted that the client's strong motivation and interest in behavior therapy was a meaningful factor in his progress.—B. McLean.

1770. Trautner, Hanns M. (U Mainz, Psychological Inst, W Germany) **[How good is behavior therapy? Observations on the evaluation of therapies.]** (Germ) *Zeitschrift für Klinische Psychologie*, 1973, Vol 2(4), 300-323.—Discusses the development of a system for criticizing and evaluating therapeutic methods and techniques of various types, using behavior therapy as a model. The 5 main aspects to be evaluated regarding any therapy are its goals, its method of selecting and defining those goals, its treatment methods, its efficacy, and its theoretical foundations. Subdivisions and interrelationships among these aspects are discussed. Behavior therapy must prove its superiority in terms of its efficacy and theoretical foundations rather than in terms of its treatment methods, treatment goals, and goal definitions. Psychotherapy research should put less emphasis on comparing rates of success, and more on a close examination of the processes which occur during the various types of psychotherapy. (English summary) (48 ref)—T. Fisher.

1771. Vachon, Michel; Pitre, Edgard; Malcuit, Gérard & Routhier, Serge. (St-Michel-Archange Hosp, Quebec, Quebec, Canada) **[Application of the experimental analysis of behavior to a remotivation situation.]** (Fren) *Canadian Journal of Behavioural Science*, 1974(Jul), Vol 6(3), 246-257.—In an experiment with 2 groups of 4 schizophrenics, the efficiency of a group discussion run according to the principles of the experimental analysis of behavior was compared with the traditional approach to remotivation. 2 target behaviors were chosen for study: speaking (intervention) and S-to-S interaction (social interaction). The number and length of interventions as well as the number of social interactions were used as the basic measurements. The experiment was divided into 2 parts with 2 Es. Group 1 held the usual group discussion in Part 1 and Part 2 after the leader was instructed. Group 2 used the behavioral approach in both parts of the experiment. Results show that the behavioral approach increased both the length of interventions and the number of social interactions, even though the leaders themselves actually spoke less. The principles of experimental analysis are discussed in relation to their application in a remotivation situation.—English summary.

1772. **Wehman, Paul H.** (Lincoln State School for Mentally Retarded, IL) **Effects of token reinforcement on maintaining oral hygiene skills in geriatric retarded women.** *Training School Bulletin*, 1974(May), Vol 71(1), 39-40.—A token reinforcement "star" program aimed at increasing the regularity of oral hygiene skills being performed was implemented in a cottage of 15 44-68 yr old moderate to severely retarded women. Results were generally successful with most residents taking more care in personal hygiene habits.

1773. **Wright, Shelle & McDonald, Claudia.** (Baylor U) **Review of behavioral treatment of depression.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1335-1341.—Behavioral treatments of depression are reviewed and categorized according to J. Wolpe's (see PA, Vol 48:3361) description of 3 types of circumstances in which pathologic reactive depression is observed. Theoretical conceptions of depression as a result of extinction and experimental support for this view are presented. Research implications include more adequate control groups, objective pre- and postassessment, further explanation of therapeutic procedures, and adequate follow-up evaluations. (23 ref)—*Journal abstract*.

1774. **Wynne, Louis.** (Bernalillo County Mental Health Ctr, Albuquerque, NM) **Synthesis of appropriate patient behavior in an aversive dental environment.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 519-524.—Describes in vivo desensitization of a patient with dental phobia, following earlier failures to treat the case with drug therapy. 12 30-min sessions over a period of 6 wks culminated in the patient's undergoing local anesthesia by hypodermic injection (the most feared aspect of the dental situation) and having a tooth cavity filled.—*Journal abstract*.

1775. **Zaffuto, Anthony A. & Zaffuto, Mary Q.** (Alphagenic Ctr, Santa Barbara, CA) **Alphagenics: How to use your brain waves to improve your life.** New York, NY: Doubleday, 1974. xviii, 245 p. \$6.95.—Demonstrates methods of training for self-induction of the alpha state in order to regulate behavior consciously through autosuggestion. Techniques for overcoming tension, anxiety, insomnia, overeating, alcoholism, and sexual difficulties are included. (12 p ref)

### Psychoanalysis

1776. **Barnes, Robert H.** (St Luke's Hosp Medical Ctr, Mental Health Div, Phoenix, AZ) **"The tyranny of words": Revisited.** *Dynamische Psychiatrie*, 1974, Vol 7(2), 91-99.—Attempts to increase the usefulness of verbal symbols by developing more precise meanings for them. It is suggested that biofeedback psychophysiology may be a further major break from dependence on verbal symbols. The biofeedback technique may be applicable to overcoming resistance in testing and therapy, and may help to attain more effective access to unconscious or heavily guarded feelings and thoughts. (German summary)—*Journal summary*.

1777. **Biran, S.** [The crisis of psychoanalysis and the position of psychoanalysis in modern psychiatry.] (Germ) *Nervenarzt*, 1972(Jan), Vol. 43(1), 9-17.—Considers that examining the "what" and the "how" of normal and pathological mental processes leads to the

same result: acceptance and confirmation of psychoanalysis as the only possible approach to an understanding of psychology and psychiatry. However, many of the specific statements and theories of psychoanalysis must be rejected or revised.—*T. Fisher*.

1778. **Edelweiss, Malomar L.** [Lay psychoanalysis: A recurrent topic.] (Port) *Estudos de Psicanálise*, 1973, No 6, 33-56.—Argues the case for lay psychoanalysis, citing Freud's opinions extensively. The need for lay analysts and the advantages of using them are discussed, and the efforts of the medical profession to exclude them are condemned. The arguments of a prominent Brazilian psychiatrist on the National Health Council, who favors lay psychoanalysis, are included. (English summary)(18 ref)—*N. T. Pinckney*.

1779. **Fordham, Michael.** **Jung's conception of transference.** *Journal of Analytical Psychology*, 1974(Jan), Vol 19(1), 1-21.—Critically examines Jung's writings on transference. Although Jung attributed to Freud the discovery of the therapeutic importance of transference, the theory here is that the therapeutic effect of psychoanalysis should be attributed to its development of awareness of the unconscious rather than to transference. Transference is interpreted as the ability to reveal all stages of the individuation process, projecting them into the analyst, who through his own experience of individuation becomes involved in an emotional dialectic with the patient. (21 ref)—*P. Federman*.

1780. **King, P. H.** **Notes on the psychoanalysis of older patients: Reappraisal of the potentialities for change during the second half of life.** *Journal of Analytical Psychology*, 1974(Jan), Vol 19(1), 22-37.—Sees the aging patient as threatened with disintegration and his inability to adjust to the changes demanded by the aging process. The following causes are discussed: diminution of sexual potency and capacity to have children, threat of displacement in work roles by younger persons, fear of retirement, illness or death of parents, onset of illness and dependence on others, and the possibility of the individual's own death. (51 ref)—*P. Federman*.

1781. **Reider, Norman.** **Metaphor as interpretation.** *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 463-469.—Presents the detailed history of the 4-yr psychoanalysis of a married woman in her 30's. The analogy which came up early in the analysis was the metaphor of the body for the house: the patient's rage and discontent over the redecoration of a house was, in reality, distress directed toward her own body. The progress of her treatment is described. A summary of the use of metaphors in psychoanalysis is provided.—*R. S. Albin*.

1782. **Rosenfeld, H.** **A critical appreciation of James Strachey's paper on the nature of the therapeutic action of psychoanalysis.** *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 455-461.—Discusses in detail a journal article of James Strachey (1934) which attempts a scientific approach to the central idea of the therapeutic function of psychoanalysis: the problem of interpretation. The meaning of these interpretations to both patient and analyst is outlined. The increase in knowledge since 1934 is presented. A lengthy discussion of the process of "working through" is included. Transference,

countertransference, and nonverbal communication are discussed. (20 ref)—R. S. Albin.

1783. Sarnoff, Charles A. **The vicissitudes of projection during an analysis encompassing late latency to early adolescence.** *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 515-522.—Reviews the case of a 9-yr-old girl in psychoanalysis for 5 yrs. Projection is defined and subdivided into projection associated with repression and projection associated with denial. The change from the repressive to the denial type is illustrated. It is seen that through projection the ego ideal is opened to influences from the peer group and the environment, providing a stepping-stone in the progress from childhood to adulthood through adolescence.—R. S. Albin.

1784. Weiss, Stanley S. (Franklin Medical Ctr Denver, CO) **Some thoughts and clinical vignettes on translocation of an analytic practice.** *International Journal of Psycho-Analysis*, 1972, Vol 53(4), 505-513.—Summarizes the literature on early termination of psychoanalytic cases. The initial response of several patients to the news of the relocation of their analyst is discussed. In the safety of the analytic situation the patient can experience the painful effects in full force without being overwhelmed. Through appropriate and well-timed interpretations, especially transference interpretations, control and ego-strength can be gained. Therefore, a move of the analyst that interrupts an analysis prematurely can become one of those "special events" that at times intrude into the analysis but can be used effectively to assist analytic progress.—R. S. Albin.

1785. Williams, Mary. **Before and after the flood.** *Journal of Analytical Psychology*, 1974(Jan), Vol 19(1), 54-70.—Examined the flood dreams of 3 patients as these represent the interplay between unconscious fantasy on the infantile level and mythological themes. The 3 patients had a hatred for their mothers, accompanied by an urge toward a self-destruction Judeo-Christian myths played an important part in their lives. The Biblical flood myth lends itself to fantasy, and symbolizes death and rebirth.—P. Federman.

#### Counseling & Community Mental Health & Crisis Intervention

1786. ———. **Gay couple counseling: Proceedings of a conference.** *Homosexual Counseling Journal*, 1974(Jul), Vol 1(3), 88-139.—Presents the introductory address on perspectives for counseling homosexuals involved in paramarital relationships, edited transcripts of panel discussions between therapists and homosexuals on the problems of male and female couples, and summaries of small group discussions which were part of the counseling conference sponsored by the Homosexual Community Counseling Center in May 1974.

1787. Atthowe, John M. (Rutgers State U, Medical School) **Behavioral innovation: An all-encompassing system of intervention.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Argues that treatment alone does not go far enough in solving problems that patients bring to the treatment setting, and

that a reconceptualization of mental health and illness in an all-encompassing structural framework is needed. Problems associated with assumptions about the goal of treatment, and the need for comprehensive mental health services and a new technology of behavioral intervention are examined. (49 ref)

1788. Baker, Frank & Broskowski, Anthony. (Harvard U, Medical School, Boston) **The search for integrality: New organizational forms for human services.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Because community mental health centers have taken on responsibilities for specific catchment areas and have developed functions necessary to implement relevant programs, staff members are often involved in a bureaucratic maze of human service systems, agency structures, and organizational relationships. Suggestions for alternative strategies in human services that can more realistically deal with multiproblem families without elaborate referral procedures and that can improve resource and program allocation and effectiveness are presented. (40 ref)

1789. Baker, Frank. (Harvard U, Medical School, Boston) **Are community mental health centers organizing for continuity and efficiency?** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Reviews definitions of the concepts of continuity of care and efficiency, related measurement problems, and recent evidence of the extent to which community mental health centers are accomplishing these goals. Patterns of center organization and administrative subsystems which greatly affect operations and goals are examined. (20 ref)

1790. Broskowski, Anthony & Smith, Terence P. (United Community Planning Corp, Boston, MA) **Manpower development for human service systems.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Discusses the necessity of having human service systems respond to changes in the social, political, and economic environments. Recent changes, including alterations in population, new social policies, and recent conceptual approaches to planning and administration, are examined for their effects on service systems, and statewide systemic approaches to service delivery and training are reviewed. (43 ref)

1791. Browning, Philip L. (Ed.). (U Oregon) **Mental retardation: Rehabilitation and counseling.** Springfield, IL: Charles C Thomas, 1974. xvi, 447 p.—Considers the definition, classification, etiology, and prevalence of mental retardation, and comprehensively discusses the areas of rehabilitation and counseling as they affect the practitioner and researcher in the mental retardation field.

1792. Christiansen, Charles H. & Davidson, Donald A. (US Air Force Hosp, Lakenheath, England) **A community health program with low achieving adolescents.** *American Journal of Occupational Therapy*, 1974(Jul), Vol 28(6), 347-350.—Describes an experience with a group

of about 12 children of US Air Force personnel at an Air Force hospital overseas. Low-achieving adolescents from the local school system for Air Force dependents were seen in the occupational therapy clinic on a regular basis. Using behavior modification techniques to manage the group, activities were then structured to meet the various needs of the students. Results of the program after its 1st year indicate that community intervention programs can be successfully implemented in hospital clinic settings. —*Journal abstract.*

1793. **Chu, Franklin D. & Trotter, Sharland.** (Yale U, Law School) **The madness establishment: Ralph Nader's Study Group Report on the National Institute of Mental Health.** New York, NY: Grossman, 1974. xxiv, 232 p. \$7.95.—Analyzes the reasons for the failure of the 1963 Community Mental Health Center Act, focusing on the ineffectiveness of the National Institute of Mental Health bureaucracy, the self-interest of the psychiatric profession, and the 2-tiered program of treatment, one for the rich and another for the poor. Recommendations and conclusions on the nature of bureaucratic and political manipulation in the field of public mental health are presented. (14 p ref)

1794. **Clarke, James & Horrigan, Jack A.** (Denver General Hosp, Mental Health Clinic, CO) **Outcome measurement and system modeling for managerial control and accountability.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs.* Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Describes an experimental approach to treatment-program outcome measurement—a quantitative method for assessing program quality which involves measuring the actual results of treatment for different types of clients. The method involves a multidimensional questionnaire based on the belief that there are linear functions that express outcome as a function of processing and input variables. Statistical and computer procedures for the system are outlined.

1795. **Cowan, Margie L. & Caldwell, H. Stephen.** (Oklahoma State U) **Agency sample and community population expectancies: Age, sex, problem, client-therapist characteristics.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 289-293.—Results of a survey of therapists in mental health agencies indicate significant age, sex, and presenting-problem patterns in persons who contacted these agencies. There were consistent client differences between campus and community mental health agencies. More females made contacts with mental health agencies. There was no relationship between age, sex and client-therapist pairing.

1796. **du Mas, Frank M.** **Medical, nonmedical, or antimedical models for mental health centers?** *American Journal of Psychiatry*, 1974(Aug), Vol 131(8), 875-878.—Describes 3 models for mental health centers—medical, nonmedical, and antimedical—in terms of personnel, administration, professionalism, and scientific method. It is suggested that a multistage transition through these models may occur, ending in a heterogeneous compromise model. A returning emphasis on the medical model as the nonmedical mental health professions reach maturity is predicted.

1797. **Ford, Donald H.** (Pennsylvania State U, Coll of Human Development) **Mental health and human development: An analysis of a dilemma.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs.* Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Suggests that complex terminology, definitions, and labels used in the delivery of mental health services has restricted professional insight and placed limitations on potential services. Consequences of the continued separation of the concepts of mental health and mental illness may be serious, and conceptually integrative approaches to human development and service design need to be formulated. (15 ref)

1798. **Gittelman, Martin; Dubuis, Jacques & Gillet, Michel.** (New York School of Psychiatry, Ward's Island) **Recent developments in French public mental health.** *Psychiatric Quarterly*, 1973, Vol 47(4), 509-520.—Discusses the advantages accruing to comprehensive public mental health services from sectorization—the provision, in a relatively small geographic area, for all the facilities and services required for patient care. These services and facilities include geriatric centers; child guidance clinics; foster home placement; day, night, and weekend hospitalization; vocational and rehabilitation centers; halfway houses; an inpatient hospital; and crisis intervention services. The successful implementation of this plan of "sector psychiatry" in the 13th arrondissement of Paris is described. It is noted that, despite budget cuts for personnel, programs, and new construction, the administrative structure of sectorization offers a viable solution to the problem of delivering adequate mental health services.—*B. McLean.*

1799. **Harshbarger, Dwight & Maley, Roger F.** (West Virginia U) **Behavior analysis and systems analysis: An integrative approach to mental health programs.** Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.

1800. **Hirschowitz, Ralph G.** (Harvard U, Medical School, Lab of Community Psychiatry, Boston) **Mental health consultation: The state of the art.** *Psychiatric Quarterly*, 1973, Vol 47(4), 495-508.—Notes that through consultation, mental health professionals have become links between human service agencies and have changed traditional modes of thought and practice. 6 specific roles of the psychiatrist in community mental health practice are outlined, and G. Caplan's (1970) 4 categories of mental health consultation—client-centered case consultation, consultee-centered case consultation, program-centered administrative consultation, and consultee-centered administrative consultation—are discussed in detail. Significant aspects of the consultation process are delineated, and qualities of intelligent questioning, listening, and communication in the language of the consultee are stressed.—*B. McLean.*

1801. **Holding, T. A.** (MRC Unit for Epidemiological Studies in Psychiatry, Royal Edinburgh Hosp, Scotland) **The B.B.C. "Befrienders" series and its effects.** *British Journal of Psychiatry*, 1974(May), Vol 124, 470-472.—Reports that following broadcast of an 11-episode TV series portraying the Samaritans as a suicide prevention service, an increase in Samaritan clients was noted in Edinburgh. No reduction in attempts to commit suicide was noted at the hospitals. It is concluded that perhaps

the Samaritans function more as a crisis intervention service than as a parasuicide prevention agency.—R. L. Sulzer.

1802. Iscoe, Ira . (U Texas, Austin) **Community psychology and the competent community.** *American Psychologist*, 1974(Aug), Vol 29(8), 607-613.—Traces the rapid emergence of community psychology and stresses the need for the generation of new knowledge on communities. The competent community is defined as one that is involved in the development and utilization of resources by community members and one in which there is increased sophistication in coping with problems and issues. The suggested role for community psychology in such a setting is (a) to foster growth and be prepared for the consequences of increased growth of hope and power (e.g., the rejection of the helpers); and (b) to facilitate dialog between those in power and those seeking it thus eliminating failures in community growth programs that may be brought on by a lack of built-in feedback mechanisms and a philosophy of those in power that fosters anticompetence and dependency. —Author abstract.

1803. Kantor, Owen; Hiller, Anne & Thuell, Jenifer . (Columbia U, School of Social Work) **Developing an activity program in a welfare hotel.** *Hospital & Community Psychiatry*, 1974(Aug), Vol 25(8), 520-524.—Describes a part-time activity program conducted by 2 occupational therapists for the middle-aged and elderly male residents of a welfare hotel in New York City. Obstacles encountered in setting up the program and its accomplishments are discussed, emphasizing the need to build the self-images of the residents, most of whom were discharged state hospital patients, alcoholics, addicts, and ex-offenders.

1804. Klerman, Gerald . (Harvard U, Medical School, Boston) **Current evaluation research on mental health services.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 783-787.—Cites the evident need for better administrative and fiscal supervision of community-based mental health service units as well as for professional assessment of such centers. Unless extra-governmental financial support is increased, making possible the gathering of evaluative data, social and professional growth may be stifled. (20 ref)

1805. Krapfl, Jon E. (West Virginia U) **Accountability through cost-benefit analysis.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Analyzes the principle of accountability and some of the problems in developing cost-benefit measures of human service programs. Different levels and types of cost analyses are described, in addition to how they relate to the basic problem of creating a public reporting system which will contribute to the development of a more efficient human service system.

1806. Levy, Leo . (U Illinois, Medical Ctr) **The use of evaluative research in creating accountability.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Discusses issues in the evaluation of social programs, including whether the planners of the program

should also function as evaluators, the advisability of evaluating effectiveness with the same criteria used in the theoretical model or delivery system, the composition of policy-making groups and their functions, and the optimal use of program evaluation results. Problems in regulating the power of institutions whose purpose is to act on behalf of the public are examined.

1807. Maley, Roger F. & Harshbarger, Dwight . (West Virginia U) **The integration of behavior analysis and systems analysis: A look at the future?** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Discusses the need for behavior analysts and systems analysts to recognize that they are dealing with different aspects of the same problem—the delivery and evaluation of human services systems. The problems of defining goals, organizing functions, and evaluating results represent the largest obstacles; however, the integration of behavior and systems analyses appears most promising for overcoming these issues.

1808. Marmorale, Ann M. & Brown, Fred . (Staten Island Community Coll, City U New York) **Mental health intervention in the primary grades.** *Community Mental Health Journal Monograph Series*, 1974, No 7, 63 p.—Reports on a 4-yr program conducted in a New York City school. Experimental Ss were 145 1st-graders (at the start of the program): 42% Puerto Rican, 31% Caucasian, 22% Negro, and 3% Latin American. The control group of 133 Ss was similar. All Ss underwent an extensive battery of tests. The experimental group and their families had access to psychiatric, medical, psychological, sociological, anthropological, social work, and remediation experts. Counseling, group work, remedial reading, medical treatment, case work, and consultation formed the core of the program. At the end of the 3rd grade there were no meaningful differences between the scores attained by the two groups on the Wechsler Intelligence Scale for Children, Bender-Gestalt, the Wide Range Achievement Test, Children's Apperception Test, Peabody Picture Vocabulary Test, and the Goodenough-Harris Drawing Test. (22 ref)—H. Silverman.

1809. Overs, Robert P.; O'Connor, Elizabeth & Demarco, Barbara . **Avocational activities for the handicapped: A handbook for avocational counseling.** Springfield, IL: Charles C Thomas, 1974. xxvii, 178 p.—Presents descriptions of activities for use in avocational counseling by recreation and occupational therapists, social workers, and counselors. The phenomenological and psychological dimensions, interpersonal relationships, and social settings of each activity are described.

1810. Pyke, S. W. . **Counseling and the feminist.** *Ontario Psychologist*, 1974(Apr), Vol 6(1), 45-48.—Describes several types of stress and strain unique to modern feminists. To be most effective, counselors must be cognizant of these pressures and even sympathetic with them. Counseling programs specifically designed for the struggling feminist may be useful.

1811. Richard, Wayne C. (Dede Wallace Ctr, Nashville, TN) **Crisis intervention services following natural disaster: The Pennsylvania recovery project.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 211-219.—Describes a human service flood recovery

program established by mental health authorities in Pennsylvania after the severe floods of 1972. The 1-yr project was based on a crisis intervention model using 63 trained paraprofessional human service counselors working in neighborhoods and homes across the state. During the 1st 8 mo of the project, over 1,500 cases were handled involving individuals, families, and groups with a wide range of problems. These problems included consumer complaints, alcohol abuse, emotional disturbances, family crises, financial and medical problems, unemployment, and substandard temporary living conditions. The project was an example of a disaster relief program which emphasized the psychological and psychosocial effects of tragedy.—*Journal summary.*

1812. Rodman, Doris H. & Collins, Malcolm J. (Walter E. Fernald State School for the Mentally Retarded, Social Service, Waverley, MA) **A community residence program: An alternative to institutional living for the mentally retarded.** *Training School Bulletin*, 1974(May), Vol 71(1), 52-61.—Describes the experiences of 62 mildly and moderately mentally retarded men and women, demonstrating the validity of the concept that, given a fairly normal environment, the mentally retarded can function in the community. Results suggest that emphasis should now be given to experimentation with similar programs for the severely and profoundly retarded as well as the multiply handicapped.

1813. Sarason, Seymour B. (Yale U) **The psychological sense of community: Prospects for a community psychology.** San Francisco, CA: Jossey-Bass, 1974. xii, 290 p. \$12.50.—Contends that community psychology has failed in its efforts at social reform. The adverse consequences of segregating the mentally ill, aged, and others in residential institutions are discussed. A new community psychology is proposed which emphasizes a sense of belonging and responsibility among community members.

1814. Shochet, Bernard R. (Sinai Hosp, Psychiatric Liaison Service, Baltimore, MD) **The role of the mental health counselor in the psychiatric liaison service of the general hospital.** *International Journal of Psychiatry in Medicine*, 1974(Win), Vol 5(1), 1-16.—Describes the role and function of the mental health counselor. Specific functions—e.g., screening new admissions and case findings—are documented by case examples. Numerical analyses further illustrate the utilization of the counselor in a general hospital.

1815. Spaner, Fred E. (NIMH, Community Mental Health Consultation Section, Bethesda, MD) **New directions in community mental health center programs.** In D. Harshbarger & R. F. Maley (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Describes the general concepts, objectives, rationale, and current trends of the 1963 Community Mental Health Centers Act, in the areas of inpatient and outpatient services, partial hospitalization, programs for the continuity of care, and means of insuring accessibility and equity of services, community involvement, and accountability. Recommendations for further evolution of these processes are presented.

1816. Teegen, Frauke; Kranz, Dorothee & Fittkau, Bernd. (U Hamburg, Psychological Inst, W Germany)

[Investigation of the effectiveness of psychotherapeutic counseling by telephone.] (Germ) *Zeitschrift für Klinische Psychologie*, 1972, Vol 4(1), 323-334.—Examined the success factors of telephone counseling as they were exhibited in 36 10-min telephone conversations. Ss were 12 telephone counselors and 3 female clients who had prior instruction concerning the problems to be discussed. The performance of the counselors was recorded and judged by 18 neutral Os. Factor analysis produced 2 independent factors of significance: Empathy and Verbal Facility, both of which were highly correlated with the success of the counseling sessions as expressed by the clients' voiced satisfaction with the results and by their wish to contact the same counselor again in the future. (English summary)—T. Fisher.

### Physical Treatment

1817. Anoshian, Linda J.; Warren, David H. & Apkarian-Stielau, Pat. (U California, Riverside) **Progress after visual restoration: Two preliminary case reports and a request for communication.** *American Foundation for the Blind, Research Bulletin*, 1974(Apr), Vol 27, 310-312.—The literature on effective techniques of postoperative perceptual training and on psychological treatment of cases of visual restoration is limited. 2 case reports are reviewed and communication about other cases is requested.

1818. Briones, David F. & Rosenthal, Saul H. (U Texas, Medical School, San Antonio) **Changes in urinary free catecholamines and 17-ketosteroids with cerebral electrotherapy (electrosleep).** *Diseases of the Nervous System*, 1973(Jan), Vol 34(1), 57-58.—Studied changes in hormones and biogenic amines in 6 adult males as a result of cerebral electrotherapy (CET). Increases were found in total free catecholamines of urine taken over a 5-day course of CET; results with urinary 17-ketosteroids were mixed. It is hypothesized that these observations may be unrelated to amelioration of clinical symptoms following CET, but may result from hypothalamic or pituitary stimulation concomitant with CET therapy.—M. Oscar-Berman.

1819. Edwards, Allan E. & Hart, George M. (US Naval Hosp, Long Beach, CA) **Hyperbaric oxygenation and the cognitive functioning of the aged.** *Journal of the American Geriatrics Society*, 1974(Aug), Vol 22(8), 376-379.—20 healthy outpatients (average age, 67.9 yrs) suffering from memory lapses were given hyperbaric oxygen (100% at 2 atmospheres pressure) for 15 daily sessions of 2 hrs each. Comparison of pre- and posttest results on the Wechsler Adult Intelligence Scale revealed substantial improvement, particularly in tests concerned with short-term memory and visual organization. Ss who benefited most were those whose pretest Wechsler Memory Scale Quotients were between 70 and 110. There was no indication that the improvement reached a plateau after 15 sessions.—*Journal abstract.*

1820. Flemenbaum, A. (Texas Tech U, Medical School) **Cerebral electrotherapy (electrosleep): An open-clinical study with a six month follow-up.** *Psychosomatics*, 1974, Vol 15(1), 20-24.—Administered 5 electrosleep treatments to 25 patients with target symptoms of anxiety, depression, and insomnia, using Electrosone-50, a portable table-sized battery-powered apparatus mod-

eled after a Russian machine. Voltage was 15-25 volts. The group as a whole showed significant improvement as evaluated by psychiatric interviews, clinical global impressions, Zung depression scale, and self-rating on IDAM (Insomnia, Depression, Anxiety, and Miscellaneous) scale. Patients with previous psychotic episodes seemed to improve the most, contrary to previous reports. (19 ref)—A. S. Kulkarni.

1821. Miller, Michael B. (Nursing Home & Extended Care Facility of White Plains, NY) **Advanced occlusive arterial disease (gangrene) in the aged, and decision-making for amputation.** *Journal of the American Geriatrics Society*, 1974(Jul), Vol 22(7), 321-328.—Presents 4 case histories to illustrate how the decision regarding amputation of a gangrenous limb, which may be crucial to the patient's survival, can be influenced by the subjective attitudes of the patient's physician and family. It is felt that ethical values in the treatment of the mentally ill patient are in need of correction.

1822. Philpott, William H. (Fuller Memorial Hosp, S Attleboro, MA) **Sedac treatment, post sedac, response interference and electric shock.** *Diseases of the Nervous System*, 1973(Feb), Vol 34(2), 105-109.—Discusses the author's experiences in the use of Sedac treatment with neurotics, psychotics, and alcoholics. Long Time Sedac has been found useful for many types of responses, including insomnia, addictions, neuroses, and psychoses; Short Time Sedac (STS) treatments are often more effective than standard electric shock treatments. When electroconvulsive therapy (ECT) is used it is best to immediately follow it with a Sedac treatment, since this is more anxiety-relieving and to some degree clear of side effects of ECT. Either STS or ECT can be used as a pretreatment for orientation response inhibition therapy. ECT can also serve as the aversion (orientation response treatment itself. Both types of treatments raise the pain threshold and reduce the anticipation orientation. The treatment of choice for maximum value is a combination of STS followed by orientation response interference of verbally cued responses at the rate of 4 times/min for several minutes, followed by STS to insure anxiety inhibition at the end of treatment.—*Journal summary.*

### Social Casework & Rehabilitation

1823. Bauman, Gerald & Grunes, Ruth. (Lincoln Community Mental Health Ctr, New York, NY) **Psychiatric rehabilitation in the ghetto: An educational approach.** Lexington, KY: D.C. Heath, 1974. xx, 177 p.—Describes and evaluates the effectiveness of the Household Project, a 3-yr demonstration-research project aimed at developing services for former mental patients and their families in the inner city of New York. The nature of this educational approach to psychiatric rehabilitation and the special problems created by instituting a new human service program in a deprived and increasingly militant community are examined. (35 ref)

1824. Bender, Leonard F. (U Michigan, Medical School) **Prostheses and rehabilitation after arm amputation.** Springfield, MA: Charles C Thomas, 1974. xv, 179 p.—Presents comprehensive information about modern upper-extremity prostheses, and discusses causes of arm amputation, pre- and postoperative care and

rehabilitation, training for and with a prosthesis, and vocational and special considerations. (69 ref)

1825. Cohen, Charles. (Pittsburgh Public Schools, PA) **Rehabilitation counselors as needed school employees.** *Journal of Applied Rehabilitation Counseling*, 1974(Sum), Vol 5(2), 67-72.—Describes the utilization of 13 rehabilitation counselors hired by a public school system to give vocational counseling support to educable mentally retarded students attending vocational training courses. Steps in the counseling process are discussed, and the financial advantages of the program are examined.

1826. Friedlander, Walter A. & Apté, Robert Z. (U California, Berkeley) **Introduction to social welfare.** (4th ed). Englewood Cliffs, NJ: Prentice-Hall, 1974. xv, 560 p.—Presents a comprehensive description of the field of social welfare and social work, including the historical development of social welfare, social work processes, and social welfare programs and practices. Also discussed are the history of voluntary and public social services in the US; social work with groups; housing and the social environment; social work and correctional medical and mental health services; and professional education, practice, and issues in social work.

1827. Hafemann, Sarah F. & Chilman, Catherine S. (Milwaukee County Dept of Family Conciliation, WI) **Implications of vasectomy for social work practice.** *Social Casework*, 1974(Jun), Vol 55(6), 343-351.—Discusses medical, psychological, and social aspects of vasectomy. The medical procedure is relatively simple but a later reversal is difficult. Psychological aspects are important both in motivation and aftereffects. Vasectomy does not seem to be useful in treating frigidity, impotence, or premature ejaculation. Infidelity, divorce, and separation are likewise unaffected by the operation. Men do not appear pressured into the procedure. Public attitudes have steadily become more accepting of this birth-control method, but professionals now caution against its unadvised use. Implications for social workers include program planning and development, education, and pre- and postcounseling. Professionally prepared workers are important in providing quality services.—M. W. Linn.

1828. Hardy, Richard E. & Cull, John G. (Virginia Commonwealth U) **Severe disabilities: Social and rehabilitation approaches.** Springfield, IL: Charles C Thomas, 1974. xi, 317 p.—Discusses the problems of mentally retarded, epileptic, cerebral palsied, speech handicapped, blind, mentally ill, spinal cord injured, deaf, and diabetic persons, as well as rehabilitation work with those suffering from cancer, rheumatoid arthritis, heart disease, and pulmonary disability.

1829. Ince, Laurence P. (Ctr for Learning Disabilities, Briarwood, NY) **The rehabilitation medicine services.** Springfield, IL: Charles C Thomas, 1974. xvi, 576 p.—Discusses the roles and functions of the treatment disciplines which comprise the rehabilitation team. Among the topics detailed are the disorders and disabilities of rehabilitation patients; physical, occupational, and recreation therapies; speech and language therapy and auditory training; psychology, social work, and nursing, and vocational counseling.

1830. Lang, Judith . (Jewish Family Service, New York, NY) **Planned short-term treatment in a family agency.** *Social Casework*, 1974(Jun), Vol 55(6), 369-374.

—Discusses crisis intervention in a family service setting. Quick-response casework units offer immediate service using flexible modalities for treatment. A maximum 6-wk treatment period can effect change while families are motivated to resolve problems. Early, realistic goal-setting sharpens worker performance and supports family reintegration. The approach can reach clients who otherwise might be frustrated by longer, more traditional intake procedures.—*M. W. Linn*.

1831. Schlesinger, Lawrence E. & Frank, Donald . (National Children's Rehabilitation Ctr, Leesburg, VA) **From demonstration to dissemination: Gateways to employment for epileptics.** *Rehabilitation Literature*, 1974(Apr), Vol 35(4), 98-106.—Summarizes the procedures and results of a pilot project sponsored by the US Department of Labor in 1967-1968, which successfully demonstrated the positive outcomes of an intensified rehabilitation program for epileptics. Moribund for several years because of lack of interest, funds, or sponsorship, the concepts and techniques developed by the project have now been resurrected and are being applied in 5 Texas cities. A concerted effort to install such programs nationally is strongly advocated. (21 ref)—*S. L. Warren*.

1832. Weikel, William J. & Johnson, Richard H. (U Florida) **A simple model for identifying probable failures in a rehabilitation program.** *Journal of Applied Rehabilitation Counseling*, 1974(Sum), Vol 5(2), 106-111.—Describes a 9-step procedure for identifying potential client failures in any type of rehabilitation program. The 9 steps result in the assignment of predictive weights to various client variables (e.g., age, sex, and diagnosis). Examples of failure profiles are presented.

1833. Weisberg, Lillian M. **Casework with the terminally ill.** *Social Casework*, 1974(Jun), Vol 55(6), 337-342.—Discusses theory and relationships in casework with the terminally ill. Individuals are often left alone to face death. Professionals must involve themselves in this final crisis. Kubler-Ross has defined the stages of dying as denial, anger, bargaining, depression, and acceptance. A case history illustrating the process is presented. Catastrophic illness is regarded as an important social concern demanding new approaches in management. The interdisciplinary team is suggested as one type of management.—*M. W. Linn*.

#### Hospital Programs & Hospitalization & Institutionalization

1834. Alexander, E. R.; Hall, D. J. & Little, J. Crawford . (Ross Clinic, Aberdeen, Scotland) **Non-diagnostic prediction of behaviour and outcome in male psychiatric admissions.** *British Journal of Psychiatry*, 1974(Jun), Vol 124, 579-587.—Described preadmission personal and social characteristics and immediate precipitants of admission of 213 15-64 yr old male admissions to a psychiatric hospital. Both cooperative behavior while in the hospital and outcome are related to these preadmission nondiagnostic variables (e.g., employment history, marital status, criminal record, drinking problems, and living circumstances). It is suggested

that males who can statistically be predicted to behave badly and make little progress in the hospital should not be imposed on other patients and nurses in a general acute male admission ward.—*Journal summary*.

1835. Allekian, Constance . (Triton Junior Coll) **Intrusions of territory and personal space: An exploratory study of anxiety-inducing factors in hospitalized patients.** *International Journal of Psychiatry in Medicine*, 1974(Win), Vol 5(1), 27-39.—Defines territory as "an area of the hospital room which is claimed by the patient" and personal space as "an area extending outward to a distance of four feet from the person's body." According to a questionnaire administered to patients, intrusions on territory caused feelings of anxiety, but intrusions on personal space did not. Implications and limitations of the findings are discussed. (17 ref)—*R. M. Cohen*.

1836. Berman, Richard . (Bronx State Hosp, Williamsbridge-Fordham Unit, NY) **The social center: An experiment in aftercare.** *Journal of the Bronx State Hospital*, 1974(Spr), Vol 2(2), 82-85.—Describes a social center set up as an integral part of an outpatient clinic and designed to achieve a redevelopment of social skills and meaningful human relationships in its clients. The types of programs being used to assist outpatients in dealing with emotional difficulties encountered upon reentering the community are discussed.

1837. Black, Bertram J. & Chapple, Eliot D. (Albert Einstein Coll of Medicine, Yeshiva U) **Rehabilitation through productive participation: A stance for mental health services in the 1970's.** *Psychiatric Quarterly*, 1973, Vol 47(4), 521-532.—Argues that, just as the advent of the psychotropic drugs in the 1950s changed the emphasis in state hospitals from custodial care to an active treatment regimen, so the current experiments with therapeutic milieu approaches and community mental health practices can be brought to fruition in the 1970s by adoption of the principle of rehabilitation through "productive participation." It is stressed that mental hospitals must become rehabilitation enterprises as well as medical institutions, providing a whole spectrum of specialized services as part of the treatment regimen. Widespread demonstration programs to this effect are urged.—*Journal abstract*.

1838. Clark, David H. (Addenbrookes & Fulbourn Hosp, Cambridge, England) **Social therapy in psychiatry.** Middlesex, England: Penguin, 1974. 157 p. \$1.75.—Summarizes psychiatric discoveries and personal experiences over the last 20 yrs in the use of social measures in a hospital milieu to help people change to a state more tolerable to themselves and others. The history of treatment; application, success, and failure of new ideas; and the part that social science has played in increasing liberal attitudes in staff and patients are discussed. (38 ref)

1839. Craft, Michael . (Garth Anmarad, Penmaenpool, Wales) **A Welsh forensic psychiatric service for doctors.** *British Journal of Psychiatry*, 1974(May), Vol 124, 494-495.—Evaluates the results of treating psychopaths and other abnormal offenders at Garth, a mountain-top residential unit providing a therapeutic community for male court referrals, by tabulating outcomes for 300 persons. The number of reconvictions

was reduced, and more offenders were placed in training centers and in sheltered workshops.

1840. Easton, Karl. (Mount Sinai School of Medicine, City U New York) **Boerum Hill: A private long-term residential program for former mental patients.** *Hospital & Community Psychiatry*, 1974(Aug), Vol 25(8), 513-517.—Discusses the need for a wide variety of community living arrangements for former mental patients, and describes a private residential-care program founded by the author in New York City in 1966. The program includes the 196-bed Boerum Hill Home for Adults, which is certified by the state as a proprietary home and a community residence, and the Brooklyn Vocational Rehabilitation Institute, which conducts vocational training programs for former patients in clerical, food service, and home management areas.

1841. Evangelakis, Miltiades G. (South Florida State Hosp, Children's Div, Hollywood) **A manual for residential and day treatment of children.** Springfield, IL: Charles C Thomas, 1974. xv, 369 p. \$14.50.—Presents a guide for all professionals who work with children in an institutional or day-care setting. Topics include characteristic residential and day treatment centers; administration; methods of integration; functions and roles of the child study unit, child psychiatrist-residence chief, and social work and psychology services; paraprofessional duties; and required psychotherapy and nursing services.

1842. Fryers, T. (Dept of Community Medicine, Manchester, England) **Psychiatric inpatients in 1982: How many beds?** *Psychological Medicine*, 1974(May), Vol 4(2), 196-211.—Data collected by the Salford Psychiatric Case Register indicate that by 1982 total occupancy is likely to be about 2.3 beds/1,000 of the population, and about 1.7 beds/1,000 for long-stay patients (those remaining 1 yr or longer). 3 methods of projecting the accumulation of new long-stay patients are described. (18 ref)

1843. Glenn, Michael (Ed.). **Voices from the asylum.** New York, NY: Harper Colophon, 1974. xvii, 236 p. \$3.95.—After an account of methods of treating mentally ill patients in the past, current oppression and suffering in mental institutions is examined. Personal accounts of patients and staff are presented, and a patients' rights manual is included.

1844. Grob, Mollie C. & Singer, Judith E. **Adolescent patients in transition: Impact and outcome of psychiatric hospitalization.** New York, NY: Behavioral Publications, 1974. xvi, 202 p.—Reports a study of the effects of psychiatric hospitalization on adolescents and their families and their views of the experience and the types of preadmission, hospital, and posthospital variables related to functioning at follow-up. Data were obtained from interviews and observations of 36 male and 31 female 13-19 yr olds who were admitted to a small, private, psychoanalytically oriented psychiatric hospital in Massachusetts.

1845. Hayden, Teresa; Osborne, Alfred E.; Hall, Sharon M. & Hall, Robert G. (Kansas State U) **Behavioral effects of price changes in a token economy.** *Journal of Abnormal Psychology*, 1974 (Aug), Vol 83(4), 432-439.—A total of 33 male psychiatric patients who participated in a token system were exposed to changes

in the token price of available commodities in 2 experiments. In Exp I the price of cigarettes was first raised, then lowered. As predicted, consumption of cigarettes decreased during price increases and increased during price decreases. Contrary to expectations, Ss did not consume less of other commodities or increase their earnings in order to purchase cigarettes at the higher prices. In Exp II, which again raised and lowered the price of cigarettes, evidence was found for the notion that the proportional price change rather than the absolute price change governed cigarette consumption behavior.—*Journal abstract.*

1846. Herrera, Elizabeth G.; Lifson, Betty G.; Hartmann, Ernest & Solomon, Maida H. **A 10-yr follow-up of 55 hospitalized adolescents.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 769-774.—55 young adults (present ages 25-29 yrs) hospitalized for mental illness were followed up 10 yrs after their discharge as a sequel to 3 earlier follow-up studies. The majority of Ss were still poorly adjusted. The area of greatest competence was in school and work, whereas social relationships were almost universally inadequate. Preadmission variables most predictive of good long-range outcome were "chumship" and leadership experiences and healthy parental attitudes. The only therapeutic variables related to long-range outcome were those which described degree of illness. Evidence points strongly to the need for postdischarge vocational services for patients and therapy for parents. (27 ref)—*Journal abstract.*

1847. Karasu, Toksoz B. & Hertzman, Marc. (Albert Einstein Coll of Medicine, Bronx Municipal Hosp Ctr, Yeshiva U) **Notes on a contextual approach to medical ward consultation: The importance of social system mythology.** *International Journal of Psychiatry in Medicine*, 1974(Win), Vol 5(1), 41-49.—Proposes that the medical ward be viewed as a model of a "quasi-open community," in which a culture is transmitted from one generation of personnel to the next through a ward mythology which embodies ideals; e.g., it includes idealized roles for the nurse and doctor. Requests for psychiatric consultation often result from a partial breakdown in this mythology. Implications of this model for the consultant are discussed. Case examples illustrate the principles discussed. (14 ref)—*Journal abstract.*

1848. Kazdin, Alan. (Pennsylvania State U) **A review of token economy treatment modalities.** In D. Harshbarger & R. F. Mailey (Eds), *Behavior analysis and systems analysis: An integrative approach to mental health programs*. Kalamazoo, MI: Behaviordelia, 1974. ix, 403 p. \$14.95.—Presents a review of research on token economy systems emphasizing their effectiveness in dealing with symptomatic behaviors, social interaction of psychiatric patients, changes associated with token reinforcement, combined treatments, the role of punishment, transfer of training, response maintenance, and their social and organizational implications. Issues involved in staff training and the role of the community in token systems are also discussed. (9 p ref)

1849. Linscheid, Thomas R.; Malosky, Phyllis & Zimmerman, Joe. (Indiana U.—Purdue U., Indianapolis) **Discharge as the major consequence in a hospitalized patient's behavior management program: A case study.** *Behavior Therapy*, 1974(Jul), Vol. 5(4), 559-564.—De-

scribes a patient's token reinforcement system in which discharge itself was a purchasable reinforcer. Inclusion of discharge as a reinforcer requires those responsible for a patient objectively to define desired and undesired behaviors and then to convey this information to the patients.

1850. Milenkov, K. **Reasons for removing cases of manic-depression from the outpatient files.** *Foreign Psychiatry*, 1973-1974(Win), Vol 2(4), 72-77.—Analyzed the removal of 387 outpatient records from the files during 1967-1969 to determine reasons for removal. Almost half the cases had been removed because the patient died; 1/5 of the deaths were suicides. 27% of the files were removed because the patient recovered or experienced a prolonged lucid period. "Other reasons," chiefly change of residence, accounted for 27% of removals. Figures for men and women were about the same. The average age of suicides was 48 yrs; of those dead from other causes, 62 yrs; and of those recovered, about 48 yrs. Recommendations are made for improving the statistics by changes in record-keeping methods.—I. Davis.

1851. Milenkov, K. **The duration of outpatient follow-up supervision of manic-depressives.** *Foreign Psychiatry*, 1973-1974(Win), Vol 2(4), 67-71.—Analyzed the opinions of 965 Bulgarian psychiatric specialists as to the proper duration of supervision of manic-depressive outpatients. 62% of all specialists responding felt that supervision should continue throughout the life of the patient. 22% favored supervision for a period up to 10 yrs, about 12% favored a period up to 5 yrs, and only 2% felt that supervision should be discontinued after only 2 yrs. The implications of these findings for the maintenance of patient records in active vs inactive files are discussed. It is considered that no rigid formal time limit for patient supervision should apply; the time should be flexible and dependent on the individual case. In general, however, active supervision should continue for 2-5 yrs after the last psychotic attack; thereafter, it should be left to the patient to seek help if needed.—I. Davis.

1852. Miller, Kent S.; Simons, Ronald L. & Fein, Sara B. (Florida State U) **Compulsory mental hospitalization in England and Wales.** *Journal of Health & Social Behavior*, 1974(Jun), Vol 15(2), 151-156.—Analyzed data on formal admissions to mental hospitals in England and Wales from 1964 through 1970 in terms of variations over time, region, age, sex, and 1st or multiple admissions. Considerable variability was noted which was attributed to arbitrary administrative policy and highly individualized practices, rather than the behavior or needs of the patient. An argument is made for a critical review of the use of compulsory powers. (19 ref)

1853. Morgan, R.; Cheadle, A. J. & Staples, P. W. (St Wulstan's Hosp, Malvern, England) **Cash in hand.** *British Journal of Psychiatry*, 1974(May), Vol 124, 487-493.—Reports results of a 1972 change in the law which allowed patients' earnings in British hospitals to rise. In a sample of 157 patients, 26% showed an increased work output. Patients with 2 or more conditions and those receiving high doses of neuroleptic drugs showed less improvement in work.

1854. Orlando, Norma J. (Elgin State Hosp, IL) **The mental patient as therapeutic agent: Self-change,**

**power, and caring.** *Psychotherapy: Theory, Research & Practice*, 1974(Spr), Vol 11(1), 58-62.—Conducted a pilot study to see whether it was possible to train hospitalized mental patients to become therapeutic agents for their fellow patients. Ss were 3 chronic patients from a locked ward. Sessions between patients acting as therapists and clients were videotaped and the E instructed the therapists in attending, reflecting feelings, and avoiding judgments. The effectiveness of the training was evaluated qualitatively.—C. P. McCreary.

1855. Ozerengin, M. F. & Cowen, Murray A. (Marcy State Hosp, Research Services, NY) **Environmental noise level is a factor in the treatment of hospitalized schizophrenics.** *Diseases of the Nervous System*, 1974(May), Vol 35(5), 241-243.—2 groups of physically healthy schizophrenic patients (15 withdrawn and 15 actives with comparable sex and age distribution) were placed first in a quiet environment in which the noise level was kept between 40-60 db for 3 hrs each morning for 6 wks. Therapeutic, psychological, and clinical parameters were used to examine the effects of this particular environment. At the end of 6 wks, Ss were switched to a noisy environment where the noise level averaged 80-90 db. In the withdrawn group, the noisy environment produced increased motor and verbal performance, improved perceptual organization, and improved sleep pattern and hallucinations. As a result, overall improvement caused medication decrease. For the active group in a noisy environment, performance decreased and there was an increase in conceptual disorganization, anxiety, and restlessness, resulting in an increase of 40% in their medication. The withdrawn group in the quiet environment showed considerable regression with heightened autism, seclusiveness, more conceptual disorganization, and disturbed sleep patterns with increased hallucinations. The active group in the quiet environment showed improved performance, decreased anxiety, more conceptual organization, less hallucinations, and better sleep patterns; motor and verbal productivity increased.—*Journal abstract*.

1856. Perr, Irwin N. (Rutgers Medical School, Coll of Medicine & Dentistry of New Jersey, Piscataway) **Independent examination of patients hospitalized against their will.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 765-768.—The justification for legal commitment of the mentally ill has come under increasing public and professional scrutiny. While there have been few abuses or errors, certain types of problems are more likely to be reflected in unmerited hospitalization. 9 hospitalizations are reviewed in which an independent psychiatric examination was requested by a private attorney. In 3 of the 9 cases, mandatory hospitalization was not justified. Problem cases involved individuals with a history of mental illness, domestic or marital disputes, and organic mental illness—particularly those related to aging. It is stressed that examination at a later date may reflect the marked improvement that has occurred clinically rather than the symptom picture at the time of hospitalization.—*Journal abstract*.

1857. Rabiner, Charles J. & Lurie, Abraham. (Long Island Jewish—Hillside Medical Ctr, New Hyde Park, NY) **The case for psychiatric hospitalization.** *American Journal of Psychiatry*, 1974(Jul), Vol 131(7), 761-764.

—Indicates that the goal of psychiatric treatment is to restore the patient to a reasonable state of mental health. Hospitalization is often considered to be an unnecessarily expensive component of a total treatment program. It is argued that, in the zeal to reduce expense, many patients for whom hospitalization is indicated are either refused admission or are prematurely discharged. In certain cases the judicious use of hospitalization is suggested to be less costly in terms of the overall treatment program. Some of the other possible benefits to be gained from a period of hospitalization are cited.—*Journal abstract.*

1858. Rachlin, Stephen; Milton, Janet & Pam, Alvin. (Bronx State Hosp, Williamsbridge-Fordham Unit, NY) **The closed ward viewed longitudinally.** *Journal of the Bronx State Hospital*, 1974(Spr), Vol 2(2), 61-70.—Outlines the development of concepts and philosophy relative to the locked ward. Studies of elopement are reviewed which led, in part, to the opening of the Lincoln Intensive Care Unit (ICU). The history of the ICU, its patterns of use, and its operation are detailed. Follow-up data on the 50 patients who completed the treatment, and the advantages and problems associated with the closed setting form the basis for presentation of ideas as to how the hospital can be most responsive to the needs of those it serves. An attempt to reconcile a closed setting with current concepts of civil liberties is presented.—*Journal abstract.*

1859. Reimer, F. & Willis, E. (Weinsberg Municipal Psychiatric Hosp, W Germany) **[New trends in industrial work therapy in a psychiatric hospital.]** (Germ) *Nervenarzt*, 1972(Mar), Vol 43(3), 155-156.—Reports on the organization of the work therapy program in an 80-bed psychiatric hospital. Aspects described and discussed are the modernization of the intramural work therapy (involving a transition from simple, institution-centered crafts, gardening, and agricultural chores to industrial production techniques); assignment of patients to types of work and groups; the work-release program for jobs in nearby industrial enterprises; the remuneration, leave allowances, and other privileges of working patients; protection from abuse and exploitation; cooperation with coworkers, unions, and the community; and other problems and phases of the program.—*T. Fisher.*

1860. Rosenblatt, Aaron; Mayer, John E. & Pam, Alvin. (Bronx State Hosp, Social Science Section, NY) **Patients who return: A consideration of some neglected influences.** *Journal of the Bronx State Hospital*, 1974(Spr), Vol 2(2), 71-81.—Interviewed 30 mental patients who returned to the hospital in order to delineate some of the social processes leading to their return. Attention is focused on the influence of familiarity, hospitality, and the reduction of stigma. The consequences of hospitality on the goals of modern day treatment are discussed.—*Journal abstract.*

1861. Russo, J. Robert. (Southern Illinois U, Graduate School) **Mutually therapeutic interaction between mental patients and delinquents.** *Hospital & Community Psychiatry*, 1974(Aug), Vol 25(8), 531-533.—Describes a program in which juvenile delinquents from a correctional facility for boys visit patients in a state mental hospital. The program is designed to improve the delinquent's self-concepts by enabling them

to help others. For approximately 4 mo, the delinquents go to the hospital every other day to work with the patients in individual and group activities. A study of any changes that might have occurred in the patients was conducted using patients in the program and a control group of patients who did not participate. Staff ratings on the Psychotic Reaction Profile, a 12-item questionnaire on cleanliness and socialization, at the beginning and end of the 4-mo period show that the program patients were significantly improved, especially in the areas of cleanliness and sociability. Comparisons of participating and control delinquents show that the participants viewed themselves, their fathers, and the police significantly more positively than controls; there were no differences in academic performance.—*L. Gorsey.*

1862. Serban, George & Gldynski, Christina B. (New York U, Medical Ctr) **Significance of social demographic data for rehospitalization of schizophrenic patients.** *Journal of Health & Social Behavior*, 1974(Jun), Vol 15(2), 117-126.—Studied the social-demographic variables of education, marital status, employment history, and occupation of 70 acute and 349 chronic schizophrenics of both sexes in relation to readmission. None of these variables were significantly associated with readmission of acute schizophrenics. Among chronic patients, social-demographic index (combining the 4 variables) differentiated readmitted from nonreadmitted group, but further analyses revealed that only marital status and occupation contributed significantly to this differentiation. Although employment history did not appear to be related to readmission among chronic schizophrenics, dependence on welfare was particularly predictive of negative outcome. (21 ref)—*Journal abstract.*

1863. Turns, Danielle M. & Gruenberg, Ernest M. (Hudson River State Hosp, Epidemiology Research Unit, Poughkeepsie, NY) **An attendant is murdered: The state hospital responds.** *Psychiatric Quarterly*, 1973, Vol 47(4), 487-494.—Conducted a study of 80 patients in a mental hospital at the time of an attendant's murder by another patient, comparing their behavior and care patterns with those of 98 patients in a previous study. A before-and-after design was used, based on 4 indices reflecting the expected impact of the murder: (a) increase in transfers to closed wards, (b) decrease in releases and home leaves, (c) increase in tranquilizer usage, and (d) increase in admission social breakdown syndromes. Results show that none of the indices monitored reflected any major or lasting changes in the day-to-day functioning of the hospital. Some tentative explanations are offered.—*Journal abstract.*

## EDUCATIONAL PSYCHOLOGY

1864. Amiel-Lebigne, F. (National Ctr of Scientific Research, Sainte-Anne Hosp, Paris, France) **[Epidemiological study of psychological morbidity among teachers.]** (Fren) *Revue de Psychologie Appliquée*, 1974, Vol 24(1), 43-65.—Discusses attitudes toward teaching among professional female teachers in Paris. Ss dissatisfied with their choice of teaching as a profession showed significantly more maladjustment. The question is asked,

but left unanswered, whether the physical and psychological symptomatology reported resulted from the teaching environment or whether the teacher had the symptoms prior to entering the profession.—K. J. Hariman

1865. Brandtstädter, J., et al. (U. Trier-Kaiserslautern, Div. 1 of Psychology, W. Germany) [Design of heuristic-taxonomic models for structuring objectives in pedagogical and psychological research and theory.] (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol. 6(1), 1-18.—Presents a taxonomic scheme to delineate research and teaching objectives in educational psychology. The scheme, which was developed as a framework for a graduate program in educational psychology, is derived from theoretical and programmatic considerations concerning educational psychology as a science and profession. Used as a heuristic device, it facilitates the identification of curricular content areas and indicates a sequence of cognitive-behavioral modes which the student should apply to these content areas. (47 ref)—*English summary*.

1866. Carranza, Elibio. (California State U., San Jose) **Life changes and teacher performance.** *California Journal of Educational Research*, 1974(Mar), Vol. 25(2), 73-78. Investigated the effect of life changes (as measured by the Schedule of Recent Experience—SRE) on the performance of 110 high school teachers. Teacher performance measures included rate of absenteeism, requests for transfer, units earned beyond the BA degree, and distribution of student grades. Significant positive correlations were found between (a) SRE scores and teacher absenteeism due to illness, (b) SRE scores and the number of times the teacher changed residence, and (c) student drop-out rate and percentage of D's and F's distributed. Negative correlations were found between (a) SRE scores and units earned beyond the BA degree; (b) teacher performance units earned and absence due to illness, frequency of absence, and duration of absence; and (c) student drop-out rate and percentage of A's and B's distributed. Data support the hypothesis that life changes and teacher performance variables are significantly correlated and that large life changes are associated with less desirable aspects of performance.—L. Gorsey.

1867. Cowen, Emory L. & Lorion, Raymond P. (U Rochester) **Which kids are helped?** *Journal of Special Education*, 1974(Sum), Vol. 8(2), 187-192.—Describes the Primary Mental Health Project (PMHP), an innovative school mental health program that uses nonprofessional child-aides as direct help-agents with young poorly adjusted school children. Findings from a series of studies aimed at identifying children who are most and least helped by this type of intervention are presented. Younger, initially less maladapted, shy-withdrawn, relatively high socioeconomic status, suburban children improve most through the aide intervention. The relation of these findings to data on the effectiveness of other types of helping services and their implications for program modification are considered. (27 ref)—*Journal abstract*.

1868. Denton, David E. (Ed.). (U Kentucky) **Existentialism and phenomenology in education: Collected essays.** New York, NY: Teachers College Press, 1974. iii,

223 p. \$9.95.—Includes discussion of the work of J. Dewey and of M. Unamuno; the existential ground for aesthetic education; the relationship between literature, existentialism, and education; the multiple realities of schooling; and phenomenology and educational research.

1869. Dunkin, Michael J. & Biddle, Bruce J. (Macquarie U, Sydney, NSW, Australia) **The study of teaching.** New York, NY: Holt, Rinehart & Winston, 1974. xv, 490 p.—Presents an advanced text on research on teaching and methods and issues associated with the field and study of teaching. Topics include early research on teacher effectiveness, beliefs about teaching and teaching research, models for classroom teaching, methodological problems in classroom research, the classroom as a social system, patterns of classroom behavior, and recommendations for both teachers and researchers in the areas of theory, measurement, and practice. (19% p ref)

1870. Farley, Jennie. (Cornell U, New York State School of Industrial & Labor Relations) **Coeducation and college women.** *Cornell Journal of Social Relations*, 1974(Spring), Vol. 9(1), 87-97.—Data from a 1972 survey at Cornell University, which has been coeducational for 100 yrs, suggest that women undergraduates differ from their male classmates in ways which may be occupationally crippling. Evidence that Cornell women, as a group, report higher grade point averages than the men yet report themselves to be less intelligent than the men is presented, together with evidence that Cornell women still choose "women's fields." Suggestions for broadening women's perceptions of their own capabilities and for equalizing opportunities open to them are included. (29 ref)—*Journal abstract*.

1871. Fincher, Cameron. (U. Georgia, Inst. of Higher Education) **A minimax principle for educational research.** *Research in Higher Education*, 1974, Vol. 2(2), 99-107.—Suggests that educational research has lost considerable prestige in recent years and has been relegated to a defensive position. It is argued that in order for the findings of educational research to be more readily understood and widely accepted, researchers should pay more attention to the reduction of needless methodological complexity and to the improvement of conceptual clarity. To focus attention on this necessity, a minimax principle is suggested in which the educational researcher would minimize the maximum methodological complexity that is necessary to produce a satisfactory degree of conceptual clarity.—*Journal abstract*.

1872. Gagné, Robert M. (Florida State U) **Essentials of learning for instruction.** Hinsdale, IL: Dryden, 1974. viii, 164 p.—Discusses the basic facts and principles of human learning, illustrated with examples of learning in educational settings. Processes, outcomes, and conditions for learning are detailed, and the planning and delivering of instruction is discussed. (7 p ref)

1873. Gilmore, George E. (U Texas, Austin) **Models for school psychology: Dimensions, barriers, and implications.** *Journal of School Psychology*, 1974, Vol. 12(2), 95-101.—Argues that the development of school psychology may be seriously retarded unless a program is designed to overcome several hurdles: professional insecurity, nonlanguage, and awkward interprofessional

relationships. It is proposed that the models of school psychology—clinical, psychoeducational, educational programmer, systems-level problem solver, and preventive mental health—offer the potential but no guarantee that the profession will develop appropriately. (21 ref)  
—*Journal abstract.*

1874. Hannum, Wallace H. (Florida State U, Ctr for Educational Technology) **Toward a framework for task analysis.** *Educational Technology*, 1974(Feb), Vol 14(2), 57-58.—Offers a framework for viewing task analysis, based on the hypothesis that certain kinds of learning are necessary prerequisites to other kinds of learning and that tasks should be arranged hierarchically. Intellectual skills, motor skills, attitudes, and verbal information are discussed. The domain of cognitive strategies is thought to differ from these 4 domains in that it represents the learner's overall approach to managing the processes of attending, learning, remembering, and thinking. Thus, it is involved in the learning of tasks in the other 4 domains. The domain of the learning task should first be identified and then the appropriate task analysis procedure should be applied.—*R. S. Albin.*

1875. Karfiková, Svetla. (Pedagogical Research Inst, Bratislava, Czechoslovakia) [New teaching space for modern teaching technology.] (Slovak) *Jednotná Škola*, 1974(Mar), Vol 26(3), 249-259.—Suggests that school buildings be designed to be adaptable to future needs and changing pedagogical methods. Intensification of the teaching process means greater mental and physical stress for both student and teacher. Better working conditions and more flexible teaching space will compensate for stress by physically and technically providing a stimulating environment.

1876. Kushel, Gerald & Madon, Constant A. (C. W. Post Ctr, Long Island U) **Fact and folklore: Social and psychological foundations of teaching.** New York, NY: John Wiley & Sons, 1974. xiii, 178 p. \$8.95(cloth), \$4.95(paper).—Uses the case method to help the student of education distinguish sound teaching principles from unfounded opinion and folklore. Among the topics considered are today's student and alienation, disadvantaged youth, school-community relations, classroom management and the teaching process, and job satisfaction and teaching as a career.

1877. Malott, Richard W. **Contingency management in education.** Kalamazoo, MI: Behaviordelia, 1972. 253 p.—Presents an introduction to the principles of contingency management, and their applicability to education, in a comic book format. Principles of reinforcement, types of reinforcers, guidelines for effective studying, and the conceptual framework of behaviorism are examined.

1878. Robertshaw, C. Stuart & Johnson, Cathy A. (U Wisconsin, La Crosse) **The remedial contract: A facilitator of accountability in education.** *SALT: School Applications of Learning Theory*, 1974(Apr), Vol 6(3), 25-31.—Used a contract as facilitator of accountability with teaching personnel. S was a 5-yr-old male in a private preschool. A contract was designed that would pay for direct remedial services and train the parent to take over the services. At the end of the contract changes were evident in several areas for both the S and the parent.—*D. R. Marina.*

1879. Schmuck, Richard A. & Schmuck, Patricia A. (U Oregon) **A humanistic psychology of education: Making the school everybody's house.** Palo Alto, CA: National Press, 1974. xi, 388 p.—Presents a clarifying analysis of current psychological theories and research in education, and stresses that educational environments should be humanistic climates for learning. Means for changing learning climates, for applying systems theory to schools, and for humanizing learning groups are discussed. (12 p ref)

1880. Sluyter, Gary V. (Texas Dept of Mental Health & Mental Retardation, Houston) **Doctoral training in special education.** *College Student Journal*, 1974(Apr), Vol 8(2), 74-81.—Explores new approaches to the program of doctoral training in special education. The concept of flexibility in the requirements for a doctorate is emphasized. Phase 1 is the process of selecting the doctoral candidate, which should emphasize his intelligence, his empathic understanding of the range and problems of special education, and his spontaneous curiosity and originality. Phase 2 is the assignment of a temporary advisor for the candidate. Phase 3 is exploratory: the candidate learns about the many areas of special education. Phase 4 is the preliminary examination, which should bring out the strengths and weaknesses of the candidate. Phase 5 consists of the assignment of a permanent advisor who will assist the candidate in planning the remainder of his curriculum. Phase 6, the final one, includes appointment of the dissertation committee, construction of the dissertation, and the final defense of the written document.—*A. J. Ter Keurst.*

1881. Tibbetts, Sylvia L. (Bennett Elementary School, Green Cove Springs, Fla.) **The trouble with reading research.** *California Journal of Educational Research*, 1974(Mar), Vol. 25(2), 53-56.—Discusses problems encountered by the reader who is attempting to interpret studies on reading performance and program design. Difficulties which may be encountered in the areas of methodology, measurement, implications of results, and researcher's bias are described briefly.

1882. Velde, Philip B. & Kim, Hyung-chan. (Western Washington State Coll) **An analysis of perceptual-existential psychology and its implications for teacher education.** *Western Carolina University Journal of Education*, 1973(Fal), Vol 5(2), 5-15.—Critically analyzes humanistic psychology, or what A. Combs calls Third Force Psychology, in relation to new programs and ideas in teacher education. On the basis of personal analyses and observations, it is concluded that Third Force Psychology is not an alternative to behavioristic and/or Freudian psychology. Its validity as a scientific concept is considered questionable because of the obscure and emotional character of its terminology.—*J. Joesting.*

1883. Weintraub, Samuel; Robinson, Helen M.; Smith, Helen K. & Roser, Nancy. (Indiana U) **Summary of investigations relating to reading, July 1, 1972, to June 30, 1973.** *Reading Research Quarterly*, 1973-1974, Vol 9(3), 247-513.—Summarizes 369 reports in 6 major categories: (a) summaries of specific aspects of reading research; (b) teacher preparation and practice; (c) sociology of reading; (d) physiology and psychology of reading; (e) the teaching of reading; and (f) reading of atypical learners.

### School Administration & Educational Processes

1884. Ayers, Jerry B. (Tennessee Technological U) **Principals' perceptions of importance of reading readiness factors.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 666.—338 principals ranked the importance of 8 factors in pupils' beginning reading. Elementary principals ranked mental age, background, and emotional adjustment as most important, and nonelementary principals ranked mental age, vision, and desire to read as most important. Results are in agreement with other studies of teachers' perceptions of the importance of reading readiness factors.—*Author abstract*.

1885. Barry, G. Michael. (U West Florida, Educational Research & Development Ctr) **Evaluation technicians: Who are they? Who needs them?** *Educational Technology*, 1974(Feb), Vol 14(2), 49-51.—Presents a case for the need for competent, trained evaluation technicians on the local school level who can administer instruments, evaluate the results statistically, and do follow-up research. Especially with the increase of innovative programs each year, people to evaluate them are needed.—*R. S. Albin*.

1886. Battle, James. (Eastern Michigan U) **Reliability of college students' evaluation of instructors' competence.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1086.—Undergraduates rated their introductory psychology instructor on each of the 10 items of Battle's Instructor Evaluation Inventory and were readministered the inventory 48 hrs later. Results indicate that the items on the scale have acceptable test-retest stability and that Ss responded to the items in a consistent manner.

1887. Blass, Thomas. (U Maryland, Baltimore County) **Measurement of objectivity-subjectivity: Effects of tolerance for imbalance and grades on evaluations of teachers.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1199-1213.—Attempted to provide further validity for the personality construct of objectivity-subjectivity identified by T. Blass (1969) in the real-life setting of a teacher-evaluation procedure where objectivity of interpersonal evaluations is potentially at issue. 48 college students in introductory psychology completed a set of teacher-evaluation scales and the Blass Objectivity-Subjectivity Scale (BOSS) and stated their grade on a recently taken midterm examination. Results support the hypotheses that (a) there would be a positive relationship between grades and evaluations of the teacher for the group as a whole; and (b) this relationship would hold primarily for subjective persons (low BOSS scorers), but not for objective persons (high BOSS scorers). The relevance of the findings for the development of the personality construct of objectivity-subjectivity, personality correlates of differential tolerance for cognitive imbalance, and evaluations of teachers is discussed. (17 ref)—*Journal abstract*.

1888. Carrier, Neil A.; Howard, George S. & Miller, William G. (Southern Illinois U) **Course evaluation: When?** *Journal of Educational Psychology*, 1974(Aug), Vol 66(4), 609-613.—Data from 385 undergraduates support 2 hypotheses that students attending the last regular meeting of a college course in introductory psychology give more favorable instructor and course evaluations than those attending the final examination only. Data

pertinent to a 3rd hypothesis suggest that, relative to the last-meeting evaluations, the final examination context has little or no effect on ratings.—*Journal abstract*.

1889. Cassel, Russell N. & Todd, Leon W. (U Wisconsin, Milwaukee) **Comparing classroom climate with personal development for graduate and undergraduate college students.** *College Student Journal*, 1974(Apr), Vol 8(2), 38-45.—Investigated the relationship between humanism in the classroom and the personal development of the students. Humanism was measured by the College Assessment of Humanistic Psychology and the Class Activities Questionnaire. Student development was measured by the Test for Self-Esteem, Ego Development Scale, and Tennessee Self-Concept Scale. Ss were 89 lower-division and 65 upper-division students at a technical college, and 31 graduate students at a university. On the whole, no significant relationships were found between the 2 variables or between the sexes. A significant difference ( $p < .05$ ) appeared between classroom humanism and college levels. No significant differences occurred among the 13 part-scores of the 2 tests of classroom humanism or among the 10 part-scores of the 3 personal development tests (37. ref)—*A. J. Ter Keurst*.

1890. de Carlo, Julia E. & Madon, Constant A. (C. W. Post Ctr, Graduate School of Education, Long Island U) **Innovations in education for the seventies: Selected readings.** New York, NY: Behavioral Publications, 1973. xii, 276 p. \$9.95(cloth), \$4.95(paper).—Presents a collection of 23 articles on the advantages or disadvantages and implications of educational innovations. Topics include accountability in the classroom, educational philosophy and behavioral objectives, models and effects of differential staffing programs, education vouchers, individualized instruction, and open education.

1891. DIVPE Committee on the Changing Model of School Psychological Services. **A time for talking about psychological services in schools.** *Ontario Psychologist*, 1974(Apr), Vol 6(1), 23-27.—Presents a preliminary committee report clarifying the current status of psychology in Ontario education. It is recommended that (a) a detailed survey of psychological services in education be undertaken; (b) criteria be developed for services in a variety of settings; (c) legislation be studied to facilitate proposals for new legislation; (d) different levels of training and varieties of training settings be studied; and (e) research pertinent to evaluation of educational psychologists be encouraged.—*A. Krichev*.

1892. Furr, Karl D. (Toronto Board of Education, Ontario, Canada) **The school psychologist in the status hierarchy of school personnel.** *Ontario Psychologist*, 1974(Apr), Vol 6(1), 16-19.—58 teachers and educational administrators rated 20 educational positions on a 10-point scale as to the relative status, influence, and income the positions should have. The ratings were highly correlated with actual income level, except for "school psychologist," which was rated far higher than actual income would indicate. Findings support the view that the school system has the characteristics of a bureaucratic status hierarchy.—*A. Krichev*.

1893. Heichberger, Robert L. (State University Coll New York, Fredonia) **A humanistic approach to administrative-staff relationships: Link between theory and**

**practice.** *College Student Journal*, 1974(Apr), Vol 8(2), 3-32.—Treats the problems of human adjustment from the perspective of a personality theorist. The approaches and contributions of contemporary psychology are rejected, and the development of innate human nature, or "humanism," is presented in terms of universalism, individualism, social dependency, growth, quest for meaning, integration, and subjectivity. This list of traits is comparable to A. Maslow's hierarchy of motives. However, Maslow's need for actualization applies only to those few people who attain the goal of actualizing their abilities. Growth and goal-orientation are limitless. The role of the school principal that exemplifies these traits is extensively described in terms of his "humaneness," as an educator and as a manager of an educative organization.—A. J. Ter Keurst.

1894. **Howlett, Steve & Phills, George.** (London Board of Education, Ontario, Canada) **Professional development in education.** *Ontario Psychologist*, 1974(Apr), Vol 6(1), 28-32.—Presents a general model for preparing professional development programs for teachers. The model includes a statement of objectives, selection of format, implementation, follow-up, and evaluation. A program developed and operated on the basis of this model is described.

1895. **Krichev, Alan.** (Lakehead Board of Education, Thunder Bay, Ontario, Canada) **School psychology's problems in northwestern Ontario.** *Ontario Psychologist*, 1974(Apr), Vol 6(1), 20-22.—Describes some of the problems faced by school psychologists in an isolated urban area in northwestern Ontario. Weather is less a problem than is the multicultural, multilingual population. Other problems occur because the city is the social service center for an area of 500,000 sq mi. Educating the native Indians is a special problem.—*Journal abstract.*

1896. **Le Bouedec, Guy.** (Psychological Ctr, Angers, France) **[School structure and educational projects: A critical study of participation.]** (Fren) *Revue de Psychologie et des Sciences de l'Éducation*, 1973, Vol 8(3), 251-269.—Discusses an administrative structure established in 1968 by the French Ministry of Education to alleviate pupil dissatisfaction with secondary education by providing for pupil participation in decision making. The expected results did not come about and in 1971 an inquiry, conducted in 26 schools in western France, obtained 881 responses from pupils in the last year of secondary school. Results support the conclusion that pupils felt the participation actually permitted was less than that promised. Most pupils were indifferent or passive. It is held that responsible participation cannot be brought about by decree, since this involves an inherent contradiction. Research procedures concerning methods of achieving the desired end are outlined.—S. S. Marzoff.

1897. **Levenson, Hanna & LeUnes, Arnold.** (Texas A&M U) **Students' evaluation of an instructor: Effects of similarity of attitudes.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1074.—In a previous study K. C. Good and L. R. Good (see PA, Vol 51:7891) found that students who thought they were attitudinally similar to a hypothetical college instructor gave that instructor more positive ratings for personality and teaching competence than did dissimilar students. The present

study replicated Good and Good's study in a real-life teaching situation, using 136 college students in an introductory psychology class. Results replicate the positive correlation between attitude similarity and teacher personality ratings, but ratings of teaching competence were not influenced by attitude similarity—dissimilarity.—*Author abstract.*

1898. **Masendorf, Fredrich; Tscherner, Klaus & Tücke, Manfred.** (U. Dortmund, W. Germany) **[Cluster-analytical investigation of the teacher's judgment tendencies in the evaluation of the student's personality.]** (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol. 6(1), 19-27.—Asked 36 teachers to rate each of their students on a 25-item rating scale containing 5 judgment categories. Cluster analysis indicated 3 types of raters: 1 group of teachers tended towards severe judgments, another group towards especially mild judgments, and a 3rd (middle) group used average judgments. It is suggested that teachers with severe judgments are primarily oriented towards effectiveness and fulfillment of schooling requirements, whereas teachers with mild judgments are primarily guided by emotional satisfaction of their students.—*English summary.*

1899. **Maynard, Diane & Stammerman, James.** (U. Kentucky, Coll. of Education, Office of Research & Development) **An investigation into the role of the controller in institutions of higher education.** *Research in Higher Education*, 1974, Vol. 2(2), 165-171.—Examined the financial controller's perception of his role in institutions of higher education and whether that perception differs from that of top academic administrators. Questionnaires were administered to 36 controllers and 26 administrators. A modified Delphi technique was used to gather and refine data. Despite some minor disagreements, there was general agreement as to the proper role of the controller in institutions of higher education.—*Journal abstract.*

1900. **Misumi, Jyujii & Akune, Motomu.** (Kyushu U.) **[The effect of need for achievement, test anxiety and identification with teacher upon a pupil's perception of his teacher's leadership.]** (Japn) *Japanese Journal of Experimental Social Psychology*, 1972(Mar), Vol. 11(2), 159-169.—175 male and 175 female 6th graders completed questionnaires regarding their need for achievement (n-Ach), test anxiety, and identification with teacher. The teacher's leadership was measured by the performance-maintenance (PM) scale. Results of chi-square tests indicate that: (a) High n-Ach Ss perceived higher P (performance) function and higher M (maintenance) function of the teacher's leadership. (b) Low n-Ach Ss perceived lower P and M functions. (c) These findings were not supported in girls' perception of male teachers. (d) Test anxiety and identification with the teacher had no significant effect on the perception of teacher's leadership. (46 ref)—*Journal abstract.*

1901. **Noonan, J. Robert & Thibeault, Robert.** (Bingham Ctr, River Region Services, Louisville, KY) **Primary prevention in Appalachian Kentucky: Peer reinforcement of classroom attendance.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 260-264.—10 elementary and 25 high school students who were identified as chronic absentees participated in a contin-

agency management program in which an equal number of "popular" students were selected as reinforcing agents and assigned to each absentee. These "monitors" were required to observe when the target absentee did or did not attend school. When the target did attend, the monitors communicated that this was appreciated; when they were absent, the monitor contacted the target and sympathetically asked the reason for the absence and when they would return. The effects of this peer reinforcement program were analyzed in a 1- and 2-mo baseline treatment and follow-up assessment. Attendance rates of both the elementary and high school targets increased significantly between treatment and follow-up phases, and between baseline and follow-up phases. Individual trends in attendance patterns are noted, and implications for other difficult educational situations are discussed.—*L. Gorsey.*

1902. Richards, James M. (Johns Hopkins U, Ctr for Social Organization of Schools) "Environments" of British Commonwealth universities. *Journal of Educational Psychology*, 1974(Aug), Vol 66(4), 572-579.—Used some techniques developed for describing the "environments" of US universities to explore the correlation between national characteristics and university characteristics in the British Commonwealth. Because such techniques have been little used outside the US, their appropriateness for describing Commonwealth universities was examined first. Secondly, 1 of these techniques (based on J. L. Holland's theory of vocational behavior and occupational classifications) was used to examine the collegial organization of Cambridge University and Oxford University, England. Results for 186 universities suggest that these techniques are appropriate for characterizing Commonwealth universities, including Oxford and Cambridge colleges, and that national characteristics and university environments correlate fairly meaningfully in the Commonwealth. (23 ref)—*Journal abstract.*

1903. Shami, Mohammad A. & Hershkowitz, Martin. (Maryland State Dept of Education, Baltimore) Relative importance of "mastery of reading skills" as a goal of public education. *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 89-97.—Presents findings of a major study of educational goals and needs in Maryland. The goal "mastery of reading skills" was consistently rated the 1st or 2nd most important educational goal by all public groups at the state level and at all local school levels. Several questions of accountability attainment are discussed.

1904. Simpson, Richard L. (U North Carolina, Chapel Hill) Sex stereotypes of secondary school teaching subjects: Male and female status gains and losses. *Sociology of Education*, 1974(Sum), Vol 47(3), 388-398.—Data from a 1962-1963 mail survey of over 22,000 public school teachers in 2 southern states show that teachers considered different subject areas more appropriately taught by men or by women. In evaluating prestige of teachers of different subjects, they attributed higher prestige to whichever sex conformed to the subjects' sex stereotypes. Prestige attributions to men and women teachers, considered separately, varied with sex appropriateness of their fields. Nonconformists appeared to avoid adverse effects on satisfaction by

denying the stereotypes. Men's prestige varied more than women's with conformity to sex stereotypes. This last finding suggests that social norms concerning appropriate occupations may apply more strongly to men than to women because of the greater centrality of occupation as a component of male than of female sex-role images.—*Journal abstract.*

1905. Sullivan, Arthur M. & Skanes, Graham R. (Memorial U Newfoundland, St John's, Canada) Validity of student evaluation of teaching and the characteristics of successful instructors. *Journal of Educational Psychology*, 1974(Aug), Vol 66(4), 584-590.—Asked undergraduates in 10 1st-year courses to rate their instructors. The mean ratings for each class were correlated with the mean class mark on final, common, board-marked examinations. The mean correlation was +.39, and correlations were both positive and higher than +.32 in all but 2 of the courses. Correlations were higher for experienced full-time faculty members and lowest for inexperienced part-time instructors. Academically successful and highly evaluated instructors were both "task-oriented" and interest-arousing. Unsuccessful but highly evaluated instructors attempted to arouse interest without being task-oriented. However, electing to take subsequent courses in the subject and the level of achievement in these courses was more highly related to S's level of achievement in the 1st course than to evaluation of instructor.—*Journal abstract.*

1906. Wickett, Beatrice. (Ottawa Board of Education, Ontario, Canada) Investment and income: The use of volunteers and students. *Ontario Psychologist*, 1974(Apr), Vol 6(1), 33-35.—Describes 10 yrs of experience with volunteers serving as part of the support system for emotionally disturbed students, and with graduate students from psychology and other fields (e.g., criminology) serving internships or field placements within the schools. The "investment" is time and training which every school psychologist can afford. The "income" is greatly increased service to students, a profit needed by every school system.—*A. Krichev.*

#### Curriculum Development & Teaching Methods

1907. Berdie, Ralph F. (U. Minnesota) College courses and changes in dogmatism. *Research in Higher Education*, 1974, Vol. 2(2), 133-143.—To observe the impact of an experimental human relations course and to compare changes occurring in students in this course with changes in students having other university experiences, most entering freshmen ( $N = 5,159$ ) completed the Rokeach Dogmatism Scale before the beginning of the school year in 1970, and selected groups were retested at the end of the 1st quarter. Mean Dogmatism scores for all groups, including the experimental group ( $n = 84$ ), declined. Results did not suggest that the experimental course had a unique effect on dogmatism. Ss selecting varying college experiences differed extensively at both testing and retesting.—*Journal abstract.*

1908. Bjerstedt, Ake. Social development and training in school: Glimpses from two research projects. *Didaktometrie & Sociometrie*, 1974, Vol 6(1), 1-48.—Briefly describes 2 research projects with closely related aims: (a) social development and training in the comprehensive school and (b) coplanning of student democracy at

different educational levels. One overall purpose was to increase the possibilities of evaluating different attempts to promote the school's goals in social training (by adding to basic knowledge, improving measurements, and studying certain effects of educational influence). The work was carried out at the Malmö School of Education and has been described successively in about 80 reports and publications. These are listed in the present paper with abstracts or annotations.—*Journal abstract.*

1909. Bjerstedt, Ake . **Social development and training in the comprehensive school: Project summary and report abstracts.** *Pedagogisk Dokumentation*, 1974(May), No 27, 20 p.—Includes abstracts of 50 studies, focusing on the aspects of cooperation, resistance, and world citizen responsibility in the social development and training of students. Topics covered include construction and testing of measuring instruments, mapping of student development, and explorations of the use of educational influence.

1910. Bjerstedt, Ake . **Student democracy—co-planning at different educational levels: Project summary and report abstracts.** *Pedagogisk Dokumentation*, 1974(May), No 28, 16 p.—Summarizes a 3-part project which concentrated on innovative co-planning in Grades 1-6, Grades 7-12, and in teacher training. Abstracts of 30 published reports about the project are included.

1911. Cullen, John B. (Teacher's Coll, Columbia U) **On the methods, rationale and unanticipated consequences of Soviet atheistic "upbringing."** *Religious Education*, 1974(Jan), Vol 69(1), 72-87.—Developing in Soviet youth an atheistic world view is an explicitly stated goal of Soviet character education. Atheistic stages follow a developmental progression from unbeliever to convinced atheist to active atheist. Supplanting religious traditions and ceremonies with communist traditions that also appeal to the emotions is one pedagogical technique. Using aesthetics, as it relates to church music, art, and monuments, provides another technique whose aim is to lead to appreciation of such phenomena on secular grounds alone. 3 principles of religious secularization—eradication, creation, and innovation—bear upon changes in thought pattern of the atheist. Eradication involves loss of relevance of symbols of religion and their associated behaviors or experience. Creation involves association of existing behaviors or experiences with new symbols. Innovation involves association of an old symbol with new experiences or behaviors. By presenting the child with experiences similar to and psychologically equivalent to those found within religion, but associating these with new communist experiences, the Soviet program is currently innovative. The Soviets admit differential success and failure with different types of belief, and many empirical questions remain to be answered.—*E. Gavin.*

1912. Debenham, Jerry . (U Utah) **A computerized simulation game for studying the future of American education.** *Educational Technology*, 1974(Feb), Vol 14(2), 14-19.—Describes a new classroom game—Simulating Alternative Futures in Education (SAFE)—which tries to open the imagination of participants to future educational possibilities. Its specific objectives include

promoting realization of the potential usefulness of computers in educational decision-making, and of the potential usefulness of social indicators; and stressing the fact that there are competing priorities for limited resources, and that there may be alternative educational futures. SAFE has been played with over 200 students and faculty from the University of Utah. The objectives were generally met.—*R. S. Albin.*

1913. Dewey, John . **Religious education as conditioned by modern psychology and pedagogy.** *Religious Education*, 1974(Jan), Vol 69(1), 6-11.—Stresses the need to investigate and to develop religious experience in the context of the child's life, which is qualitatively different from that of the adult. Since religious knowledge and experience develop gradually, the entire record of a child's growth and development must be studied. Religious experience, like any other kind, should not be separated from the general psychology to which it belongs.—*E. Gavin.*

1914. Fisher, Harwood (Ed.). (City Coll, School of Education, City U New York) **Developments in high school psychology.** New York, NY: Behavioral Publications, 1974. xiv, 292 p. \$12.95.—Presents a series of studies which examine the current status and educational objectives of precollege psychology Teacher training, certification problems, and the funding of high school programs are discussed.

1915. Fishman, Joshua A. (Ed.). (Yeshiva U) **Advances in language planning.** The Hague, Netherlands: Mouton, 1974. 590 p. \$28.—Presents a collection of 24 theoretical and empirical studies on language planning policy, modernization, and education. Topics include cultural and cross-cultural linguistics and language issues, the theory and definition of language planning, language standardization in Africa, the effects of mass opinion on language policy, and problems in implementing a language policy.

1916. Garcia, Cirilo H. et al. (U Monterrey, Mexico) **[Differential effects of verbal praise, feedback of results, and verbal praise combined with feedback of results on the maintenance of arithmetic response rate.]** (Span) *Revista Interamericana de Psicologia*, 1974, Vol 8(1-2), 41-52.—Studied the role of verbal praise and feedback of results in maintaining and increasing arithmetic performance previously achieved by a combination of token economy, verbal praise, and feedback of results in 5 elementary school slow learners who were especially deficient in arithmetic performance. Verbal praise was an effective method for improving performance in 3 Ss and ineffective in 1 S. The remaining 5 showed an increase in performance as a function of time in all conditions. (English summary)—*S. Slak.*

1917. Hale, Robert E. & Camplse, Donald A. (St Louis U) **Assessing the effectiveness of a mastery teacher education program.** *Western Carolina University Journal of Education*, 1974(Win), Vol 5(3), 26-32.—Compared 30 student teachers trained in Mastery Method (M), based on Reinforcement Theory, with 30 trained in Lecture-Discussion Method (LD). M students used positive reinforcement more often, aversive stimuli less, and stimulated more student talk than LD students ( $p < .01$ ). Positive reinforcement was significantly

positively related ( $p < .01$ ), and aversive stimuli was inversely related ( $p < .01$ ) to amount of student talk.

1918. Hatch, Evelyn. (U California, Los Angeles) **Research on reading a second language.** *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 53-61.—Notes that the experimental research on reading a 2nd language is concerned with 3 questions: (a) Should initial reading be taught in the child's 1st language or in the 2nd language when the 2nd is the language of instruction? (b) What, other than "inadequate grasp of the language," accounts for slower reading speed and lowered comprehension when reading a 2nd language? (c) What are the most effective methods for teaching reading in a 2nd language? The literature contrasting the reading behavior of native and non-native speakers of English in each of these areas is reported and discussed. (27 ref)—*Journal abstract*.

1919. Ingersoll, Gary M. (Indiana U, School of Education) **An instructional decision-making model for individual differences in reading.** *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 77-88.—Points out that although reading educators repeatedly call for individualized instruction, little has been done to determine which instructional treatment is best for whom. The Trait by Treatment Interaction model, now used primarily as a research design, is suggested as a method whereby instructional decision makers can collect and compare data on the effectiveness of alternative forms of reading instruction for individuals of differing predispositions. An example of the types of questions that might be asked is provided. (15 ref)—*Journal abstract*.

1920. Kangas, Tove. (U Helsinki, Inst of Northern Philology, Finland) **[Choice of language of instruction—research or politics?]** (Finn) *Nordisk Psykologi*, 1973, Vol 25(2), 105-112.—Discusses bilingual children and their poor progress at school. Most of those examined belonged to emigrant families or to minority groups in which their language was subjugated, their socioeconomic status may have been below average and they may not have been instructed in their mother tongue. Most of these children were not genuinely bilingual, but rather semilingual. It is concluded that children in linguistic minority groups should be instructed in their mother tongue and that bilingualism should be allowed, as far as possible, for all children in minority and majority groups if they desire. (English summary)—*P. Mylov*.

1921. Lowerre, George F. & Scandura, Joseph M. **Conceptually based development and evaluation of individualized materials for critical reading based on logical inference.** *Reading Research Quarterly*, 1973-1974, Vol 9(2), 186-205.—Reports on the development of a systematic dimensional analysis technique for analyzing complex tasks applied to critical reading of paragraphs requiring use of logical inference rules. The difficulty of passages was identified using 5 levels. Prototype materials were tested using 2 dimensions which assessed Ss' ability to apply 2 logical inference rules. The materials were used successfully for diagnostic testing and training of 45 2nd-, 3rd-, and 4th-grade children. (French & Spanish abstracts) (26 ref)—*E. J. Mason*.

1922. Miller, Thomas E. (Auburn U) **An open system of planning for learning.** *Educational Technology*,

1974(Feb), Vol 14(2), 24-27.—Describes a system for helping students take responsibility for planning their own study programs. The system has 4 phases: identifying the need for learning, determining learning objectives, designing the learning situation, and evaluating learner progress. The system is a way for teachers to interact with learners. In determining learner need the context or setting of the need must be identified. Then a set of objective statements is derived and the requirements and constraints of the objectives can be determined. Continuous learner evaluation is recommended. 2 examples of the use of the system are given. —*R. S. Albin*.

1923. Morrison, Eleanor S. & Price, Milla U. (Michigan State U) **Values in sexuality: A new approach to sex education.** New York, NY: Hart, 1974. 219 p. \$7.50.—Presents a collection of teaching designs and exercises that allow high school and college students to openly explore and discuss their attitudes toward sex. Group exercises and games are presented for learning units on the physiology of sex, psychosexual development, sex roles, values clarification, nonmarital sex, and marriage and parenthood.

1924. Parker, Lorne A. (U Wisconsin Extension, Controlled Communications Systems, Madison) **Educational telephone network and subsidiary communications authorization: Educational media for continuing education in Wisconsin.** *Educational Technology*, 1974(Feb), Vol 14(2), 34-36.—Describes the use of telephones and radios for teaching adults in Wisconsin. Program advantages, processes, and evaluations are discussed.

1925. Saltz, Eli & Johnson, James. (Wayne State U, Ctr for the Study of Cognitive Processes) **Training for thematic-fantasy play in culturally disadvantaged children: Preliminary results.** *Journal of Educational Psychology*, 1974(Aug), Vol 66(4), 623-630.—Reports preliminary findings of a broader longitudinal study investigating the effects of fantasy-play intervention on socially and economically disadvantaged preschoolers. Young children directed in the role enactment of imaginary stories were significantly superior to control group youngsters on a number of measures of social and cognitive development. Fantasy-play training was significantly related to a higher incidence of spontaneous sociodramatic play and to higher scores on selected subtests of standard IQ tests, and it facilitated performance on Borke's Revised Interpersonal Perception Test. It also facilitated performance on tasks designed to measure story-sequence memory skills and story verbalization skills. However, fantasy play did not significantly enhance ability to recall pictures as opposed to objects. It is noted that fantasy-play training is a promising and practical intervention method enjoyed greatly by both the children and the adult interventionists. (15 ref)—*Journal abstract*.

1926. Silverman, Stuart & Phillips, Bronwen. (U South Florida) **Teaching color matching to a pre-school child.** *SALT: School Applications of Learning Theory*, 1974(Apr), Vol 6(3), 32-36.—Studied the effects on a boy 4½ yrs old of positive reinforcement and ignoring of incorrect responses in learning color matching. During programed training which broke the task into small steps responses were 91% correct.

1927. Tennyson, Robert D. & Boutwell, Richard C. (Florida State U, Computer Applications Lab) **Methodology for defining instance difficulty in concept teaching.** *Educational Technology*, 1974(Feb), Vol 14(2), 19-24.—Presents a method for analyzing instance probability in a 2-step procedure, to ensure quality control for selecting instances used by a teacher. The 1st step, subjective analysis, identifies the concept class by relevant attributes and makes sure that a range of difficulty of both relevant and irrelevant attributes is obtained when initially selecting instances. A sufficient number of instances is required so that examples and nonexamples used in the learning condition can be selected on predetermined definable variables. The empirical analysis validates the items according to the population for whom the instruction is intended.—R. S. Albin.

1928. Van Osdol, Bob M.; Johnson, Dale M. & Geiger, Leonard . (U Tulsa) **The effects of total body movement on reading achievement.** *Australian Journal of Mental Retardation*, 1974(Mar), Vol 3(1), 16-19.—Describes 4 of 38 grid games that were used to determine if total body movement would help improve the reading ability of 26 6-14 yr olds in elementary school who were experiencing reading problems. The Ss had been diagnosed as having learning disabilities on the basis of reading levels that were below grade levels and the Ss' inability to perform at a passing level in a regular classroom. For 16 wks an experimental and a control group were taught with the same instructional materials, content sequences, and time allotments. The experimental group was also given the total body movement exercises for 20 min each day, while the control group was given a placebo treatment that consisted of small group reading with assignments outside the regular classroom. Comparison of pre- and posttreatment scores on the Wide Range Achievement Tests indicate that the experimental group demonstrated a higher reading level than the control group at the end of the testing period. Results suggest that the total body movement treatment did enhance the reading ability of the students beyond the increase evident when traditional classroom methods are used.—M. Pounsel.

1929. Walcutt, Charles C.; Lampert, Joan & McCracken, Glenn . (Queens Coll, City U New York) **Teaching reading: A phonic/linguistic approach to developmental reading.** New York, NY: Macmillan, 1974. vii, 471 p.—Defines and describes the reading task as an introduction to reading instruction; discusses methods of evaluating reading readiness in the kindergarten year; outlines concepts for reading awareness; details methods of teaching reading for meaning, knowledge, and pleasure; and summarizes data from research in phonics and reading instruction. (17 p ref)

1930. Webster, William J. . (Dallas Independent School District, TX) **Performance contracting: The Dallas experience.** *Educational Technology*, 1974(Feb), Vol 14(2), 51-54.—Reports results of a performance contract in mathematics and communications classes, Grades 9-12, during the 1970-1971 academic year. Students in need of academic help—835 experimental Ss and 765 controls—were included in the project. Programmed instructional materials, student-controlled pacing, and immediate feedback were the essential features

of the program. Results failed to demonstrate any effect on student performance in either mathematics or communications.—R. S. Albin.

1931. Weir, W. Douglas & Jantz, Eleanore M. (U Maryland, Medical School, Baltimore) **Attitudinal grouping: A rationale for instructional grouping of medical students.** *Journal of Medical Education*, 1974(Aug), Vol 49(8), 785-786.—Describes the establishment of heterogeneous instructional groups of 1st-yr medical students based on their primary response pattern on the Strong Vocational Interest Blank (SVIB). Each group had a mixture of students representing high, medium, and low levels of interest in the 3 SVIB categories—Science, Human Behavior, and People People.

1932. Wiechel, Lennart . (U Malmö, School of Education, Sweden) **Sex-role perception as a barrier to cooperation: Assessment techniques and programs of educational influence.** *Didakometry & Sociometry*, 1973, Vol 5(1), 1-8.—Constructed instruments for assessing perception of sex roles and cooperation readiness, and 2 educational programs (used in the 4th and 6th grades) designed to increase equality between the sexes. With the help of analysis of variance, the effects of the specific educational influences, tests, school level, sex, and development during a final, noninfluenced period were studied in a total of 312 4th and 6th graders. In general, the older Ss showed a greater propensity to put the sex groups on an equal footing in attitudes, perception, and cooperation. Females were more prepared than males to assess the sex groups as equal. Groups exposed to influence underwent a change toward a greater degree of readiness to cooperate and showed an increased tendency to reject stereotyped traditional roles.—*Journal abstract*.

1933. Winett, Richard A. & Vachon, Edith M. (U Kentucky) **Group feedback and group contingencies in modifying behavior of fifth graders.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1283-1292.—Found that systematic feedback on performance based on ratings given to an entire 5th-grade creative arts class improved the appropriate behavior of all children sampled ( $n = 25$ ) compared to an untreated control class of 25 children, regardless of initial baseline level. Contingencies also applied to the entire class and based on the feedback-rating system resulted in further improvement. The procedures and results are discussed with reference to open classroom settings. (15 ref) —*Journal abstract*.

1934. Young, James C.; Bentley, Robert J. & Washington, Ernie . (Georgia State U) **Pitfalls of assessing young children: An overview.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Oct), Vol 2(1), 21-28.—Evaluates the goals of early childhood education programs and their relevance to the needs of disadvantaged children. The need to develop programs aimed at correcting environmental, rather than intellectual, deficits in a child's background is stressed. Research on the predictive validity of preschool programs is reviewed, and the importance of parental recognition and support of the educational program's goals and methods is discussed.

## Academic Learning &amp; Adjustment &amp; Achievement

1935. Anchor, Kenneth N. & Anchor, Felicia N. (George Peabody Coll for Teachers) **School failure and parental school involvement in an ethnically mixed school: A survey.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 265-267.—Investigated the relationship between school failure and parental involvement in school activities in an ethnically mixed lower middle-class urban junior high school. Data from 227 scheduled parent-teacher conferences with parents of male students (either high or low success students) indicate that parents of children with low academic success attended fewer conferences than parents of high-success children. This finding was more pronounced for Mexican-American parents. Possible alternatives to the present success-failure approach to education and its effects on student achievement are noted.—*Journal summary*.

1936. Bailey, Roger C. & Bailey, Kent G. (Oklahoma State U) **Self-perceptions of scholastic ability at four grade levels.** *Journal of Genetic Psychology*, 1974(Jun), Vol 124(2), 197-212.—Administered the Self-Rating Scale of Scholastic Ability and the Otis Quick-Scoring Mental Ability Test to 221 4th, 8th, and 12th graders and 120 college students. The Self-Rating Scale consisted of self- and other-student subscales. It was predicted that Ss' self-perceptions of their ability would become more congruent, stable, and realistic with increasing age. Progressive congruency and stability of self-perceptions were found from the 4th through the 12th grade, although a reversal of this trend was observed in the college sample. Several within-grade sex differences were noted, but little support was found for the prediction that older Ss would have more realistic self-perceptions. Results are interpreted in terms of a sex-role confusion in 4th graders and a more general identity confusion in 8th graders. Clear-cut role differentiation and high self-acceptance characterized 12th graders while prevailing sex stereotypes are suggested as an influence on the self- and other-student perceptions at the college level. (17 ref)—*Journal abstract*.

1937. Bandt, Phillip L.; Meara, Naomi M. & Schmidt, Lyle D. (New Coll) **A time to learn: A guide to academic and personal effectiveness.** New York, NY: Holt, Rinehart & Winston, 1974. xi, 241 p.—Presents a self-help manual for undergraduates to increase their academic and personal achievements and satisfaction. Topics include personal considerations in change and improvement, suggestions for improving textbook and classroom learning, using time effectively, preparing for examinations, facilitating independent study, self-analysis, and planning for the future. (8 p ref)

1938. Bauermeister, José J. & Colon Berlingeri, Nestor. (U Puerto Rico) **[Academic achievement as a function of trait anxiety level, sex, and general ability.]** (Span) *Revista Interamericana de Psicología*, 1974, Vol 8(1-2), 53-67.—Examined the relationship between trait anxiety, sex, general ability, and academic achievement in 142 female and 122 male 10th-grade 15-17 yr old students, using the State-Trait Anxiety Inventory, a Puerto Rican test of general ability, and grade point average. Low anxiety-trait Ss and female Ss showed higher academic achievement than high anxiety-trait Ss and male Ss. General ability was correlated with

academic achievement. Results are discussed in the context of C. D. Spielberger's theory of state and trait anxiety. (English summary) (29 ref)—*S. Slak*.

1939. Cooper, Martin. (U Ottawa, Ontario, Canada) **Factor analysis of measures of aptitude, intelligence, personality, and performance in high school subjects.** *Journal of Experimental Education*, 1974(Spr), Vol 42(3), 7-10.—Used factor analysis to demonstrate relationships among aptitude, intelligence, personality, and performance in high school subjects. Ss were 527 10th-grade students in 5 Ottawa high schools. Scores on the Differential Aptitude Tests, Henmon-Nelson Tests of Mental Ability, and Institute for Personality and Ability Testing, and High School Personality Questionnaire were obtained. School marks, standardized within schools, were used as measures of performance in 7 school subjects. The data were subjected to factor analysis, with oblique rotation to simple structure. 5 factors whose corresponding eigenvalues were greater than unity were obtained. 3 of these, loading on personality variables only, were identified as similar to R. B. Cattell's 2nd-order Factors I, II, and III. A 4th factor loaded on subtests of the Differential Aptitude Tests and Henmon-Nelson Test, and was identified as "verbal ability." This factor had only small loadings on school marks and personality traits. The final factor was loaded on the "academic" school subject marks, and was identified as "academic performance." The expected interrelations between aptitude, personality, and marks in various subjects did not produce factors which were composites of variables from each of these areas.—*Journal abstract*.

1940. Ellis, Robert A. & Manderscheid, Ronald W. (U Georgia) **A further note on the collegiate scholar: The question of value congruence.** *Sociology of Education*, 1974(Sum), Vol 47(3), 379-387.—A previous study by R. A. Ellis et al in 1971 which argued for the extension of the Clark-Trow typology of college student subcultures to include that of the collegiate scholar, rested entirely on data collected at a public university. The present study extended the data to include both undergraduates at a public university's honors college, a large prestigious private university, and lower-class youth in a Job Corps training program. Data show that those originally categorized as collegiate scholars closely resemble in value outlook their counterparts at Ivy League-type schools and, in turn, differ markedly from the Job Corps Ss. Findings strengthen the argument for conceiving collegiate scholars to be a distinct campus subculture rooted in elite traditions which emphasize that the purpose of college is to provide a well-rounded educational experience to prepare for future roles of leadership.—*Journal abstract*.

1941. Evans, Ron & Donnerstein, Edward. (Southern Illinois U.) **Some implications for psychological research of early versus late term participation by college subjects.** *Journal of Research in Personality*, 1974(Jun), Vol. 8(1), 102-109.—Several surveys of recent psychological literature have indicated that a large percentage of human Ss are introductory psychology students who are given the option of selecting when to participate in research which is either implicitly or explicitly required of them. The present study was conducted to investigate the possibility that those Ss who choose to participate

early in the term differ in personality and in attitudes toward research from later-term participants. A total of 31 male and 49 female early- or late-term experimental participants completed a battery of tests, including Rotter's Internal-External Control Scale and the Edwards Personal Preference Schedule. Results indicate that (a) early-term males and females, as expected, were more academically oriented and more internally controlled than late-term Ss; (b) early-term males were more achievement oriented than late-term males; (c) females felt more positive toward research participation than males; and (d) a large percentage of all Ss reported both suspiciousness of E intent and a general and unexpected willingness to voluntarily participate as Ss. Possible effects of these findings on research results and conclusions are discussed, and suggestions for improvements aimed at reducing self-selection bias in college S pools are made. (20 ref)—*Journal abstract*.

1942. Geis, George L. (McGill U, Montreal, Quebec, Canada) **Information about instruction: Before, during and after learning.** *Improving Human Performance*, 1974(Spr), Vol 3(1), 1-6.—Interviewed 12 college students about the information they sought and used before enrolling in a course, during instruction, and after instruction. Ss' responses indicated that they liked practical information about courses, many small ungraded tests, feedback which explained why they were wrong, and grading "on a curve." However, most Ss did not seem to know how to seek important information about learning and lacked the motivation to seek it.—*Journal abstract*.

1943. Good, Lawrence R. & Good, Katherine C. (Middle Tennessee State U) **Similarity of attitudes and attraction to a social organization.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1071-1073.—65 college students completed an attitude survey and subsequently received an attitude survey covering the same issues which purportedly represented the attitudes held by most of the members of a college fraternity or sorority. Ss then filled out a judgment scale calling for evaluations of the organization's likely feelings of belongingness, cooperative atmosphere, sense of group unity, and pride in the organization. In addition, they indicated how much they would probably like the fraternity or sorority and how much they would enjoy being a member. The hypothesized effect of attitude similarity on attraction was confirmed for both liking and desire to be a member. Perceptions of feelings of belongingness and cooperative atmosphere were also significantly influenced by similarity of attitudes.—*Journal abstract*.

1944. Hardy, Clifford A. (North Texas State U) **The junior college transfer: A study of college satisfaction, liberalism, and social class.** *Western Carolina University Journal of Education*, 1973(Fal), Vol 5(2), 28-32.—Compared 88 junior college transfer students with 90 native students on College Student Questionnaires. Results show that junior college transfers tended to be better satisfied than native students with the faculty and administration ( $p < .01$ ). No significant difference was found as to liberalism. Native students came from higher socioeconomic backgrounds than transfer students ( $p < .01$ ).—*J. Joesting*.

1945. Harris, Edward E. (Indiana U Purdue U, Indianapolis) **The teaching of sociological statistics revisited.** *College Student Journal*, 1974(Apr), Vol 8(2), 82-87. Refers to a previous study (1972) which found little support for the hypothesis that conceptual performance is a predictor of computational skills. The motivational problems of failing students are now considered in terms of the academic consequences of previous failures and the justification for repeating failed courses. 6 students who had received D grades in one course, and 11 who had received F grades in another course reviewed the subject matter, completed examinations, and received passing grades. Although the Ss did not apparently have superior intellectual abilities, the reduction of vitiating nonacademic factors, such as lack of motivation, led to acceptable grades after repetition of the previously failed courses.—*A. J. Ter Keurst*.

1946. Kaplan, Robert & Simmons, Francine G. (Bell Lab, New Brunswick, NJ) **Effects of instructional objectives used as orienting stimuli or as summary review upon prose learning.** *Journal of Educational Psychology*, 1974(Aug), Vol 66(4), 614-622. Placed instructional objectives before a text as orienting stimuli for selective attention or after a text as a summary review. 4 experimental treatments were examined: objectives presented before text with or without relevant information and objectives presented after text with or without relevant information. 300 10th-12th graders were Ss. 3 processes (repetition, selection, and search) were hypothesized to account for the results of the experimental treatments. Performance on information relevant to an objective was relatively high whether the objectives were presented before or after the text. Performance on incidental material was greater for objectives located after the text than before the text. More inspection time was consumed by the experimental groups than by a group that received no objectives.—*Journal abstract*.

1947. Kilpatrick, Dean G.; Dublin, William R. & Marcotte, David B. (Medical U South Carolina) **Personality, stress of the medical education process, and changes in affective mood state.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1215-1223. To evaluate the interrelationships of personality characteristics, stress of medical education, and affective mood state, 277 medical students were administered Rotter's Internal-External Control Scale and Profile of Mood States scale. Internal Ss consistently exhibited less mood disturbance than externally oriented Ss. Affective mood state varied considerably as a function of class year, with the junior year appearing to be the most stressful. Freshmen demonstrated increased mood disturbance after the first few months in medical school. A striking finding was the high level of anger and hostility in these Ss. Locus of control did not appear to change as had been predicted, suggesting that it is a relatively stable personality characteristic which might predict adverse emotional reactions in medical school.—*Journal abstract*.

1948. Leino, Anna L. **English school achievements and some student characteristics: II. On the relationships of motivational and auditory variables to English school achievements. Final analyses.** *Research Bulletin, Institute of Education, University of Helsinki*.

1974(Mar), No 40, 48 p.—Evaluated the effects of personality, intelligence, motivation, and auditory ability on the variance of school achievement in learning English as a foreign language. Finnish students in the 6th yr of English study (average age = 18 yrs) were administered a battery of tests including a questionnaire evaluating their rating of the English language as to its pleasantness, importance, and difficulty and instruments to measure attitude, interest, sound discrimination, sound-symbol association, and sense modality preference. Results show that Pleasantness of English was positively correlated, and difficulty of English negatively correlated, with almost all achievement variables. English language skills were best predicted by reasoning-type verbal intelligence and by the ease and pleasantness of the language as experienced by the students. Personality played only a minor role. (4% p ref)—*B. McLean.*

1949. McNinch, George. (U Southern Mississippi) **Awareness of aural and visual word boundary within a sample of first graders.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1127-1134.—Determined the relationships between awareness of visual and aural word boundary for 60 prereading 1st graders and the predictive quality of these perceptual tasks in relation to measured reading success at the end of the year. 2 informal, but previously used, word-boundary tasks were selected. Good, average, and poor reading readiness determinations were made using the Metropolitan Reading Readiness Test. Among the readiness groups, discrimination of aural word boundary did not discriminate performance. The covariance procedures indicated, however, that visual segmentation of word boundaries did discriminate among performance groups. Ss labeled high in readiness produced significantly more correct visual boundary perceptions that did the low-achieving readiness group. Regression models to predict end-of-year reading achievement by the prereading variables indicated that the word-boundary scores gave significant prediction. When considered as a unitary predictor, awareness and aural word boundary remained a predictor of reading achievement but awareness of visual boundary, when considered as a simple predictor, did not. Discrimination of visual boundary was not a readiness factor associated with later reading success.—*Journal abstract.*

1950. Nakamura, Masao. (Tohoku Woman's Coll, Sendai, Japan) **[The validity and underlying factors of scholastic traits.]** (Jpn) *Japanese Journal of Psychology*, 1974(Apr), Vol 45(1), 9-20.—Based on the theory that intellect and personality are subjective factors which determine academic achievement, the validity and underlying factor structure of 16 personality traits, termed "scholastic traits," was investigated. A 128-item questionnaire measuring 16 traits was administered to 3,739 high, average, and low achievers in Grades 1-9. Based on the correlations between each trait and academic achievement, 14 scholastic traits were identified as either "complete" or "semicomplete" as determined by a *t* test. 2 factors underlying the scholastic traits, Self-Adjustment and Emotional Introversion were extracted.—*English abstract.*

1951. Novotny, Elizabeth S. & Burstein, Mario. (Menninger Foundation, Topeka, KS) **Public school**

**adjustment of delinquent boys after release from a juvenile corrective institution.** *Journal of Youth & Adolescence*, 1974(Mar), Vol 3(1), 49-60.—Studied the public school adjustment of 94 delinquent boys after release from a juvenile corrective institution. 72% of the Ss returned to school in the community, but over 75% of these returners dropped out. Several factors associated with Ss' postrelease school adjustment were examined, with particular attention to the small group of 14 Ss who completed high school. A few personal and social factors were related to public school outcome (i.e., whether the Ss graduated or not). However, all of the Ss who finished high school had received some support from a structured environment or from interested people, in contrast to a majority of the Ss who dropped out. None of the Ss who graduated was involved in antisocial behavior while in school, and only 2 (14%) had gotten into serious legal trouble during the 3-yr followup in comparison to 40% of the Ss who dropped out and 50% of those who never attended school after release. 3 case studies are included.—*Journal abstract.*

1952. Rodewald, H. Keith & Carroll, James L. (Central Michigan U) **Problem in use of student ratings of faculty.** *Perceptual & Motor Skills*, 1974(Apr), Vol 38(2), 574.—Attempted to scale students' attitudes toward their professors. 8 items assumed to reflect important aspects of a professor's teaching ability were presented to 169 upperclassmen and graduate students. All items were presented as paired comparison stimuli. Much intransitivity of choice was noted, indicating that the Ss could not use the items consistently to establish a scale of desirable teaching characteristics.—*Author abstract.*

1953. Rystrom, Richard. (U Georgia) **Perceptions of vowel letter-sound relationships by first grade children.** *Reading Research Quarterly*, 1973-1974, Vol 9(2), 170-185.—Studied the processing strategies used by ordinary children in regular classrooms when they learn to connect letters with sounds. Black and white children were asked to write either an *a*, an *e*, or an *i* in a number of words. 1st graders did not appear to have strong preconceptions of letter-sound relationships when they entered school, but their year-end responses were significantly more like adult responses. No significant differences were found between the responses of speakers of black English and white English. (French & Spanish abstracts)—*Journal abstract.*

1954. Sassenrath, Julius M. & Maddux, Robert E. (U. California, Davis) **Language instruction, background, and development of disadvantaged kindergarten children.** *California Journal of Educational Research*, 1974(Mar), Vol. 25(2), 61-68.—98 disadvantaged kindergartners were grouped by sex, language background (English or English and Spanish) and language instruction method (Distar, Peabody Language Development Program, or Standard Method Language Development). Ss were pre- and posttested on the School Readiness Survey (SRS), the Wepman Auditory Discrimination Test (WADT), and the Illinois Test of Psycholinguistic Abilities (ITPA). A 2 × 3 analysis of covariance (covarying for pretest) was computed for each of the subtests of the SRS, WADT, and the ITPA. Results did not show consistent significant differences due to sex,

language background, or instructional method. Results of *t*-tests for correlated means, however, indicate that regardless of instructional method, sex, or background, Ss improved from pre- to posttest on almost all of the subtests of the SRS, WADT, and ITPA. It is concluded that intensive language development programs in kindergarten appear to be beneficial for disadvantaged children.—*Journal abstract.*

1955. Schultz, Charles B. & Pomerantz, Michael. (Trinity Coll, Hartford, CT) **Some problems in the application of achievement motivation to education: The assessment of motive to succeed and probability of success.** *Journal of Educational Psychology*, 1974(Aug), Vol 66(4), 599-608.—Administered 2 objective measures of motive to succeed, one used by H. J. Hermans and the other by A. Mehrabian to 93 male 9th graders. The preferences of motive-to-succeed (MS) and motive-to-avoid-failure (MAF) Ss for academic tasks which varied in difficulty were compared using individual and group standards for determining probability of success (PS). The biasing effect of MS and MAF on PS was also examined. Both MS instruments were multidimensional; they correlated with internal achievement responsibility for success and measures of academic achievement, and they were significantly related to each other. Hermans's was the more reliable test. The MS and MAF risk preferences were most consistent with theoretical expectations when group standards of PS were used. Overestimation of PS was directly related to MS. Both MS and MAF Ss overestimated PS more on difficult tasks than on easy tasks. (23 ref)—*Journal abstract.*

1956. Thorndike, Robert L. (Teachers Coll, Columbia U) **"Reading as reasoning."** *Reading Research Quarterly*, 1973-1974, Vol 9(2), 135-147.—Develops 3 lines of evidence relating to the proposition that performance in reading, at least after the basic decoding skills are mastered, is primarily an indicator of the general level of the individual's thinking and reasoning processes rather than a set of distinct and specialized skills. The evidence includes (a) results of factorial analyses of specific reading tasks, (b) the correlations between reading tasks and measures both of general intelligence and of later academic progress, and (c) the stability of difficulty in reading test items under translation from one language to another. The concept that reading is primarily a reasoning process may have implications for teaching reading and for education in general. (French & Spanish abstracts)—*Journal abstract.*

1957. Tuck, Mary G. (Cambridge Technical Coll, England) **The effect of different factors on the level of academic achievement in England and Wales.** *Social Science Research*, 1974(Jun), Vol 3(2), 141-149.—Studied the relative importance of 4 factors—ability, social class, sex, and type of school—on the performance of children in the educational system of England and Wales. A dummy variable linear regression analysis of data collected by the National Survey of Health and Development was used, tracing the progress of all children born in 1 wk of 1946. Findings show that reorganization of educational institutions can have considerable effect on children's performance, irrespective of their class and intelligence, and also that sex plays an increasingly

important determining role as pupils progress through the system.—*Journal abstract.*

1958. Watts, William A. & Stewart, Lawrence H. (U. California, Berkeley) **Correlates of activism in British students.** *California Journal of Educational Research*, 1974(Mar), Vol. 25(2), 87-102.—Investigated the applicability of the socialization hypothesis of student radicalism (i.e., that rather than rebelling against parents and other authority figures, student radicals are living out values inculcated by their parents) to 732 British students from grammar schools, modern and comprehensive secondary schools, and colleges and universities. Questionnaire responses indicated that 61 of the 732 reported having taken part in an organized protest because of an ideal and were classified as activists. 65% of the activists were male (vs 50% of the nonactivists). Consistent with the socialization hypothesis, the activists came from higher socioeconomic backgrounds than the nonactivists, and were more likely to perceive their parents as supportive of youthful protests than nonactivists. There was no tendency, however, for the activists to perceive their parents as more liberal or radical than did the nonactivists, and the activists' parents were not appreciably more interested in politics and international affairs. (24 ref)—*Journal abstract.*

1959. Welten, Wayne & Ettaugh, Claire. (Bradley U) **Lateral eye-movement consistency is related to academic aptitude.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1203-1206.—Measured the relationship between lateral eye movement and Scholastic Aptitude Test (SAT) performance in 36 right-handed undergraduates. Eye movements were videotaped while Ss answered a series of 48 questions and were classified into 1 of 4 categories: right, left, no response, or invalid (if S was not looking at E at the end of the question). Inconsistent movers had significantly lower SAT composite scores than did consistent right movers and left movers. Both male and female Ss displayed this pattern, although the difference between consistent and inconsistent movers was significant for females only ( $p < .05$ ). Further analyses showed that the superiority of the consistent movers held for both the Verbal and Mathematics subtests of the SAT. (15 ref)—*L. Gorsey.*

1960. White, William F. & McConnell, John. (U Georgia) **Affective responses and school achievement among 8th grade boys and girls.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1295-1301.—Administered the Junior Index of Motivation, the California Achievement Tests, and the Iowa Tests of Basic Skills to 267 8th graders in a small rural community. Significant small to moderate correlations ( $p < .01$ ) between the total motivational scale scores and achievement test scores were obtained. A factor analysis revealed that a factor labeled General Adequacy in the motivational scale contributed most to the achievement test scores.—*Journal abstract.*

1961. Ycas, Martynas A. & Pascal, Charles E. (McGill U, Ctr for Learning & Development, Montreal, Quebec, Canada) **Convergent, divergent, and esthetic ability and bias in college students: Their relation to personality and preference for major subject and instructional method.** *Improving Human Performance*, 1974(Spr), Vol 3(1), 22-37.—Examined the relationships

among measures of aesthetic preferences, divergent thinking, intelligence (convergent thinking), personality, and attitudes toward learning in 205 college students. Ss were administered a battery of tests—including the Barron-Welsh Revised Art Scale, Raven's Advanced Progressive Matrices, and the Omnibus Personality Inventory, Form F—and a form assessing attitudes toward 8 fields of study and 16 instructional methods. From the data analyses, it is concluded that divergence as a mode of thinking separating the creative from the science-oriented student is a consequence of its role as a secondary indicator of the aesthetic mode of thought, and that aesthetic preference reflects a fundamental mode of cognition. A large proportion of Ss had a substantial cognitive bias in aesthetic preference, enabling fairly accurate predictions of a wide variety of behaviors. (24 ref)—*B. McLean*.

### Special Education

1962. Aleamoni, Lawrence M. & Bowers, John E. (U. Illinois, Office of Instructional Resources, Measurement & Research Div.) **The evaluation of a special educational opportunities program for disadvantaged college students.** *Research in Higher Education*, 1974, Vol. 2(2), 151-164.—Analyzed the early academic achievement of disadvantaged, mainly black, students admitted to a university special educational opportunities program (SEOP) in the fall of 1968 and 1969. High school percentile rank and scores on the School and College Ability Test predicted the early overall academic performance of the 405 SEOP students. Validities, though significant, were not high and were possibly attenuated by use of too difficult test instruments and by inflated grading practices. Nevertheless, data indicate that recruitment people should not abandon customary merit selection based upon these types of measures. Test scores were found to be more valid for predicting the grade point average (GPA) of 9,796 regularly admitted students than for the GPA of SEOP students; the predictive effectiveness of high school percentile rank was greater for regularly admitted students.—*Journal abstract*.

1963. Andrews, R. J. & Andrews, Jeanette G. (U Queensland, Fred & Eleanor Schonell Educational Research Ctr, St Lucia, Australia) **Early education for mentally retarded children.** *Australian Journal of Mental Retardation*, 1974(Mar), Vol 3(1), 1-5.—Reviews selected United Kingdom early education programs for handicapped children that illustrate recent developments in the field. Some of the concepts of the nature of early childhood education considered important in the future development of services for the handicapped are discussed, and suggestions for a model of early education for the mentally retarded are presented.—*M. Pounsel*.

1964. Bieger, Elaine. (Reading & Diagnostic Ctr, Bronx, NY) **Effectiveness of visual perceptual training on reading skills of non-readers: An experimental study.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1147-1153.—Gave either perceptual training and remedial reading instruction or remedial instruction only to 48 2nd and 3rd grade nonreaders with visual perceptual deficiencies. Ss' progress was evaluated using the Marianne Frostig Developmental Test of Visual Percep-

tion, the Spache Diagnostic Reading Scales, and the Durrell Test for Discrimination of Words. After 7 mo, the Ss given visual training improved significantly in visual perception, but improvements were not reflected in reading achievement. Controls gained 8 mo in reading achievement vs 6 mo for the experimental Ss, indicating that visual perceptual training did not influence the achievement of reading skills for this group. (21 ref) —*Journal abstract*.

1965. Brown, Lou; Van Deventer, Pat; Johnson, Pat & Sontag, Ed. (Madison Public Schools, WI) **Teaching adolescent trainable level retarded students to read a restaurant menu.** *SALT: School Applications of Learning Theory*, 1974(Apr), Vol 6(3), 1-14.—Studied the learning of a teacher-made restaurant menu by 4 female trainable retarded adolescents. Ss were taught to label food pictures and word cards and later were able to choose from 15 items from a similar teacher-made menu at a restaurant.

1966. Carter, Ronald D. & Poeschel, Susan M. (U Wisconsin, Oshkosh) **Programming for severely disturbed youngsters in a public school.** *SALT: School Applications of Learning Theory*, 1974(Apr), Vol 6(3), 39-42.—Describes a program for autistic or schizophrenic children based on behavior modification theories. After a child is admitted to the program, a prescription is formulated detailing individualized instruction. Prescriptions are regularly reviewed, and revised or replaced as needed. Samples of improved behavior are given.—*D. R. Marina*.

1967. Coleman, Richard. (North Carolina Dept of Youth Development, Raleigh) **Response generalization in two categories of classroom behavior.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1167-1173.—Notes that although previous research has demonstrated that working behaviors and academic performance can be manipulated in classroom settings, generalization to one group of behaviors when the other group is being manipulated has not been sufficiently explored. The present study examined this possible generalization effect with 19 male adolescent institutionalized delinquents, randomly assigned to 2 groups. Programed instruction and a script economy were the treatment conditions. Group 1 was reinforced for working behavior while Group 2 was reinforced for academic performance. Programed instruction did not produce changes in either working or academic performance. Both groups showed increases in appropriate working behavior as a result of the script economy, with Group 1 showing the greatest change. A trend of improved achievement test scores was established for both groups, with Group 2 making slightly greater gains.—*Journal abstract*.

1968. Csapo, Marg. (U British Columbia, Research Unit for Exceptional Children, Vancouver, Canada) **From villain to class hero.** *Canadian Counsellor*, 1974(Apr), Vol 8(2), 112-120.—Notes that disturbed behaviors are often maintained by variables in the educational environment and that an effective classroom rehabilitation program involves the alteration of the variables which maintain inappropriate behaviors. An intervention plan designed for a 10-yr-old emotionally disturbed boy is described which included positive feedback for academic achievement and positive social

emotional feedback from the peers. The environmental variables were redesigned to promote success instead of failure and to gain acceptance instead of rejection. The intervention consisted of rewarding appropriate academic and social behaviors. Each time the S earned a point for himself he earned a point for the class towards a desirable class event. Results indicate that the alteration of feedback conditions resulted in alteration of behavior in the S, the teacher, and the peers. In the changed classroom environment the frequency of maladaptive behaviors decreased.—*Journal abstract.*

1969. Duckworth, Susanna V.; Ragland, Gilbert G.; Sommerfeld, Roy E. & Wyne, Marvin D. (Winthrop Coll) **Modification of conceptual impulsivity in retarded children.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 59-63.—105 educable mentally retarded (EMR) pupils in 9 primary-level classes who were found to be conceptually impulsive received 1 of 3 randomly assigned treatments: (a) visual discrimination training with extended teacher praise for correct responding, (b) visual discrimination training without extended verbal reinforcement, or (c) no specific intervention. Results using the class mean as the experimental unit support the prediction that impulsively responding young EMR pupils can be taught to delay responses and to make significantly fewer errors than similar pupils who receive no specific intervention. (27 ref)—*Journal abstract.*

1970. Flynn, Timothy M. (Southern Illinois U) **Regular-class adjustment of EMR students attending a part-time special education program.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 167-173.—Investigated the effect of a part-time special education program in promoting the personal and social development of elementary educable mentally retarded (EMR) students in the regular class. 122 teachers used a descriptive scale to rate 61 normal students in regular classes, 61 EMR students attending regular class part-time as well as a part-time special education program, and 61 students in regular class who were eligible for EMR class but put on the waiting list pending placement. The normal students were rated significantly higher than both EMR groups. No difference was found between the ratings of EMR special-class and EMR waiting-list students. (16 ref)—*Journal abstract.*

1971. Gampel, Dorothy H.; Gottlieb, Jay & Harrison, Robert H. (U Massachusetts, Boston) **Comparison of classroom behavior of special-class EMR, integrated EMR, low IQ, and nonretarded children.** *American Journal of Mental Deficiency*, 1974(Jul), Vol 79(1), 16-21.—Compared the classroom behavior of 12 segregated and 14 integrated educable mentally retarded (EMR) children—who were all formerly segregated and then randomly assigned to their present class placement—with that of 18 low-IQ children who had never been identified for special-class placements and 11 intellectually average children. The method was a time-sampling observational one, using 12 behavior categories. Data indicate that 4 mo after the school year began, the integrated EMR children behaved more similarly to nonlabeled EMR children than to their segregated peers. Results are discussed in terms of appropriate peer

models influencing classroom behavior of EMR children.—*Journal abstract.*

1972. Gottlieb, Jay; Cohen, Lenore & Goldstein, Laurie. (Research Inst for Educational Problems, Cambridge, MA) **Social contact and personal adjustment as variables relating to attitudes toward EMR children.** *Training School Bulletin*, 1974(May), Vol 71(1), 9-16.—Studied the attitudes of 284 intellectually average 3rd-6th graders toward educable mentally retarded (EMR) pupils, and replicated the study 4 mo later in schools serving and not serving EMR pupils ( $n = 114$  and 101 3rd and 4th graders, respectively). Both sets of findings indicate that attitudes toward EMR pupils were most favorable when the raters had little school contact with the EMR children. The 2nd purpose of the study was to test the prediction that well adjusted non-EMR pupils would express more favorable attitudes than poorly adjusted children. Results did not support this prediction. Results are discussed in terms of the difficulties of the contact hypothesis to predict attitudes toward retarded persons.—*Journal abstract.*

1973. Hewett, Frank M. & Forness, Steven R. (U California, Los Angeles) **Education of exceptional learners.** Boston, MA: Allyn & Bacon, 1974. ix, 464 p.—Presents an introduction to the background and contemporary practices of special education, similarities and differences in learning, ability, and social behaviors of 9 groups of exceptional children; and current practical and theoretical issues involved in the needs and education of exceptional children. (36% p ref)

1974. Holowinsky, Ivan Z. (Rutgers State U) **Special education in Eastern Europe: Oligophrenia and oligophrenopedagogy.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 205-208.—Discusses Soviet and Eastern European views of mental retardation (MR) and special education. The Soviet view of MR, known in the literature as oligophrenia, considers that MR is related to a maldevelopment or defect of the cortical hemispheres which leads to a pathological inertia of the central nervous system. 5 forms of oligophrenia have been identified and these are described. Data on Soviet studies of memory processes, differential diagnoses, and learning disorders related to MR are reported. Trends in oligophrenopedagogy (i.e., special education) are discussed. Physical education is emphasized, and special education programs are begun in the preschool years. As a whole, oligophrenopedagogy is based on a broad, qualitative assessment of abilities and actual achievement, rather than on standardized test performance.—*L. Gorsev.*

1975. Jones, Reginald L. & MacMillan, Donald L. (U California, Berkeley) **Special education in transition.** Boston, MA: Allyn & Bacon, 1974. xi, 464 p.—Includes discussion of the current significant shift in special education programming toward noncategorical models and procedures, issues and directions in psychological assessment of exceptional children, preschool programs, behavior modification, and the training of para- and semiprofessionals.

1976. Kokaska, Charles. (California State U, Long Beach) **The declassified retarded: Implications of the 1973 definition.** *Training School Bulletin*, 1974(May), Vol 71(1), 5-8.—Discusses H. J. Grossman's 1973

definition of mental retardation and its delineation of "significantly subaverage." Attention is directed to those students who no longer meet the revised definition of mental retardation and will be integrated into regular classes. 2 questions are presented about their integration, and 2 implications relative to the special educators responsibilities in the process are discussed. (16 ref)

1977. Mitra, Sudhansu B. (Coppin State Coll) **Language training for retarded-deaf children in a state institution.** *Training School Bulletin*, 1974(May), Vol 71(1), 41-48.—Describes an ongoing program in language training for a nonvocal group of 8 12-19 yr old retarded-deaf children at the Rosewood State Hospital School, Owings Mills, Maryland. Rating scales were used to evaluate the Ss' communication skills and classroom adjustment. A teacher rating form was also used to collect pre- and poststudy data for determining the efficacy of the program. Procedural steps are presented for teaching 3 different components of language skills (i.e., sentence structure, vocabulary, and reading comprehension). Data indicate that the program increased the vocabulary and the usage of words in phrases and sentences to statistically significant levels. Ss also showed substantial gains in reading in terms of grade levels. —*Journal abstract.*

1978. O'Grady, Donald J. (U Cincinnati) **Psycholinguistic abilities in learning-disabled, emotionally disturbed, and normal children.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 157-165.—Administered the Illinois Test of Psycholinguistic Abilities (ITPA) to 90 6-10 yr old children from 1 of 3 educational settings: learning-disabled, emotionally disturbed, and regular classes. Subgroupings within each educational setting were made on the basis of intelligence (either Stanford-Binet Intelligence Scale or Wechsler Intelligence Scale for Children scores) and social class. As a group, both learning-disabled and emotionally disturbed children were deficient in total ITPA abilities as compared with children in regular classes. The learning-disabled and emotionally disturbed children did not differ from each other in total ability. Total abilities were significantly related to intelligence but not to social class, regardless of educational placement. Children from a higher socioeconomic level performed better on auditory-vocal subtests. Disadvantaged children showed equal or superior performance on visual-motor subtests. Data suggest that individualized instruction, based on recognition of specific deficits, may be equally useful with children in regular classes or special classes for emotionally disturbed or learning-disabled children. (21 ref) —*Journal abstract.*

1979. Schulz, Jane B. (Western Carolina U) **Special Education: What makes it special?** *Western Carolina University Journal of Education*, 1974(Win), Vol 5(3), 19-21.—Instructional program for retarded children must have well-defined elements which meet specific needs of these children. 3 such elements are individualism, relevance, and student success. There are as many individual differences among retarded people as in any other group, and special education should help each child develop to his highest possible level. The retarded individual also needs an education that is relevant to

earning a living. The teacher should provide success for the students to encourage further progress.—*J. Joesting.*

1980. Stotsky, Bernard A.; Browne, Thomas & Philbrick, William A. (U Washington, Medical School) **A study of outcome of special schooling of emotionally disturbed children.** *Child Psychiatry & Human Development*, 1974(Spring), Vol 4(3), 131-150.—Evaluated the effects of special residential and day schooling experiences on 573 emotionally disturbed children, using specially constructed schedules, scales, and questionnaires with parents and records from the state department of education. Particular attention was given to such variables as successful and unsuccessful clinical and educational outcomes, age, sex, intellectual differences, residential vs day school placement, differences in diagnosis, degree of emotional disturbance at time of placement, and change in behavior or educational performance while at the special school. Most children derived benefit from the experience but a substantial minority did not.—*Journal abstract.*

1981. Streedbeck, Darlene & Pommer, Dale. (Problems-In-Living Ctr, Sioux Falls, SD) **The combination of positive reinforcement and time-out contingencies to control out-of-seat and accompanying disruptive behavior.** *SALT: School Applications of Learning Theory*, 1974(Apr), Vol 6(3), 15-24.—Ignoring out-of-seat behavior and the accompanying disruptive behavior had proved unsuccessful in eliminating or decreasing such behavior by an 8-yr-old girl in a special education program. A procedure was implemented which combined positive reinforcement for in-seat behavior with time-out contingency for out-of-seat behavior. After 3 wks, in-seat behavior had increased from 25% to 90%, and a recheck after 20 wks showed an increase to over 95%. —*Journal abstract.*

1982. Tsvetkova, L. S. (Moscow State U, USSR) **A consideration of basic approaches to the diagnosis of children with speech defects.** *Journal of Special Education*, 1974(Sum), Vol 8(2), 179-185.—Discusses problems in the education of children with speech deficits and proposes an approach to remedial education for these children, emphasizing a neurophysiological examination and evaluation of perception, memory, and representation processes. An experiment which investigated visual memory and constancy of images in normal and speech-impaired children is reported, showing that children with speech impairments exhibit underdeveloped visual memory and perception.

### Counseling & Measurement

1983. Anderson, Thomas H. (U Illinois) **Cloze measures as indices of achievement comprehension when learning from extended prose.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 83-92.—Conducted 2 experiments to test the hypothesis that cloze measures are a function of content achievement among adult learners and, consequently, should be sensitive to instructional treatments. College juniors and seniors took tests immediately before studying a prose passage (precondition), immediately afterward (postcondition), and 4 wks afterward (delay condition). The types of tests administered in each session were (a) a 20-item multiple-choice test, (b) a reproduction passage cloze test, (c) a

recognition passage cloze test, (d) a reproduction summary cloze test, and (e) a recognition summary cloze test. All tests showed significant differences between pre- and postconditions, and between recognition and reproduction modes. The reproduction summary cloze test was the most sensitive to the instructional treatment, as indicated by an  $\omega^2$  statistic on pre-post measures. The summary cloze tests were resistant to forgetting while the cloze passage and multiple-choice tests showed significant decreases in performance over the 4-wk delay interval.—*Journal abstract.*

1984. **Barnes, Edward J.** (National Inst of Education, Washington, DC) **IQ testing and minority school children: Imperatives for change.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Oct), Vol 2(1), 4-20.—Discusses errors in IQ test items, test norms, examining procedures, and language use which affect the placement of minority group children in school. The effects of IQ scores on teacher expectancies are discussed, stressing that teachers' mental sets are powerful influences on children's learning and performance and that IQ scores play a critical role in determining these sets. Problems in developing culture-free IQ tests are pointed out, and the advantages of developing alternative "culture-specific" tests are described. Statistical comparisons of black and white children's scores are questioned, since the comparative data are often used to limit opportunities for black children. Criterion-referenced tests appear to be a major breakthrough in ability testing, since they focus on growth and behaviorally-defined goals, rather than on setting white standards for black children. (24 ref)—*L. Gorsey.*

1985. **Beck, Michael D.** **Achievement test reliability as a function of pupil-response procedures.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 109-114.—Assessed the different effects on achievement test reliability of 2 pupil response procedures. Over 4,000 3rd- and 4th-grade pupils from 9 school systems took the Metropolitan Achievement Tests, half responding in the test booklets and half using separate answer folders. The 2 groups were matched by grade in general scholastic aptitude. Although the group using answer folders received lower scores than the group using the test booklets, the score reliabilities did not differ significantly for any test. Additionally, these reliabilities did not differ significantly from comparable Metropolitan normative reliabilities. For survey achievement tests such as Metropolitan, test reliability does not appear to depend on pupil response mode.—*Journal abstract.*

1986. **Bingham, William C. & House, Elaine W.** (Rutgers State U, Graduate School of Education) **Counselors' attitudes toward women and work.** *Vocational Guidance Quarterly*, 1973, Vol 22(1), 16-23.—To examine attitudes held by counselors regarding women and work, a 50-item attitudinal questionnaire was mailed to a 10% sample of secondary school counselors in a New Jersey State Department of Education directory. 126 usable questionnaires were received. It was found that on 8 attitudinal items there was general agreement, on 6 items opinions were divided, and on 11 items male and female counselors held different opinions. Reliability and validity estimates for this scale do not exist, and results are therefore tentative. The effects of counselors'

attitudes on their female clients are discussed.—*R. S. Albin.*

1987. **Boy, Angelo V.** (U New Hampshire) **Clients in the school.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses environmental variables in school counseling programs and the effects of these variables on student relationships to and interest in guidance services. Suggestions for counselor innovations in supervision, communication, and assessment in the school setting are presented, and the value of considering various counseling modes (e.g., individual or group) is discussed. (15 ref)

1988. **Brown, A. E. & Landrus, G. D.** (Toronto Board of Education, Ontario, Canada) **Early identification and development program.** *Ontario Psychologist*, 1974(Apr), Vol 6(1), 36-38.—Describes an early identification program with 3 main aspects: (a) screening kindergarten and 1st-grade pupils in terms of potential learning difficulties; (b) service to the child, family, and school staff; and (c) research on screening instruments. 35 schools now use the program and it is felt that the investment in time is well worth it. The preventive approach is seen as being more effective than any other.—*A. Krichev.*

1989. **Counts, George E.; DeClue, Maureen & Pace, Randy.** (Southeast Missouri State U) **Grades earned in repeated courses.** *Journal of Experimental Education*, 1974(Spr), Vol 42(3), 11-16.—Studied the pattern of 1,510 courses repeated by 885 students at a state university in the fall semester. Very few students repeated a course more than once. 2nd grades were in general better when the course was not repeated immediately but after 1 or more intervening semesters. The typical repeating student had a cumulative grade point average of about 2.10. A surprisingly large number of students repeated the course with the same instructor. Freshmen students were usually trying to improve an F grade; A, B, and C grades were much harder to earn, but more than 75% of the group received passing grades in the repeated course.—*Journal abstract.*

1990. **Elvers, Douglas A.** (U North Carolina, Chapel Hill) **Students face decision-making under uncertainty: The flexible grading system.** *Educational Technology*, 1974(Feb), Vol 14(2), 31-33.—Describes a university grading system in which the individual student decides, within certain restrictions, what relative weight is to be given to each of his examinations. Results, student opinions of the system, and recommendations for implementing it are discussed.

1991. **Feldt, Leonard S. & Forsyth, Robert A.** (U Iowa, Ctr for Measurement) **An examination of the context effect in item sampling.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 73-82.—Discusses item sampling and/or multiple matrix sampling techniques, which have been recommended for a variety of purposes. For some of these purposes, it must be assumed that examinee performance on a set of items is unaffected by the conditions under which the items are taken (i.e., that no context effect exists). Factors that may lead to a context effect among high school students are considered. The net effect of such factors on examinee scores for an English test and a mathematics

test was investigated empirically. For the mathematics test a definite context effect was found, but there was little evidence of its existence for the English test. (23 ref)  
—*Journal abstract.*

1992. Follman, John; Lucoff, Manny; Small, Leslie & Power, Fred. (U. South Florida, Coll. of Education) **Kinds of keys of student ratings of faculty teaching effectiveness.** *Research in Higher Education*, 1974, Vol. 2(2), 173-179.—Conducted 3 studies to examine the effects of different formats on undergraduate ratings of faculty teaching effectiveness. Study 1 investigated 3 main kinds of keys: Agreement, Evaluation, and Needs Improvement. Study 2 investigated numbers of positive rating categories, and Study 3 investigated the same items worded positively, negatively, and neutrally. Practically important differences in level of ratings were obtained in Study 1, and significant differences were obtained in Studies 2 and 3. It is concluded that additional research is necessary to determine if apparent differences in teaching effectiveness are actually due to the methods of measurement.—*Journal abstract.*

1993. Fowler, Robert L. & Thomas, Elizabeth S. (U. South Florida) **A comparison of the two-level and five-level grading systems in personalized instruction courses.** *Psychological Record*, 1974(Sum), Vol 24(3), 333-341.—Randomly assigned 48 members of a university educational psychology class to 1 of 2 conditions in a vestibule learning lab to determine which grading system used in personalized systems of instruction produces better performance. A 2-grade group received the maximum class points for mastering 4 units of material but no credit for mastering fewer than 4. A 5-grade group received 25% of the maximum points for each unit mastered. The groups differed on motivation and attitude measures but not on academic performance measures. More Ss in the 5-grade group than in the 2-grade group volunteered to participate in the project, viewed their system as fair, and said they would recommend their system to future students.—*Journal abstract.*

1994. Goldman, Roy D. & Richards, Regina. (U. California, Riverside) **The SAT prediction of grades for Mexican-American versus Anglo-American students at the University of California, Riverside.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 129-135.—Calculated the regression equations for 2nd quarter freshman grade point averages on Scholastic Aptitude Test (SAT) scores for Anglo-American and Mexican-American students. The equations differed significantly for the 2 groups. However, the use of the equation derived from the Anglo-American sample to predict grades of Mexican-American students resulted in overprediction. An examination of the standardized regression weights revealed a significant difference in the weight given to the Mexican-American SAT. A replication on a much larger sample revealed a similar outcome. Results are considered as a possible heuristic to suggest a scholastic "strategy" difference between the 2 ethnic groups.—*Journal abstract.*

1995. Greenwood, Gordon E.; Bridges, Charles M.; Ware, William B. & McLean, James E. (U. Florida) **Student evaluation of college teaching behaviors.** *Journal of Educational Measurement*, 1974(Sum), Vol

11(2), 141-143.—Describes the Student Evaluation of College Teaching Behaviors (SECTB), a newly developed instrument for student evaluation of teaching that (a) is empirically derived but reflects a broad conception of college instruction, (b) focuses on specific teaching behaviors, and (c) permits students to rate only those items which they consider relevant. In the SECTB the student must make a dichotomous choice between both negative and positive items. The instrument is seen as a move toward a more empirical approach to the evaluation of teaching.—*Journal summary.*

1996. Harper, Frederick D. (Howard U, School of Education) **Counseling the poor child.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Jan), Vol 1(2), 79-84.

1997. Healy, Charles. (U. California, Los Angeles) **Career counseling in the community college.** Springfield, IL: Charles C Thomas, 1974. xv, 140 p. 228.75(cloth), \$5.95(paper).—Describes 13 distinct, replicable counseling procedures for helping people make and implement career plans. Methods of measuring career development are discussed, and classes of counselor responses and career counseling criteria are outlined. (7 p ref)

1998. Hill, George E. (Ohio U) **Management and improvement of guidance.** (2nd ed). Englewood Cliffs, NJ: Prentice-Hall, 1974. xiv, 608 p.—Presents a practitioner-oriented text on the significance of guidance and its importance in school administration, methods of efficiently and effectively managing guidance programs, and recent problems and developments in guidance theory and practice. Topics include the qualities of effective guidance, determination of client needs, interrelationships between guidance and other pupil personnel services, the relationship between teachers and guidance counselors, and the use of tests in guidance programs.

1999. Hoepfner, Ralph. (U. California, Ctr for the Study of Evaluation, Los Angeles) **Published tests and the needs of educational accountability.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 103-109.—Matched consensual indexes of elementary education goal priorities and the availability of published tests that held promise for their assessment. A Q-sort was utilized to obtain priority ratings on 106 pre-established goals from a nation-wide sample. Independently, published tests for the elementary level were sorted into the same 106 goal categories. Results of the matching techniques indicate that most goals, whether high or low in priority, are measured by few or no published tests. This failure on the part of test publishers to respond to the needs of education is seen as an important contributor to the current popularity of criterion-referenced instruments.—*Journal abstract.*

2000. Kuznik, Anthony. (U. Minnesota, Technical Coll) **Qualifications and background of administrators of college placement tests.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Jul), Vol 1(4), 192-198.—Reports data from a questionnaire on the background and responsibilities of 2,332 American College Testing Program test center supervisors. 1,077 centers were in high schools and 995 were in colleges. 64% of the supervisors were in the fields of counseling and guidance, 19% were in educational administration,

and 14% were in teaching or testing. Mean years of experience in these fields was 8.69–10.72 yrs. 79% held master's degrees and 12% had either a PhD or an EdD, 77% of which had been awarded in either counseling and guidance or educational administration. 51% of the test centers administered the examinations to minority students, and had 1 or more minority group supervisors. Data for room supervisors and proctors and recommendations for minority recruitment are presented.—*L. Gorsey.*

2001. **Leard, Hugh M.** (McGill U, Montreal, Quebec, Canada) **The elementary counsellor and discipline.** *Canadian Counsellor*, 1974(Apr), Vol 8(2), 126–136.—Discusses the elementary school counselor's role as consultant to teachers whose students have behavioral problems. The question of discipline is discussed in terms of aspects of school functioning, teacher behavior as it pertains to classroom management, and individual psychology. Techniques are suggested for dealing with problem behaviors. (French summary)

2002. **Lindholm, Lena-Pia & Lundquist, Barbro.** (U Malmö, School of Education, Sweden) **Cooperation and independence: Studies of assessment techniques in observations of small groups.** *Didaktik & Sociometri*, 1973, Vol 5(1), 9–26.—Constructed and tested a system for assessing students' behavior in group-work situations (especially behaviors related to cooperation and independence). The basic data consist of videotape recordings of a total of 143 4th and 6th graders working in small groups. Results on O agreement are presented, and methods of making different kinds of observation data more comparable are examined. A validation study, an investigation of the connection between observation data and background data, and an analysis of structure are reported.—*Journal abstract.*

2003. **Ojha, A. B.** (Ministry of Defence, New Delhi, India) **The use of unfair means in university examinations: A form of protest.** *Indian Journal of Social Work*, 1974(Jan), Vol 34(4), 337–349.—Violent student agitation in India has affected practically all universities. Students' opinions about one form of violence was examined by asking them how they felt about the use of unfair means in university examinations. They were requested to state (a) their reactions in terms of perceptions and values, (b) their thoughts as to the reasons for the behavior, and (c) their suggestions for stopping the practice. 100 replies were analyzed. The main finding was that blame for what is happening on campus cannot be given entirely or primarily to students. Responsibility also falls on teachers, university officials, parents, and the present societal structure.—*I. W. Kidorf.*

2004. **Pettit, Neila T. & Cockriel, Irwin W.** (U Missouri, Coll of Education) **A factor study of the Literal Reading Comprehension Test and the Inferential Reading Comprehension Test.** *Journal of Reading Behavior*, 1974(Apr), Vol 6(1), 63–75.—Literal and inferential reading comprehension was assessed for 533 6th-grade students. The tests used are new instruments for measuring reading comprehension. 6 subscales are provided for literal reading comprehension and 5 subscales for inferential reading comprehension. The total data were factor analyzed using principal components and maximum likelihood procedures. Results

indicate that the 2 tests are measuring distinct factors. (31 ref)—*Journal abstract.*

2005. **Pohlmann, John T. & Beggs, Donald L.** (Southern Illinois U) **A study of the validity of self-reported measures of academic growth.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 115–119.—Obtained self-reported and pre-post measures of academic growth in 3 areas: simple cognitive, complex cognitive, and attitudinal. Ss were 162 graduate students enrolled in 6 graduate courses. Partial correlations relating self-reported measures of growth to posttest performance on measures of achievement (simple and complex cognitive) and attitude, controlling for pretest performance, indicated that self-reported measures were related primarily to growth in attitudes toward the subject matter of a course.—*Journal abstract.*

2006. **Priddle, Flora M.** **School psychological services: A parent's point of view.** *Ontario Psychologist*, 1974(Apr), Vol 6(1), 8–9.—Discusses the important role which school psychological services should play. While individual casework is not to be ignored, the school psychologist should be active in maintaining a mentally healthy school climate. Indirect consultation on administrative matters is essential, even though less visible. The most vital role of these services is that of guarding the mental health of the school.—*A. Kricher.*

2007. **Sanborn, Marshall P.** (U Wisconsin, Madison) **School counseling: Emphatically not a therapy service.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Presents postulates which differentiate counseling from psychotherapy. An attempt is made to clarify the school counselor's evaluation and coordination functions. A counselor interview with a 10th grader is presented to illustrate the school counselor's role.

2008. **Simpkins, Gary; Gunnings, Thomas & Kearney, Annette.** (Community of Mental Health, Cincinnati, OH) **The black six-hour retarded child.** *Journal of Non-White Concerns in Personnel & Guidance*, 1973(Oct), Vol 2(1), 29–34.—Suggests that the apparently "retarded" performance of many black children on standardized ability tests may be the child's way of adapting to a hostile, racist, and white-oriented educational and assessment system. Black children may often act out the retarded role in what is actually a self-fulfilling prophesy. The ways in which current educational criteria and programs in effect develop "retarded" children are discussed. Recommendations for eliminating the syndrome of the child who is considered retarded during the 6-hr school day are presented.—*L. Gorsey.*

2009. **Strang, Harold R.; Bridgeman, Brent & Carrico, Mary F.** (U Virginia) **Effects of "game" versus "test" task definition for third grade children on three subtests of the Wechsler Intelligence Scale for Children.** *Journal of Educational Measurement*, 1974(Sum), Vol 11(2), 125–128.—Assigned 46 male and 46 female 3rd graders to 1 of 2 experimental conditions. In Condition 1 Ss were told that they were going to take several tests and were then administered 3 subtests from the nonverbal battery of the WISC. In Condition 2 Ss were told that they were going to play several games and were then administered the same 3 subtests. An analysis of variance applied to the resulting summed scores revealed

1 significant main effect, task definition ( $p < .01$ ). While the experiment does not indicate why game instructions yield superior performance, a reasonable hypothesis would be that such instructions help to reduce stress.—*Journal abstract*.

2010. Tuinman, J. Jaap. (Indiana U) **Determining the passage dependency of comprehension questions in 5 major tests.** *Reading Research Quarterly*, 1973-1974, Vol 9(2), 206-223.—Investigated whether student performance on standardized tests of reading comprehension depended on whether the students had previously read the passages upon which the test questions were based. 5 tests were administered to 1,200 Ss each, in Grades 4-6, who read the passages and then answered the questions. The same tests were each administered to comparison groups of 600 Ss who did not read the passages. Both groups performed better than chance although the groups who read the passages did perform somewhat better. It is concluded that none of the reading tests studied was completely dependent upon having read the passages. Statistical methods for calculating passage dependency are proposed. (French & Spanish abstracts) (25 ref)—*E. J. Mason*.

2011. Wainer, Howard & Kaye, Kenneth. (U Chicago) **Multidimensional scaling of concept learning in an introductory course.** *Journal of Educational Psychology*, 1974(Aug), Vol 66(4), 591-598.—Using a model for individual differences in multidimensional scaling (INDSCAL), 16 concepts dealing with developmental psychology were scaled before and after a course with 45 undergraduates. 3 dimensions emerged, but 1 of them was relatively unimportant for the course. The postadministration indicated that this dimension was perceived as having lesser importance. The criterion measure used was the instructor's position in the subject space; movement toward him by the students was significant from pre- to postcourse administration. Implications of this methodology for educational evaluation are discussed.—*Journal abstract*.

## APPLIED PSYCHOLOGY

2012. Argyle, Michael. (U Oxford, England) **The social psychology of work.** Harmondsworth, England: Penguin, 1974. xi, 291 p. \$2.50.—Summarizes research on the social factors which affect the experience of work, traces the biological and historical origins of work, and compares alternative contemporary forms of work organization. Theories of motivation, leadership, training in social skills, and techniques of personnel selection are critically examined. (17 p ref)

2013. Bass, Frank M. & Wilkie, William L. (Purdue U., Krannert Graduate School of Industrial Administration) **A comparative analysis of attitudinal predictions of brand preference.** *Journal of Marketing Research*, 1973(Aug), Vol. 10(3), 262-269.—Assessed the impact of alternative analytical procedures on the results and conclusions drawn in studies of the multiattribute attitude model. Results show that cross-sectional analysis is especially vulnerable to response assumptions, and that importance weights not only do not suppress predictions but also improve the diagnosis of attitude

structure when the data are normalized. Illustrative data from univariate regressions of preference ranks of 2,000 female heads of household for 5 brands in 6 product classes against attitude scores are presented. Although the cross-sectional model does not obtain the predictive levels of within-individual analysis, results are comparable to those found in social psychological attitude studies. (33 ref)—*L. Gorsey*.

2014. Bass, Frank M. (Purdue U, Krannert Graduate School of Industrial Administration) **The theory of stochastic preference and brand switching.** *Journal of Marketing Research*, 1974(Feb), Vol 11(1), 1-20.—Considers that deterministic theories of behavior, specifically consumer choice behavior, are overemphasized in most empirical research, and introduces recent evidence which suggests that brand choice behavior is substantially stochastic. J. Hermiter's 1973 entropy model of brand switching under static conditions (i.e., when market shares are constant) is used as a basis for a proposed general theory of stochastic brand preference which accounts for brand choices and switches under market conditions of independence, brand loyalty, and static and dynamic market shares. The probability equations and functions underlying the theory are detailed, and an empirical test of the theory involving the choice of soft drink brands supports the conclusion that individual consumer choice behavior is substantially stochastic. Possible theoretical extensions of the theory are presented (e.g., multibrand buying or switching among substitute product classes). (17 ref)—*L. Gorsey*.

2015. Dallis, Constantine A. **Clients in business and industry.** In G. F. Farwell, N. R. Gamsky & F. Mathieu-Coughlan (Eds), *The counselor's handbook*. New York, NY: Intext, 1974. x, 530 p.—Discusses the role of the psychologist who practices within the business-industrial complex and how his work is influenced by organizational structure and employee characteristics. A suggested internship for counseling trainees in an industrial setting is described, opportunities for innovation in both industry and education are examined, and special considerations in supervision, communication, and performance appraisal in the business community are noted.

2016. Day, Richard H. (U Wisconsin, Mathematics Research Ctr) **System simulation: On system dynamics.** *Behavioral Science*, 1974(Jul), Vol 19(4), 260-271.—Presents an exegesis of J. W. Forrester's system dynamics using conventional mathematical concepts, and briefly reviews its advantages and disadvantages. 3 constructive suggestions—improved numerical integration methods, numerical control theory techniques, and a parameter-saving flexible class of smooth functions for representing nonlinear relationships—are made for augmenting the technology. (19 ref)

2017. Donnelly, James H. & Etzel, Michael J. (U. Kentucky) **Degrees of product newness and early trial.** *Journal of Marketing Research*, 1973(Aug), Vol. 10(3), 295-300.—Investigated the actual purchase of 3 groups of convenience products of varying degrees of newness. 20 products were used, and were designated as either "genuinely new," "marginally new," or "artificially new," depending on in how many of 4 evaluative dimensions (packaging, physical appearance, user prepa-

ration or use behavior, and technological processing) they differed from the nearest, previously available substitute. 250 housewives were administered Pettigrew's Category Width Scale and were asked to report which of the products they had purchased. Data support a general hypothesis relating breadth of categorization to new product trial, and indicate that different groups of individuals may be "innovators" for different products depending on the product's attributes (i.e., how similar or dissimilar the product is relative to previous offerings). Attributes of the product may be as important as behavioral and demographic factors in identifying early triers. (21 ref)—*L. Gorsey.*

2018. Farley, John U. & Ring, L. Winston. (Columbia U) "Empirical" specification of a buyer behavior model. *Journal of Marketing Research*, 1974(Feb), Vol 11(1), 89-96.—Attempted to specify a comprehensive buyer behavior model using Automatic Interaction Detector (AID) and canonical correlation analyses of data from 693 members of a consumer panel in terms of 11 endogenous and 17 exogenous variables, representing a mixture of product-specific and brand-specific measures and buyer characteristics. Constructs of either method of analysis are examined, and issues involved in consumer behavior measurement methodologies are discussed.

2019. Fisher, Allan H.; Orend, Richard J. & Rigg, Leslie S. Career potential among ROTC enrollees: A comparison of 1972 and 1973 survey results. Alexandria, VA: Air Force Human Resources Lab, Manpower Development Branch, MR 74-4, 1973. 124 p.—Results of a survey of Reserve Officers Training Corps (ROTC) cadets show that a majority were willing to continue into the advanced program, sought opportunities for further academic education, and would have entered the ROTC without a scholarship or subsistence allowance.

2020. Glickman, Albert S. & Brown, Zenia H. (American Inst for Research, Washington, DC) *Changing schedules of work: Patterns and implications*. Kalamazoo, MI: W. E. Upjohn Inst for Employment Research, 1974. viii, 104 p.—Discusses concepts, values, and uses of free time in current labor-leisure trends; case studies concerned with arrangements of and problems associated with new patterns of work time; individual adjustment and organizational change; and the roles of business, labor, government, and social institutions in influencing and planning work-time flexibility. (8 p ref)

2021. Herniter, Jerome D. (Boston U) A comparison of the Entropy model and the Hendry model. *Journal of Marketing Research*, 1974(Feb), Vol 11(1), 21-29.—Presents a theoretical comparison of the author's 1973 Entropy model of consumer purchase behavior and the Hendry 1966 model of consumer dynamics, emphasizing that information on the Hendry model is not complete and that comparisons are made in terms of market conditions in which advertising, price, distribution, market segmentation, and purchase frequency have no effects. The models are examined for their predictions of total switching, joint probabilities, and conditional probabilities for 2-, 3-, and 4-brand markets. A major difference between the models is that an increase in the number of brands in the market is accompanied by minimal change in total switching in the Hendry model,

whereas in the Entropy model it yields a significant increase in total switching. The relative fit of empirical data to each model is also detailed.—*L. Gorsey.*

2022. Johansson, Charles B. & Flint, Robert T. (National Computer Systems, Minneapolis, MN) *Vocational preferences of policemen*. *Vocational Guidance Quarterly*, 1973, Vol 22(1), 40-42.—Analyzed the vocational preferences of 275 police officers and police recruits who were administered the Strong Vocational Interest Blank. Results indicate that policemen had vocational interests that were militaristic, mechanical, and risky. They had strong preference for authoritarian-structured types of activity. Although the interests of recruits were similar to those of policemen, these preferences were not as strong as those of the officers until the recruits had been on the job for at least 1 yr.—*R. S. Albin.*

2023. Kolb, David A.; Rubin, Irwin M. & McIntyre, James M. (Massachusetts Inst of Technology) *Organizational psychology: An experiential approach*. (2nd ed). Englewood Cliffs, NJ: Prentice-Hall, 1974. x, 422 p.—Presents a textbook which communicates general psychological principles and the skills to apply that knowledge to social and organizational situations. Among the topics considered are interpersonal perception, communication, leadership, intergroup relations, organizational structure, and personal growth and career development.

2024. Kraft, Frederic B.; Granbols, Donald H. & Summers, John O. (Wichita State U.) *Brand evaluation and brand choice: A longitudinal study*. *Journal of Marketing Research*, 1973(Aug), Vol. 10(3), 235-241.—Tested whether a measure based on evaluations of brand attributes is predictive of brands purchased over time, and compared the predictiveness of this summated measure with an overall 7-point rating scale, brand first mentioned, last brand purchased, and favorite brand. 173 housewives were administered a brand attitude questionnaire at the beginning of the 16-wk test period. Ss then kept weekly diaries of their purchase of 8 products, 3 of which were actually being assessed. Analyses of brand choice in terms of "market share" measures and comparisons of purchasers and nonpurchasers show that the summated index was highly related in the aggregate to brands purchased over the 16 wks. It correctly predicted the brand most frequently purchased in about 1/3 of the cases for each of the 3 product categories studied. It is concluded that when prediction is the primary criterion, the summated index performs as well but no better than other measures, and may be less useful because of response ambiguities and complex design and scoring procedures. (18 ref)—*L. Gorsey.*

2025. Mizumoto, Kiyoshi et al. (JASDF Aeromedical Lab, Tokyo, Japan) [Studies on pilot's visual characteristics on detecting other airplanes: I.] (Japn) *Reports of Aeromedical Laboratory, JASDF*, 1973(Jun), Vol 14(1), 30-41.—Investigated characteristics of a pilot's eye movements when detecting approaching aircraft, using an eye-mark recorder. Results show that (a) in many cases, the pilot could not detect the approaching plane even if it subtended 1° 36" of the visual arc; (b) a plane approaching from a 0° (head on) or 120° direction was hard to detect; (c) when the pilot had information about

the direction of the approaching plane he could detect it from farther away than when he had no information; and (d) the most typical eye movements used to detect the plane were first horizontal scanning and then vertical searching.—*English abstract.*

2026. Nakanishi, Masao. (U. California, Los Angeles) **Advertising and promotion effects on consumer response to new products.** *Journal of Marketing Research*, 1973(Aug), Vol. 10(3), 242-249. —Describes a stochastic model of consumer response to new products which incorporates the effects of over-time variations in advertising and promotion. An empirical application of the model to the introduction of a new brand of catsup by TV network and spot commercials and to a direct mail campaign is presented. Data suggest that each advertising medium has different effects on the trial and repeat purchase rates and on the existence of differences in buyer characteristics between those who bought the product early and those who bought it late in the campaign. The model's primary usefulness appears to lie in its ability to generate conditional forecasts of product sales to evaluate alternative marketing programs for new product introduction.—*Journal abstract.*

2027. Platt, Anthony & Pollock, Randi. (U. California, School of Criminology, Berkeley) **Channeling lawyers: The careers of public defenders.** *Issues in Criminology*, 1974(Spring), Vol. 9(1), 1-31. —Studied the career characteristics and attitudes of 122 attorneys who worked in a California Public Defender's office between 1927 and 1971. The Alameda County Public Defender's Office (PDO) is described, and the recruitment, background, motivations, aspirations, and career processes of the attorneys are detailed. During the 1950's, motivation and careers of the attorneys began to follow a general pattern: most recruits were male, white, from working and lower-middle class origins, and Protestant and liberal political backgrounds. The PDO was regarded as a place to develop technical skills, and few attorneys planned to make their career in the PDO. Implications of the relationship between the state government, the legal profession, and public service, and factors in the disillusioning atmosphere of the PDO which discouraged many lawyers who planned to enter public service are discussed. (41 ref)—*L. Gorsey.*

2028. Ritchie, J. R. (U. Laval, Quebec, Canada) **An exploratory analysis of the nature and extent of individual differences in perception.** *Journal of Marketing Research*, 1974(Feb), Vol. 11(1), 41-49. —Investigated the extent of individual differences in consumer perceptions of 12 leisure activities and the degree to which these differences are real or simply a function of error in the method of data collection. The measure used to define an individual's perception was his weighting of different dimensions obtained from J. Carroll and J. Chang's individual differences (INDSCAL) model. A consumer panel of 200 females in a Canadian city was used to obtain 6 types of data on 12 leisure activities: similarity/dissimilarity judgments, criteria of similarity judgments, preference data, bipolar scales describing stimuli, familiarity with stimuli, and Rokeach Value Survey scores. Results show that (a) differences in perception among Ss were significantly greater than chance, (b) 5 perceptual segments were identified as best describing the range of

perceptions found in the sample, and (c) these perceptual segments did not significantly differ in their familiarity with the stimuli, personal values, or demographic variables. (28 ref)—*L. Gorsey.*

2029. Savoyant, Alain. (National Ctr for Scientific Research, École Pratique des Hautes Études, Lab of Industrial Psychology, Paris, France) **[Components of a situational analytic framework for problem-solving by work-shifts.]** (Fren) *Année Psychologique*, 1974, Vol. 74(1), 219-237. —Discusses the components of an analytic framework and the need for a high degree of coordinated integration of complex activities. The study of concrete work situations is considered essential for improving the analytic framework. (29 ref)

2030. Schussel, Robert. (Lehigh County Community Coll) **Circularity of vocational interests: Spherical analysis of VIP items.** *Measurement & Evaluation in Guidance*, 1974(Jul), Vol. 7(2), 86-91. —A. Roe (1956) and J. L. Holland (1969) have suggested that interest categories are ordered in a circular configuration and have felt that this model would be helpful in explaining changes in vocational behavior. Spatial configuration analysis has confirmed that the internal structural relationships of scales from several different interest inventories are similar and do conform to the circular ordering proposed by Roe and Holland. The present study attempted to (a) explain R. C. Tryon's (see PA, Vol. 41:8928) spherical analysis and show that spatial configuration analysis is a special case of Tryon's method and (b) determine if items from the Vocational Interest Profile (VIP) conform to previous results obtained from a spatial configuration analysis of the VIP scales. Spherical analysis confirmed the ordering effect of items for 1,058 males, but a U-shaped configuration instead of a circular one was found. Results for 655 females were difficult to interpret and suggest that females did not respond to the items in the same manner as males.—*Journal abstract.*

2031. Toenjes, Carol M. & Borgen, Fred H. (Iowa State U) **Validity generalization of Holland's hexagonal model.** *Measurement & Evaluation in Guidance*, 1974(Jul), Vol. 7(2), 79-85. —Tested J. L. Holland's 1959 hexagonal model for 6 occupational groups (Realistic, Investigative, Artistic, Social, Enterprising, and Conventional) with data on estimated occupational rewards. Data on rated occupational reward characteristics were available for 148 occupations. Factor analysis was performed to indicate the structure of the 21 reward dimensions, then the occupations were grouped into Holland's 6 classes. Of the 21 reward dimensions, 15 were significantly different across the groups; the groups were also significantly different at the overall multivariate level using discriminant analysis. The 6 groups were plotted in a discriminant space formed by the reward dimensions. Although the hexagonal shape was distorted, the groups were arrayed in the order postulated by Holland. The study indicates the robustness of the Holland hexagonal model with a new methodology and new data (i.e., the measured reward conditions of occupations themselves). —*Journal abstract.*

2032. Toness, Xenia; Suziedelis, Antanas & Lorr, Maurice. (American Assn of Medical Coll, Washington, DC) **Vocational interest types of men-in-general.**

*Measurement & Evaluation in Guidance*, 1974(Jul), Vol 7(2), 74-78.—Sought to identify, by typological analysis, the number and characteristics of vocational interest groups among men in general. On 3 randomly drawn samples, each of 120 Ss, from the Strong Vocational Interest Blank men-in-general standardization pool, records were scored for 14 previously isolated factors of interests. The resulting profiles were intercorrelated and then grouped by typological procedures. Analyses yielded 7 replicable interest types. 5 corresponded closely to J. L. Holland's Realistic, Investigative, Social, Enterprising, and Artistic groups; 2 had relatively undifferentiated profiles of high and low elevation. Occupations of Ss comprising 2 types—Realistic and Investigative—were highly distinctive. Occupational representation within the other 5 groups was broad and varied.—*Journal abstract*.

2033. Walker, Orville C. & Sauter, Richard F. (U Minnesota) **Consumer preferences for alternative retail credit terms: A concept test of the effects of consumer legislation.** *Journal of Marketing Research*, 1974(Feb), Vol 11(1), 70-78.—Investigated (a) consumer sensitivity to variations in finance rates compared to their sensitivity to the price of merchandise, down payment size, and size of monthly payments and (b) variations in credit term preferences among consumers with different demographic characteristics. Significant differences in preferences were found among upper- and lower-income respondents which were also related to educational level, occupation, marital status, and income. Implications for retail management, and advantages of the concept testing methodology are discussed.

2034. Wilsted, William D. & Hand, Herbert H. (U Colorado) **Determinants of aspiration levels in a simulated goal setting environment of the firm.** *Academy of Management Journal*, 1974(Mar), Vol 17(1), 172-177.—Graduate business students played a computer-simulated competitive business management game to test the hypothesis that previous performance, previous goals, and competitor's performance can be used as predictors of future aspiration levels in a simulated firm environment. Results support the hypothesis and the validity of the macro-organization theory of goal-setting in a simulated environment. (18 ref)

### Occupational Guidance & Personnel Selection & Training

2035. Baizerman, Michael & Cooper, Nicholas C. (U Minnesota, Ctr for Youth Development & Research) **Working youths: Select findings from an exploratory study.** *Journal of Youth & Adolescence*, 1974(Mar), Vol 3(1), 7-16.—Reports findings from an exploratory study of 272 16-22 yr old working youths who were either (a) interviewed in depth using an open-ended questionnaire about their self-concept, occupation, housing, leisure time, and politics; (b) interviewed in a group of 11 other youths, or (c) interviewed on the streets of the inner city. Data presented from the in-depth interviews conducted with 51 Ss emphasize the nature of Ss orientations to the future. Almost all Ss worked in blue-collar, nonfarm occupations. Most reported that they expected a good personal future regardless of their future in their current job and that self-change, self-control, and self-discipline

were second only to education as a means of improving one's life. These findings appeared to cross racial and sexual categories, and suggest that work is not a central emotional locus in Ss' lives, but is instrumental for achieving future goals. Implications for professional practice in education and counseling are noted. (24 ref)  
—L. Gorsey.

2036. Bourgeois, R. P. & Slivinski, L. W. **The interrater reliability of the Consolidated Fund In-Basket.** *Studies in Personnel Psychology*, 1974(Spr), Vol. 6(1), 47-51.—Investigated the interrater reliability of the Consolidated Fund In-Basket Test developed by the Educational Testing Service. The written responses were independently analyzed by 2 scorers on 9 quantitative scales. 38 French-speaking candidates at a middle management level taking part in a public administration program took the French version of the In-Basket Test. While reliability coefficients were generally considered to be high, significant interrater differences were noted in terms of percentile categories on the factors of Analyzing Problems and Relating Implications ( $p < .05$ ) and quantity of Action-Productivity ( $p < .01$ ). The lowest reliability coefficient was obtained for the Scorer's Rating of Overall Performance. (French abstract)—*Journal abstract*.

2037. Dole, Arthur A. (U Pennsylvania) **Aspirations of blacks and whites for their children.** *Vocational Guidance Quarterly*, 1973, Vol 22(1), 24-31.—Attempted to determine how the occupational aspirations of 143 black and white fathers, mothers, and guardians were related to the vocational activity of their children 6 mo after graduation from senior high school. Many of these parents, especially those with low aspirations, seemed to be seriously alienated from their children, perceived the children's career development inaccurately, and expected unreasonable control on the part of home and school. For other children, parents' occupational aspirations were potent in developing careers.—R. S. Albin.

2038. Eltzroth, Marjorie. (Massachusetts Executive Office of Human Services, Boston) **Vocational counseling for ghetto women with prostitution and domestic service backgrounds.** *Vocational Guidance Quarterly*, 1973, Vol 22(1), 32-38.—Examined the characteristics of 2 groups of black women over 25 yrs old who entered vocational training in a poverty agency during the fall of 1971. 20 women had a background of prostitution and 20 had a background of domestic work. The counseling problems encountered, the counseling approaches used, and the training outcomes are discussed. Only 4 of the prostitute group completed the program, but all of the domestic-service group did so. Recommendations are made to improve this result.—R. S. Albin.

2039. Flanagan, John C. (American Inst for Research, Palo Alto, CA) **The first 15 years of Project TALENT: Implications for career guidance.** *Vocational Guidance Quarterly*, 1973, Vol 22(1), 8-14.—Summarizes the major implications for career guidance of Project TALENT studies. *The Career Data Book*, which contains the principal findings from 5-yr follow-up studies of the project, is described.

2040. Huskey, Hyrum H. (Southern Illinois U) **Expressed needs and job satisfaction among military personnel.** *Vocational Guidance Quarterly*, 1973, Vol

22(1), 44-49.—Administered an author-constructed questionnaire to 100 persons in each of 4 rank-structure groupings of the US military population stationed in the area of West Berlin, Germany. The research question was whether the military worker, like his civilian counterpart, was tending to adopt self-actualization as an important part of the work ethic. Results show that job satisfaction was closely related to the individual's feeling that his self-growth needs were being met in his work. It is concluded that military as well as civilian workers are changing their work philosophy.—R. S. Albin.

2041. Kassem, Sami & St. John, D. F. **Technicians in research and development: Background, aspirations and motivational factors.** *Journal of Industrial & Organizational Psychology*, 1973(Spr), No 1, 23-35.—Summarizes, in a composite profile, questionnaires completed by 58 engineering and physical science technicians in 2 midwestern companies. Mean age of the respondents was 30, most were married, and formal education averaged 14 yrs. The majority classified the father's occupation as blue-collar. Positive motivating factors were the work itself, achievement, salary, responsibility, advancement, and recognition. Dissatisfiers were lack of advancement, lack of responsibility, salary, the work itself, lack of recognition, and lack of achievement. On the whole the technician perceives his role as that of a highly diversified skilled worker, not as a professional. 70% indicated the career objective of becoming an engineer or scientist or of entering an unrelated field. The present job is seen as a stepping stone to a professional career that is not yet within reach. It is suggested that management should recognize that technicians are a distinct group in terms of their needs, interests, and frame of reference. The job environment should be improved to be more conducive to growth and career development. Efficient use of skills and talents is also necessary to enrich the jobs of these careerists.—R. L. Sulzer.

2042. Keil, E. C. & Barbee, J. R. (Colorado State U, Research Utilization & Dissemination) **Behavior modification and training the disadvantaged job interviewee.** *Vocational Guidance Quarterly*, 1973, Vol 22(1), 50-56.—Administered a brief behavior change program to disadvantaged minority trainees from federally supported technical training programs to improve their employment interview behavior. 16 experimental Ss and 12 matched controls were compared. Each experimental S was videotaped during a pre- and posttraining simulated interview, and performance was evaluated by 4 judges for each tape. Items of the Job Interview Rating Scale on which the experimental Ss improved, and how these differed from changes in the controls, are discussed. Implications of the findings for interviewer attitudes are considered. (17 ref)—R. S. Albin.

2043. Lachar, David; Sparks, John C.; Larsen, Reed M. & Bisbee, Charles T. (Lafayette Clinic, Detroit, MI) **Psychometric prediction of behavioral criteria of adaptation for USAF basic trainees.** *Journal of Community Psychology*, 1974(Jul), Vol 2(3), 268-277.—Tested the ability of a specially constructed self-report personality inventory to predict emotional adjustment to military basic training. Ss were 14,804 consecutive new recruits. 2

predictive scales (emotional instability and drug-use predictions) were developed by item analysis of the Psychological Screening Inventory and a history, opinion, and interest form which were then combined into an adaptation index. This index labeled 12% of the Ss as high risk for problems of adaptation. Half of these high-risk Ss subsequently evidenced problems in adjustment during basic training. The issues of improved prediction over base rates and application of psychiatric screening to this population are discussed.—*Journal summary.*

2044. Leonard, Russell L. (American Inst for Research, Silver Spring, MD) **Relevance and reliability in the interview.** *Psychological Reports*, 1974(Jun), Vol 34(3, Pt 2), 1331-1334.—64 psychology undergraduate Ss served as interviewers in a simulated employment interview setting. Ss showed greater agreement on rating items that were relevant to the selection requirements for the job in question than on irrelevant items. This result is discussed in the context of improving training of interviewers and feedback in industrial settings.—*Journal abstract.*

2045. Schmidt, Frank L. & Hoffmann, Bernhard. (Michigan State U) **Empirical comparison of three methods of assessing utility of a selection device.** *Journal of Industrial & Organizational Psychology*, 1973(Spr), No 1, 13-22.—Compared the actual savings resulting from lowered worker turnover when using a weighted application blank for nurse's aides with the savings predicted from the Taylor-Russell, Brogden, and general utility models. Despite the widely different assumptions of the models about predictor and criterion scores and relations between variables, the 3 models appeared to be about equal in the accuracy of their savings estimates. The potential value of good selection practices was illustrated by the magnitude of savings. It is important, however, to remember that the validity and hence the utility of a particular selection technique usually declines over time. This is a result of changed labor market conditions, manpower needs, and personnel policies. Hence, periodic monitoring and revalidation when needed are required. (16 ref)—R. L. Sulzer.

2046. Seaton, Hal W. & Maola, Joseph. (U Akron) **Microteaching: A proposal for manpower development and training improvement.** *Journal of Employment Counseling*, 1974(Jun), Vol 11(2), 85-88.—Considers that microteaching through videotape equipment provides program coordinators with a means of evaluating the efficiency, effectiveness, and utility of the training center, and enhances trainee skills through immediate feedback. In addition, videotaped experiences offer increased knowledge to counselors, thus promoting vocational direction best suited to trainee needs.

2047. Smith, David G. & Mohlman, Robert N. (U Oakland) **Change in change agents: Effects of an employability institute.** *Journal of Employment Counseling*, 1974(Jun), Vol 11(2), 73-77.—Used a revised version of the Porter Scale of Counselor Attitudes to assess the interpersonal response patterns of 16 Nebraska Department of Labor employees who had completed training at the Nebraska Employability Development Institute. A significantly greater percentage of understanding responses (compared to national norms for a similar group) was interpreted as meeting intermediate criteria of training

program success. Comments are made regarding the further necessity for final program assessment using enrollee outcomes as successful criteria.—*Journal abstract.*

2048. Sterne, David M. (VA Hosp, Vancouver, WA) **The Kuder OIS and rankings of vocational preference.** *Educational & Psychological Measurement*, 1974(Spr), Vol 34(1), 63-68.—Compared Kuder Occupational Interest Survey (KOIS) scores of hospitalized veterans with their preferential rankings of the 77 KOIS occupations. Low intercorrelation was found, although test-retest reliabilities were .93 and .76 respectively. KOIS responses tended to resemble those of construction and skilled trades workers and differed from those of men employed in artistic, verbal-linguistic, and social service and psychologically oriented occupations. Professional occupations related to construction and skilled trades received the highest ranking.—*Journal abstract.*

2049. Trimmer, Harvey W. **Predictive validity of instructor ratings in a skill training setting.** *Journal of Employment Counseling*, 1974(Jun), Vol 11(2), 89-95.—Compared and contrasted predictive training ratings of 36 female trainees by their instructors, with first-line supervisory ratings of the same trainees in an employment setting. An ethnic subgroup analysis suggests possible differences in terms of range and variations of prediction.

2050. Varga, F. Louis . (California Dept of Human Resources Development, San Diego) **Employment counselors' perceptions of client needs.** *Journal of Employment Counseling*, 1974(Jun), Vol 11(2), 63-72.—Measured the differences in types of client needs perceived by various categories of counselors, the types of needs they attempted to help their clients gratify, and the needs that were viewed as gratified. 18 counselors and 697 clients (or their records) were used in the study. A 5-category need-classification guideline was used by 3 outside judges to categorize the list of needs compiled by the counselors. Differences in need categories were compared using a chi-square formula and Yates's correction for small frequencies. Significant findings and conclusions are presented.—*Journal abstract.*

### Job Performance & Satisfaction

2051. Alutto, Joseph A. & Acito, Franklin . (State U New York, Buffalo) **Decisional participation and sources of job satisfaction: A study of manufacturing personnel.** *Academy of Management Journal*, 1974(Mar), Vol 17(1), 160-167.—Tested J. A. Alutto and J. A. Belasco's 1972 model of decisional participation by administering measures of decision-making, satisfaction, attitudes toward company, commitment, job tension, interpersonal trust, and authoritarianism to 80 workers in a manufacturing firm. Data confirm the importance of decisional participation in job-related attitudes and behaviors. (17 ref)

2052. Bradburn, Norman M. (U. Chicago) **Is the quality of working life improving? How can you tell? And who wants to know?** *Studies in Personnel Psychology*, 1974(Spr), Vol. 6(1), 19-33.—Examines the concepts behind the variables involved in the changes in the quality of working life and the role of the US government in monitoring these changes. Focus is on the

relation of aspects of working life to a general theoretical framework for how people come to judge themselves as happy or unhappy, and on the role of social indicators in government policy formulation. (French abstract) —*Journal abstract.*

2053. Burke, Ronald J. (York U.) **Personnel job transfers: Some data and recommendations.** *Studies in Personnel Psychology*, 1974(Spr), Vol. 6(1), 35-45.—Notes that job transfers serve a number of purposes; lateral transfers benefit the organization while promotional transfers benefit both the organization and the employee. Descriptive data are presented from a questionnaire survey on the effects of transfer which was completed by 39 engineers who had been transferred at least once in the past 5 yrs and by their wives. Results show that job transfers presented a hardship. The high proportion of lateral transfers may be a source of discontentment, since these were associated with less satisfaction. (French abstract)—*Journal abstract.*

2054. Cascio, Wayne F. (U Rochester, Graduate School of Management) **Value orientation, organizational rewards, and job satisfaction.** New York, NY: U Rochester, Graduate School of Management, TR No 82, 1973. 87 p.—Surveyed 540 members of a nation-wide sales force to determine whether individuals who emphasize intrinsic (extrinsic) aspects of work can achieve the same level of overall job satisfaction if intrinsic (extrinsic) organizational rewards match their value orientation. High-intrinsic-low-extrinsic value orientation Ss were significantly more satisfied across all facets of their job than the high-extrinsic-low-intrinsic group. (49 ref)

2055. Cory, Charles H. **An evaluation of computerized tests as predictors of job performance in three navy ratings: 1. Development of the instruments.** *US Navy Personnel Research & Development Center Report*, 1974(Aug), No 75-2, 35 p.—Constructed 8 computerized tests to measure 5 personal attributes identified in previous research as being important for job performance. The experimental battery also contained 9 previously developed tests. The battery was administered to 385 naval trainees, and test results and interrelationships were analyzed in conjunction with operational written test and biographical variables. Results show that the computerized tests were particularly important for measuring sequential information processing, movement detection, and short-term memory skills. They offered no advantage over paper-and-pencil measures of perceptual speed, and findings relative to perceptual closure were ambiguous. It is concluded that computerized and paper-and-pencil tests of perceptual closure apparently measure different abilities. The 2 separate, short-term memory abilities found corresponded to faculties for high-associational and low-associational (rote) stimuli. (38 ref) —*Journal abstract.*

2056. Farley, Jennie . (Cornell U, New York State School of Industrial & Labor Relations) **Men, women, and work satisfaction on campus.** *Cornell Journal of Social Relations*, 1974(Spr), Vol 9(1), 17-33.—Surveyed the nearly 7,000 employees at Cornell University to get a general picture of the work force and to search for factors affecting the extent to which employees report themselves to be satisfied with their work. The work

force proved to be half male and half female, with the women overrepresented (69%) among those doing nonprofessional jobs and underrepresented (26%) among professional workers. As earlier studies have suggested, reported work satisfaction was linked with time on the job and job level. Women, who in general were at the university for a shorter time and in lower skilled jobs, did manifest less work satisfaction. Certain groups (e.g., faculty wives and student wives) appeared to be less happy than the other women. In addition, there was a trend suggesting that women in "men's fields" were (like men in "women's fields") likely to be less satisfied than their colleagues in fields traditional for their sex. Suggestions for utilizing the potential of women workers are included.—*Journal abstract.*

2057. Feldman, Harold & Feldman, Margaret. **The relationship between the family and occupational functioning in a sample of urban welfare women.** *Cornell Journal of Social Relations*, 1974(Spr), Vol 9(1), 35-52.—Conducted interviews with 1,325 women living in small towns and the areas around them. A  $2 \times 2 \times 2$  design was used with 2 employment groups (working outside the home for pay during the week of the interview vs unemployed), father present or father absent groups, and current welfare vs ex-welfare groups. Results are presented in terms of motivations to work, the degree of satisfaction obtained from working vs caring for the home, husband's role in employment decision making, family problems associated with working, possible changes in material consumption because of the wife's employment or unemployment, and special problems associated with welfare status. Findings indicate that role behavior and expectations in either the family or occupational systems were affected by obligations in the other and that there are strong social pressures for low income women to become employed to avoid becoming "parasites" on society; however, society also expects them to be primarily committed to their homes and families. Policy recommendations and implications are examined.—*L. Gorsey.*

2058. Förander, Nils. [Morale and discipline in the forces.] (Swed) *MPI B-Rapport*, 1974(Jun), No 101, 91 p.—Studied possible changes in the training of officers in the Swedish army which could result in greater efficiency and better morale and discipline. Discrepancies between the views of the Supreme Commander on morale and discipline and the characteristics of the actual situation were examined. Results indicate that the ability to receive information from subordinates should be improved and that the attitude held toward officers is the most important factor for satisfaction within the military environment. Generally, conscripted officers have better contacts with their subordinates than professional officers. It is recommended that professional officers' training should ultimately result in a combination of job performance and friendly contact and that certain rules of social communication be eliminated to facilitate this. Implications for training are noted.—*English summary.*

2059. Ivancevich, John M. & Donnelly, James H. (U Kentucky) **A study of role clarity and need for clarity for three occupational groups.** *Academy of Management Journal*, 1974(Mar), Vol 17(1), 28-36.—Investigated the need for role clarity (i.e., the extent to which required

information is communicated and understood) in 48 supervisors, 86 salesmen, and 127 operating (i.e., semiskilled) employees in an electronic manufacturing firm. All Ss completed (a) a 5-item role clarity index which assessed the extent of adequate role-relevant information and variations in the quality of information received; (b) a physical stress index; (c) a job satisfaction evaluation; and (d) a propensity to leave index. Salesmen correlations between all indices and role clarity were significant, except for physical stress, but none of the supervisor and operating employee correlations between job satisfaction and role clarity were significant. Significant relationships between role clarity and general job interest, job tension, and propensity to leave were found for all 3 occupational groups. Results also show that the extent of the need for clarity mediates the relationships between perceived clarity and job satisfaction.—*L. Gorsey.*

2060. Morgenstern, F. S.; Hodgson, R. J. & Law, J. (U London, Inst of Education, England) **Work efficiency and personality: A comparison of introverted and extraverted subjects exposed to conditions of distraction and distortion of stimulus in a learning task.** *Ergonomics*, 1974(Mar), Vol 17(2), 211-220.—Examined the relationship between personality characteristics and efficiency of work output, using as Ss 18 males chosen for high or low extraversion scores on the Eysenck Personality Inventory. Introverted Ss functioned less efficiently in the presence of distractions, while extraverted Ss showed actual improvement in the presence of distractions. Other differences in the mode of reaction of these 2 groups were seen in the range and duration of exploratory movements made to improve the artificially distorted character of the stimulus: the movements of the introverts were few and slow compared with the extravagant movements of the extraverts. It is suggested that this difference in response merits consideration in placement by personnel selection and may result in greater contentment at work and improved work efficiency.—*Journal abstract.*

2061. Ondrack, D. A. (U Toronto, Faculty of Management Studies, Ontario, Canada) **Defense mechanisms and the Herzberg theory: An alternate test.** *Academy of Management Journal*, 1974(Mar), Vol 17(1), 79-89.—A construct replication of F. Herzberg's findings, using the semistructured Occupational Values Scale to elicit projective responses about satisfying and dissatisfying job situations from 70 graduate business students, failed to yield the 2-factor pattern. Results from the use of this methodology support V. H. Vroom's ego-defense criticism of the recall methodology. (24 ref)

2062. Organ, Dennis W. & Greene, Charles N. (Indiana U, Graduate School of Business) **The perceived purposefulness of job behavior: Antecedents and consequences.** *Academy of Management Journal*, 1974(Mar), Vol 17(1), 69-78.—Investigated the relationships between work satisfaction, role ambiguity, locus of control, tenure, and perceived purposefulness of job behavior (PPB) in 94 senior scientists and engineers in a large electronics firm. Ss completed a perceived purposefulness of behavior index which evaluated how often they performed certain behaviors (e.g., setting goals for oneself) in connection with their jobs, Stogdill's Job Expectation Questionnaire, a role ambiguity scale by J.

R. Rizzo et al, and Rotter's Internal-External Control Scale. Zero-order correlational and correlational-causal analyses indicate that (a) increased tenure led to increasing perceived internal locus of control and reduced role ambiguity, (b) role ambiguity had an indirect effect on work satisfaction through its direct effect on PPB, and (c) internal locus of control was directly related to satisfaction as well as indirectly related to it by its effect on PPB. The possibility that PPB mediates the relationship between role clarity and job satisfaction is discussed. (21 ref)—*L. Gorsev.*

2063. Ronan, William W. & Latham, Gary P. (Georgia Inst. of Technology) **The reliability and validity of the critical incident technique: A closer look.** *Studies in Personnel Psychology*, 1974(Spr), Vol. 6(1), 53-64.—Evaluated the critical incident technique and its resulting behavioral indices with regard to 3 measures of reliability and 4 measures of validity. The behavior of interest was the job performance of small independent businessmen involved in pulpwood production. The interjudge reliability of the categorization process and the test-retest intra-O reliability based on responses to the critical behaviors were satisfactory. Low inter-O reliability was obtained. The content validity, construct validity, and relevance of the critical behaviors were judged satisfactory. Concurrent validity coefficients were significant at the .001 level. Results are discussed with reference to the problem of the observation of human behavior. (French abstract) (22 ref)—*Journal abstract.*

2064. Ruh, Robert A.; Johnson, Raymond G. & Sconrino, M. Peter. (Corning Glass Works, NY) **The Scanlon Plan: Participation in decision making and job attitudes.** *Journal of Industrial & Organizational Psychology*, 1973(Spr), No 1, 36-45.—Distributed questionnaires to employees in 15 separate Scanlon Plan units of 6 organizations. 2,488 were returned and showed a median educational level of 12th grade. Significant differences were noted between units in Scanlon Plan participation. Perceptions of the Scanlon Plan were positively related to job involvement, motivation; and identification with the organization. Results were consistent with earlier studies predicting that the Scanlon Plan should contribute to favorable employee attitudes since it provides opportunities for participation in decision making. Alternatively, the results might be interpreted as suggesting that favorable job attitudes influence perceptions of the Scanlon Plan. Contrary to earlier results, however, the relationships between participation in the plan and job attitudes were not much modified by occupational status or participation in the immediate job situation. (20 ref)—*R. L. Sulzer.*

2065. Sarveswara Rao, G. V. & Ganapathi Rao, V. (Small Industry Extension Training Inst, Hyderabad, India) **A study of factors contributing to satisfaction and importance of industrial personnel: A test of the two-factor theory.** *Indian Journal of Industrial Relations*, 1973(Oct), Vol 9(2), 233-262.—To investigate the 2-factor theory of job satisfaction, a job attitude questionnaire containing items related to satisfaction, importance of various aspects, and overall satisfaction was administered to 113 supervisors, 137 clerks, and 250 skilled workers. The questionnaire met the requirements of reliability and convergent and discriminant validity. The

job factors under satisfaction and importance scales were treated as independent variables and overall satisfaction was conceptualized as dependent variable. Assumptions underlying the 2-factor theory as well as the 2-factor plus importance theory were tested. Multivariate analyses revealed that motivators and hygienes were not mutually exclusive variables and their effects were not unidirectional. Both motivators and hygienes contributed to overall satisfaction, and both the variables were considered important in their relationship to the dependent variable. The 2-factor theory did not receive unequivocal support, and an attempt was made to explain the results with different theoretical frameworks. (2 p ref)—*Journal abstract.*

2066. Sarveswara Rao, G. V. & Ganguly, T. (Indian Inst of Science, Bangalore) **A study of perceived need satisfaction and importance of highly skilled and skilled personnel.** *Indian Journal of Industrial Relations*, 1971(Jan), Vol 6(3), 277-287.—Results of a survey of 82 highly skilled and 95 skilled personnel employed in an electrical equipment manufacturing unit indicate that occupational level was an important variable in determining employee's satisfaction. Both motivators and hygienes contributed to satisfaction and dissatisfaction of both occupational groups. It is concluded that the 2-factor-plus-importance theory is an oversimplification of facts and is unable to account for the dynamic nature of work motivation.—*Journal abstract.*

2067. Sarveswara Rao, G. V. (Indian Inst of Science, Bangalore) **Theoretical and empirical considerations of the two-factor theory of job satisfaction.** *Indian Journal of Industrial Relations*, 1972(Jan), Vol 7(3), 311-330.—The 2-factor theory of job satisfaction has received considerable attention in industrial psychology. The theory hypothesizes that satisfaction and dissatisfaction are separate and independent feelings. There are some variables called motivators which primarily contribute to satisfaction alone, and there are other variables called hygienes which primarily contribute to dissatisfaction alone. A review of the literature indicates that the implications of the theory have been found to be applicable to industrial relations, management training programs, and mental hygiene. Most of the studies designed to test the theory have not given rise to unequivocal results. A critical evaluation of the theory as a whole is presented. (6 p ref)—*Journal abstract.*

2068. Sarveswara Rao, G. V. (Small Industry Extension Training Inst, Hyderabad, India) **Determinants of job satisfaction of Indian engineers: A test of the two-factor theory.** *Indian Journal of Industrial Relations*, 1973(Apr), Vol 8(4), 605-619.—Conducted a study with 124 engineers to test the validity and the generality of the 2-factor theory of job satisfaction. A job attitude questionnaire consisting of 2 unipolar satisfaction and dissatisfaction scales and an overall satisfaction scale was administered to the Ss. Analysis revealed only partial support for the 2-factor theory. Satisfaction and dissatisfaction were found to be independent feelings, and motivators contributed to both satisfied and dissatisfied feelings. Motivators and hygienes were not mutually exclusive in the factor analytic sense. (2 P ref)—*Journal abstract.*

2069. Sarveswara Rao, G. V. (Small Industry Extension Training Inst, Hyderabad, India) **A study of weighting components of job satisfaction with importance ratings of industrial employees.** *Indian Journal of Industrial Relations*, 1974(Apr), Vol 9(4), 537-546.—Administered a job attitude questionnaire, consisting of items dealing with satisfaction and importance, to 113 supervisors, 137 clerks, and 250 skilled workers. An attempt was made to determine whether satisfaction multiplied by importance ratings would offer better results than the results obtained through satisfaction or importance dimensions considered separately. Analysis showed that there was no advantage in weighting components of job satisfaction with that of importance, inasmuch as the 2 dimensions were found to be unrelated. Findings indicate that unless and until the superiority of weighted combination of satisfaction with importance is clearly established, mere use of importance scale is not warranted. Job satisfaction scales of the Likert type are sufficient indicators of the importance of an attitude.—*Journal abstract*.

2070. Sarveswara Rao, G. V. (Small Industry Extension Training Inst, Hyderabad, India) **Convergent and discriminant validities between two measures of job satisfaction.** *Indian Journal of Industrial Relations*, 1973(Jan), Vol 8(3), 425-430.—Considers a type of construct validity termed convergent and discriminant validity by D. T. Campbell and D. W. Fiske (1959). Since this type of validity requires a minimum of 2 traits measured by 2 methods, 2 different ways of measuring job satisfaction were studied. A perceived need deficiency scale and a traditional bipolar job satisfaction scale were employed to determine whether there were any similarities and differences between the job factors of the respective scales. The 2 scales were administered to 247 industrial employees consisting of supervisors, clerks, and skilled workers. Intercorrelation analyses of various job factors revealed that the scales have reasonable validity. Findings have implications for behavioral scientists in industrial settings in that the concern for criterion-oriented or predictive validity may be replaced by an equal concern regarding what a scale means or signifies. (18 ref)—*Journal abstract*.

2071. Singhal, Sushila. (Jawaharlal Nehru U, Zakir Husain Ctr for Educational Studies, School of Social Sciences, India) **Perceptual gap in the need-gratification of industrial employees.** *Indian Journal of Social Work*, 1974(Jan), Vol 34(4), 351-358.—Used Maslow's need-hierarchy model to assess perceptual differences in need-gratification and need importance. Ss were 50 workers who participated in the organization, 50 who did not, and 28 foremen and 17 assistant foremen in different plants. Those who participated placed physiological needs above autonomy; the reverse was true for those who did not participate. Foremen and assistant foremen placed autonomy over self-actualization and employees at the 3 levels of organization had significantly different physiological needs. Gratification of higher-order needs remained important to all employees after their lower-order needs were marginally satisfied. Difference in income led to variations of perceptual gap in the gratification of physiological needs but not of autonomy

and self-actualization. The implications of these findings are discussed.—*I. W. Kidorf*.

2072. Tuttle, Thomas C. & Hazel, Joe T. **Review and implications of job satisfaction and work motivation for Air Force research.** *US AFHRL Technical Report*, 1974(Jan), No 73-56, 76 p.—Reviews certain major theories of work motivation, particularly as related to job satisfaction, derives implications for an Air Force job satisfaction research program, and provides a comprehensive 12-page bibliography of satisfaction-retention studies. The theoretical positions considered were Two-Factor, Equity, Instrumentality-Expectancy, Cornell Studies of Satisfaction, and Need-Fulfillment. Conclusions relevant to Air Force job satisfaction-retention research are derived, a general model of satisfaction-tenure for further inquiry is developed, and recommendations regarding a long-range systematic research program are offered. (139 ref)—*Journal abstract*.

2073. Walton, Richard E. (Harvard U., Graduate School of Business Administration) **QWL indicators: Prospects and problems.** *Studies in Personnel Psychology*, 1974(Spr), Vol. 6(1), 7-18.—Suggests that employees in North America are becoming less satisfied with the quality of their working lives. This quality of working life can be analyzed on 3 levels: organizational conditions, employee attitudes, and behavioral systems. Additional social dynamics complicate the role of social indicators. A step model is presented for improving the quality of working life. (French abstract)—*Journal abstract*.

2074. Williams, William E. & Seiler, Dale A. **Supervisor and subordinate participation in the development of behaviorally anchored rating scales.** *Journal of Industrial & Organizational Psychology*, 1973(Spr), No 1, 1-12.—Describes current trends in performance appraisal. Instead of using instruments developed exclusively by psychologists, the tendency is for users of the rating scales to participate in translating specific work performances and accomplishments into job performance dimensions and general descriptors that will be understood by users and accepted as a fair method of setting salaries. These users are the employees themselves, who establish their own work goals, and the superiors who will assign ratings. Application of this procedure to an engineering organization did not appear to make it more difficult to reach an agreement. It is suggested that the experience of participation in criterion development should also enhance subsequent acceptance of the scales.—*R. L. Sulzer*.

#### Management & Leadership

2075. Frost, Carl F.; Wakeley, John H. & Ruh, Robert A. (Michigan State U) **The Scanlon Plan for organization development: Identity, participation, and equity.** East Lansing, MI: Michigan State U Press, 1974. xii, 197 p. \$10.—Discusses 2 main elements of the Scanlon Plan: a system for coordinating labor and management in pursuing, developing, refining, and implementing ideas that make work more satisfying and productive; and a system for sharing the economic rewards of improved productivity. The philosophy of management of the Scanlon Plan insists on superior performances toward the organization's objectives and rewards individual and collective discipline and responsibility. (5 p ref)

2076. Green, Thad B. & Ray, Dennis F. (Mississippi State U) **Academy of management proceedings: Thirty-third annual meeting, Boston, Massachusetts, August 19-22, 1973.** Boston, MA: Academy of Management, 1974. viii, 631 p.—Discusses current issues in national and international management; business policy and planning; managerial consultation, education, and development; manpower management; and organizational theory, development, and behavior.

2077. Hay, Robert & Gray, Ed. (U Arkansas) **Social responsibilities of business management.** *Academy of Management Journal*, 1974(Mar), Vol 17(1), 135-143.—Argues that value systems and styles of social responsibility of managers have gone through 3 historical phases—Phase 1, the profit maximizer style; Phase 2, the trusteeship style; and Phase 3, the quality-of-life style. It is suggested that Phase-3 values will become more accepted by business managers of the future.

2078. Larson, Lars L. & Rowland, Kendrith M. (Southern Illinois U) **Leadership style and cognitive complexity.** *Academy of Management Journal*, 1974(Mar), Vol 17(1), 37-45.—Studied the relationship between least preferred coworker (LPC) scores and cognitive complexity in 24 male middle- and upper-level managers (age range = 31-50 yrs), 30 male civil service engineers (age range = 24-55 yrs), 79 male undergraduates, and 44 male graduate business students. Cognitive complexity was measured using T. R. Mitchell's modification of W. A. Scott's measure of cognitive complexity—simplicity and by Bieri's REP Test. Results do not support the hypothesis that LPC scores are positively related to measures of cognitive complexity in the area of interpersonal relations. Age and experience had no effects on this relationship. (21 ref)—L. Gorsey.

2079. Misumi, Jyuji & Ishida, Umeo. (Kyushu U., Fukuoka, Japan) **[An experimental study of "complementary effects" of leadership styles at two step supervisory levels.]** (Japn) *Japanese Journal of Experimental Social Psychology*, 1972(Mar), Vol. 11(2), 148-158.—Studied the complementary effects of different leadership types between 2 organizational levels upon job satisfaction and productivity of the group. The leadership types were P (strongly performance-oriented), M (strongly maintenance-oriented), PM (strongly oriented toward both performance and maintenance), and pm (weakly oriented toward both). 63 male workers (average age 22) at a post office were randomly formed into 10 groups of 3 members each, to which different combinations of leadership types were assigned between 2 levels. 10 graduate students played the role of 1st-line leaders and 3 associate professors played the role of 2nd-line leaders. Results indicate that "complementary conditions," which included P and M between 2 levels together, yielded significantly higher productivity than "overlapping conditions" (P-P or M-M) or the pm condition.—*Journal abstract.*

### Organizational Structure & Climate

2080. Gadbois, C. **[Psychological analysis of organizations: Climate and its dimensions.]** (Fren) *Année Psychologique*, 1974, Vol 74(1), 269-293.—Examines organizational climate, the environment in which the working individual exists, based on subject-environment

interaction as the explanation of behavior. Topics considered include the evolution of behavior analysis in organizations, personality and individual behavior, the climate of large and small groups, and values and attitudes.

2081. Kiev, Ari. (Cornell U, Medical School, New York) **A strategy for handling executive stress.** Chicago, IL: Nelson-Hall, 1974. 178 p. \$7.95.—Describes sources of tension and anxiety in contemporary corporate life and prescribes techniques for reducing and managing conflict. Major topics include (a) characteristics of psychological stress and self-defeating behavior; (b) procedures for integrating corporate and personal objectives, based primarily on the idea of self-actualization and crisis intervention models; and (c) recommendations for industry for assessing personnel strength and bettering communication.

### Human Factors Engineering & Safety

2082. Bergström, Sten S. & Franzén, Ove. (Uppsala U, Psychological Inst, Sweden) **[Scanning and visual contrast.]** (Swed) *MPI A-Rapport*, 1974(Apr), No 23, 32 p.—Systematically reviewed conditions known to influence contrast thresholds in human visual scanning with particular reference to military applications of detection and recognition of aircraft. Gaps in the literature are identified, especially the topics of moving signals and heterogeneous backgrounds. Research is proposed to explore contrast thresholds under conditions resembling practical scanning situations. Signal detection will be studied as a function of luminance levels and varying backgrounds. (54 ref)—R. J. Simeonsson.

2083. Brigham, F. R. (U of Technology, Loughborough, England) **A critical note on the application of analysis of variance techniques in ergonomics research.** *Ergonomics*, 1974(Mar), Vol 17(2), 259-265.—A survey made of the statistical techniques used in 108 papers appearing in *Ergonomics* between 1969 and 1971 showed that analysis of variance had been misapplied in many cases, sometimes with potentially serious consequences. The major criticisms concern the use of inappropriate error terms, the inadequate consideration of some of the assumptions involved in repeated measures and other designs, and the omission of a posteriori tests.

2084. Chapanis, A. (Johns Hopkins U) **National and cultural variables in ergonomics.** *Ergonomics*, 1974(Mar), Vol 17(2), 153-175.—Posits that ergonomics has been largely an American and Western European discipline and that present-day ergonomics is not robust enough to cope with the large and important differences found among the people of the earth. These differences are discussed under 5 major headings: anthropometry, language, physiology, psychology, and customs and practices. In each case, the differences are so great that they require substantial modification in commonly accepted ergonomics principles and practices. In some cases, the technical design problems involved in adapting equipment to non-Western societies have required the development of new ergonomics principles. It is stressed that failure to take account of national and cultural variables may nullify the gains reasonably expected to follow from the application of ergonomics in many areas of the world. (24 ref)—*Journal abstract.*

2085. **Chapanis, Alphonse**. (Johns Hopkins U) **Human engineering environments for the aged**. *Applied Ergonomics*, 1974(Jun), Vol 5(2), 72-80.—Human engineering, which has until recently been primarily concerned with military and aerospace systems, is now focusing on broader societal problems. Many human engineering principles can be generalized to cover the design of environmental features for the aged, such as visual displays, work places, tools and appliances, and stairways and ramps.

2086. **Evans, Leonard & Rothery, Richard**. (General Motors Research Lab, Warren, MI) **Detection of the sign of relative motion when following a vehicle**. *Human Factors*, 1974(Apr), Vol 16(2), 161-173.—Investigated the ability to detect the sign of relative motion in the driving situation. 12 male passengers in a specially instrumented vehicle were given controlled looks, normally of 4-sec duration, of a lead car. It was the S's task to estimate whether the 2 cars had come closer or moved further apart during the exposure. The comparative ability of 9 stimulus functions to predict the detection of the sign of relative motion was examined. The most consistent results were obtained when it was assumed that the response was to either the average value of relative speed during the exposure divided by spacing, or to the spacing change divided by spacing. One of the most consistent effects observed was a response bias in favor of indicating that the cars had come closer when they had not. Results indicate considerable sensitivity to the sign of relative motion. (18 ref)—*Journal abstract*.

2087. **Ferguson, D. A.; Major, G. & Keldoulis, T.** (U Sidney, School of Public Health & Tropical Medicine, NSW, Australia) **Vision at work: Visual defect and the visual demand of tasks**. *Applied Ergonomics*, 1974(Jun), Vol 5(2), 84-93.—Several studies of visual tasks in a large communications undertaking have revealed much defect of vision and many sources of visual fatigue and inefficiency. The nature of visual fatigue is described, and a program to facilitate visual tasks is outlined. (43 ref)

2088. **Gardner, James A. & Soliday, Stanley M.** (North Carolina State U) **Human factors in digital telecommunications**. *Human Factors*, 1974(Apr), Vol 16(2), 146-153.—Describes an experimental methodology which relates human visual performance to electronic digital system design parameters. These relationships are used to show how to specify optimal encoder design parameters. To illustrate this experimental procedure, tradeoffs were determined for a digitally encoded TV system. These relationships were determined by measuring 12 university students' minimum perceptible acuities for various length lines and spatial orientations. Visual performance was determined for points along 4 noise-bandwidth curves representing different information capacities and system costs. Optimum system performance was achieved by maximizing the sampling frequency (bandwidth) of the encoder.—*Journal abstract*.

2089. **Huddleston, H. F.** (Royal Aircraft Establishment, Farnborough, England) **A comparison of two 7 x 9 matrix alphanumeric designs for TV display**. *Applied Ergonomics*, 1974(Jun), Vol 5(2), 81-83.—12 technical workers and 16 pilots read the individual characters of 2 alphanumeric designs from a TV screen

arranged to appear briefly at a fixed position and contrast level. The comparisons showed that the Royal Aircraft Establishment design caused fewer errors than a comparable US design for the conditions of the experiments. (17 ref)

2090. **Kennedy, T. C.** (Southend-on-Sea Hosp, Essex, England) **The design of interactive procedures for man-machine communication**. *International Journal of Man-Machine Studies*, 1974(May), Vol 6(3), 309-334.—Examines the process of normal communication between individuals to determine principles which may be applied to the design of a man-machine communication language. Practical experience in the design of data entry procedures is discussed, and it is suggested that the system, as perceived by the user, should be made simple and natural in its structure, even though this may involve extensive programming to match efficient internal data structures to the required external model. A set of ground rules for the design of a "well-behaved" system is proposed. (22 ref)

2091. **Kraft, Conrad L. & Anderson, Charles D.** (Boeing Aerospace Co, Seattle, WA) **Prediction of target acquisition performance of aerial observers and photointerpreters with and without stereoscopic aids**. *USAF AMRL Technical Report*, 1973(Dec), No 73-36, 98 p.—Screened 48 adults for visual acuity, stereopsis, phorias, and color perception and investigated the effects of image chromaticity and display stereoscopy. Ss' stereoscopic skill in the Sonne viewer was measured with achromatic and chromatic transparencies of regular and irregular terrain versions of the Critical Limen Stereo Test displayed statically and dynamically. Stereoscopic performance was better with the achromatic tests over the chromatic tests, irregular background over the regular background tests, and stationary display over dynamic display. All main effects were statistically significant, and O performance correlated across tests. Chromostereopsis appeared to be a factor contributing to large individual differences, and its measurement was necessary in maximizing predictions with chromatic imagery. Prediction of target acquisition performance on moving strip imagery displayed stereoscopically was good. The 4 combinations of main conditions, and achromatic and chromatic imagery displayed nonstereoscopically or stereoscopically, resulted in similar target acquisition performance.—*Journal abstract*.

2092. **Long, James L.** (US Naval Personnel Research & Development Lab, Washington, DC) **A stereo tape recorder technique for observational data**. *Human Factors*, 1974(Apr), Vol 16(2), 154-160.—Describes a technique for the collection and analysis of observational data using a specially configured stereo tape recorder and a dual-channel amplifier-recorder for a paper printout. The method has been used to compare trainer operations to real-life operations, and in field studies to evaluate console designs, activity rates, and percentage of time devoted to various activities.

2093. **Mills, Robert G. & Hatfield, Shirley A.** (Wright Patterson Air Force Base, Aerospace Medical Research Lab, OH) **Sequential task performance: Task module relationships, reliabilities, and times**. *Human Factors*, 1974(Apr), Vol 16(2), 117-128.—Developed a methodology and conducted an experiment to examine some of

the assumptions and combinatorial rules employed in applying human performance reliability (HPR) and task time data to the quantification of human performance. 5 paid university students performed a variety of tasks designed to provide empirical estimates of HPR and task time and to permit examination of the effects of combining tasks. Results indicate that (a) the normality assumption for distribution of task time was inappropriate, (b) the rules for combining task times were satisfactory if the underlying distribution of task times was known, (c) HPR was affected severely by combining tasks, and (d) any model for estimating HPR will require parameters to account for task combining and difficulty. —*Journal abstract.*

2094. Moore, T. G. (Loughborough U of Technology, Human Sciences & Advanced Technology Research Group, England) **Tactile and kinaesthetic aspects of push-buttons.** *Applied Ergonomics*, 1974(Jun), Vol 5(2), 66-71.—Describes the tactile and kinesthetic senses, explaining their importance for button design and layout, especially in situations where visual identification of buttons is not possible. An experiment is reported whereby push-button shapes were tested for tactile discriminability and allocated to given control functions.

2095. Pollack, Irwin. (U Michigan, Mental Health Research Inst) **Detection of changes in spatial position: IV. Multiple display fields, display aiding, and interference.** *Human Factors*, 1974(Apr), Vol 16(2), 93-116.—Conducted 3 series of studies with 12-15 operators in each to examine the detection of changes in spatial position for random-dot visual patterns in sequences of 2-16 successive display fields. Results show that operators integrated displacement information across successive display fields; detection was nearly invariant with a fixed total displacement over successive display fields, whether the status of a particular dot was queried or whether the observer indicated only whether any dot in the field has been displaced. Display aiding, represented by a trail of displacements, was extremely effective; strikingly large performance changes—from near chance to near perfect—were observed as a function of the length of the trail, especially at long intervals between successive displacements. The rate of trail fading proved to be a relatively insensitive variable. 3 forms of visual interference were distinguished: clutter, or stationary noise; jitter, or stationary noise modified by a random walk; and random noise. Random noise was substantially more interfering than clutter. Implications for the design of displays are briefly discussed. (17 ref)—*Journal abstract.*

2096. Signori, Edro I. & Bowman, Roland G. (U British Columbia, Vancouver, Canada) **On the study of personality factors in research on driving behavior.** *Perceptual & Motor Skills*, 1974(Jun), Vol 38(3, Pt 2), 1067-1076.—Considers that the involvement of personality factors in traffic accidents is supported by findings from psychiatric studies which focus on psychopathology, psychopathy, stress, alcoholism, and accident-proneness and from other studies which make use of psychological testing devices to measure components of personality. Further progress in clarifying the relationship between personality and traffic accidents may be achieved through the use of more appropriate validation

criteria and more inclusive stylistic conceptions of personality. Guidelines for further research are presented, and studies of field independence-dependence and its role in driving behavior and the relation between certain Jungian functions and driving are suggested. (47 ref)—*Journal abstract.*

2097. Singleton, W. T. (U Aston) **Man-machine systems.** Harmondsworth, England: Penguin, 1974. 178 p. \$2.50.—Examines the concepts and problems involved in man-machine interactions, separates functions from the means of achieving them, and stresses the importance of structuring the design process itself. Techniques of analyzing job and task and skill and error are discussed, as well as job description, selection, and training. (5 p ref)

2098. Slater, S. W. & White, M. J. (Victoria U Wellington, New Zealand) **Sodium lighting and mercury lighting on the road.** Wellington, New Zealand: Victoria U, Dept of Psychology, 1972. 18 p.—Comparisons of signal detectability on the road showed higher detection rates for the sodium-light than for the mercury-light condition. It is recommended that similar research be done under laboratory conditions and that further study be undertaken of acuities relying on color contrast.

2099. Soliday, Stanley M. & Gardner, James A. (North Carolina State U) **Picture quality judgments in a digital television system.** *Human Factors*, 1974(Apr), Vol 16(2), 139-145.—Notes that digital communication systems distort their signals as a consequence of the digitization process and that the distortions are related to the code length and sampling frequency of the system. The present study assessed viewers' responses to these variables by using simulated digital TV. 24 male undergraduates with normal vision rated the quality of pictures distorted by several combinations of the variables. A response surface generated from the ratings showed that the ratings were affected by both variables, but most profoundly by code length. Interpretation of the surface's contours from the perspective of system costs revealed that costs should be considered solely from the standpoint of code length.—*Journal abstract.*

2100. Walker, James T. (U Missouri, St Louis) **Lythgoe's visual stereophenomenon in the natural environment: A possible factor in air and highway accidents.** *Human Factors*, 1974(Apr), Vol 16(2), 134-138.—Discusses R. J. Lythgoe's 1938 discovery that the path of a horizontally moving object, when viewed binocularly, appears distorted in depth if a light shines in only one of the observer's eyes. The image in the lighted eye has a shorter visual latency period than the image in the other eye, and this temporal difference between image latencies translates into an apparent spatial difference between image positions—binocular disparity—which results in the apparent depth displacement of the moving object. It is suggested that, in the natural visual environment, one eye can be lighted by the sun while the other is shaded by the nose, and thus distortions may be produced in the apparent paths of airplanes, or of traffic moving on the ground. It is noted that the roles that such distortions may play in some air and highway accidents have not been considered previously.—*Journal abstract.*

2101. Weltman, Gershon et al . (Perceptronics, Woodland Hills, CA) **Experimental study of man-machine interaction in adaptive computer aided control.** Woodland Hills, CA: Perceptronics, 1974. v, 52 p. —Presents the theoretical background and results of an experiment with 16 military computer operators which

investigated human factors criteria for adaptive computer aiding and a rationale for shared decision and control. A program was developed and tested which provides on-line estimation of operator utilities for his own and machine control. (16 ref)

# BRIEF SUBJECT INDEX

Entries in the Brief Subject Index are derived from a 4,000-term *Thesaurus of Psychological Terms*. Only those terms representing subject matter content covered in this monthly issue are listed. A thesaurus term missing from the listing indicates that no material of major relevance to the concept is included in the issue. Records are indexed at the level of specificity contained in each document. Each index entry also refers the reader to broader generic concepts as well as to more specific concepts related to each term. Thus, a reader interested in articles concerning childhood psychosis may find additional relevant information under "psychosis" or "early infantile autism."

# BRIEF SUBJECT INDEX

**Communications Media** [See Mass Media, Motion Pictures, Motion Pictures (Entertainment), Newspapers, Printed Communications Media, Radio, Telecommunications Media, Telephone Systems, Television, Television Advertising, Videotapes]  
**Communism** 5  
**Communities** [See also Kibbutz] 887, 995  
**Community Colleges** [See Colleges]  
**Community Facilities** [See also Community Mental Health Centers, Housing, Public Transportation, Suicide Prevention Centers] 1840  
**Community Mental Health Centers** 1253, 1788, 1789, 1793, 1795, 1796, 1800, 1804, 1815  
**Community Mental Health Training** [See also Mental Health Inservice Training] 1253, 1273, 1305  
**Community Psychiatry** 1798, 1800  
**Community Psychology** 1802, 1813  
**Community Services** [See also Crisis Intervention Services, Hot Line Services, Public Health Services] 1788, 1790, 1792, 1797, 1812  
**Comparative Psychology** 214, 609, 680, 731, 790  
**Compatibility (Interpersonal)** [See Interpersonal Compatibility]  
**Competition** 2034  
**Complexity (Cognitive)** [See Cognitive Complexity]  
**Complexity (Stimulus)** [See Stimulus Complexity]  
**Complexity (Task)** [See Task Complexity]  
**Compliance** 1615  
**Comprehension** [See also Listening Comprehension, Reading Comprehension, Sentence Comprehension] 848  
**Compressed Speech** 1150, 1574  
**Compulsions** 1579  
**Compulsive Neurosis** [See Obsessive Compulsive Neurosis]  
**Computer Applications** [See also Computer Assisted Diagnosis, Computer Simulation] 60, 64, 156, 263, 433, 1134, 1597, 2055  
**Computer Assisted Diagnosis** 1442  
**Computer Programming Languages** 17  
**Computer Programs** [See Computer Software]  
**Computer Simulation** 1912, 2034  
**Computer Software** 43, 61, 68, 70, 72, 73, 75, 76, 83, 88, 90, 101, 109, 110, 112, 114, 1442, 2090  
**Computers** [See Digital Computers]  
**Concentration Camps** 1183  
**Concept (Self)** [See Self Concept]  
**Concept Formation** 2, 297, 345, 853, 886, 889, 1336  
**Concept Learning** [See also Reversal Shift Learning] 303, 311, 318, 323, 331, 865, 871, 1179, 1927, 2011  
**Concepts** 290  
**Conceptual Imagery** 163, 1151  
**Conceptualization** [See Concept Formation]  
**Conditioned Emotional Responses** 344, 587, 634, 695, 705  
**Conditioned Reflex** [See Conditioned Responses]  
**Conditioned Responses** [See also Conditioned Emotional Responses, Conditioned Suppression] 640, 711, 745

**Conditioned Stimulus** 678, 701, 702  
**Conditioned Suppression** 344, 634, 678, 696, 746  
**Conditioning** [See also Avoidance Conditioning, Classical Conditioning, Conditioned Emotional Responses, Conditioned Responses, Conditioned Stimulus, Conditioned Suppression, Escape Conditioning, Operant Conditioning] 527, 731, 820, 826, 1093  
**Conditioning (Avoidance)** [See Avoidance Conditioning]  
**Conditioning (Classical)** [See Classical Conditioning]  
**Conditioning (Escape)** [See Escape Conditioning]  
**Conditioning (Operant)** [See Operant Conditioning]  
**Conditioning (Verbal)** [See Verbal Learning]  
**Cones (Eye)** 223  
**Conference Proceedings** 1027, 1786  
**Conflict** [See also Violence, War] 1037, 1049, 1050, 1399  
**Conflicts (Role)** [See Role Conflicts]  
**Conformity (Personality)** 1077, 1403, 1459, 1505  
**Congenital Disorders** [See Hermaphroditism]  
**Conscience** 1416  
**Consciousness Disturbances** [See also Autohypnosis, Delirium, Hypnosis, Insomnia] 1340  
**Consciousness States** [See also Attention, Awareness, Divided Attention, Monitoring, Selective Attention, Vigilance, Wakefulness] 192, 283, 284, 295, 1177  
**Conservation (Concept)** 842, 862, 873, 876, 877  
**Conservatism** 292, 944, 1232  
**Conservatism (Political)** [See Political Conservatism]  
**Consonants** 183, 1116, 1142  
**Consultation (Professional)** [See Professional Consultation]  
**Consumer Attitudes** 1008, 1124, 1126, 1136, 1180, 2013, 2024, 2028, 2033  
**Consumer Behavior** 1024, 1126, 1136, 1138, 1180, 2014, 2017, 2018, 2021, 2024, 2026  
**Consumer Research** 96, 1008, 1160, 2018, 2021  
**Content Analysis (Test)** 1231  
**Contextual Associations** 357, 374, 380, 385, 410, 412, 1147, 1498  
**Contiguity (Cognitive)** [See Cognitive Contiguity]  
**Contingency Management** [See also Token Economy Programs] 346, 1065, 1877, 1901, 1933, 1981  
**Continuing Education** [See Higher Education]  
**Continuous Reinforcement** [See Reinforcement Schedules]  
**Contour** [See Form And Shape Perception]  
**Contraception** [See Birth Control]  
**Contraceptive Methods** [See Birth Control]  
**Contribution (Professional)** [See Professional Contribution]  
**Control (Locus of)** [See Internal External Locus of Control]  
**Control (Stimulus)** [See Stimulus Control]

**Convergent Thinking** [See Inductive Deductive Reasoning]  
**Conversation** 1079  
**Conversion Neurosis** [See Hysterical Vision Disturbances]  
**Convulsions** 555  
**Cooperation** 1062, 1092, 1834, 1932, 2002  
**Coordination (Motor)** [See Motor Coordination]  
**Coordination (Perceptual Motor)** [See Perceptual Motor Coordination]  
**Coping Behavior** 428, 924, 1183, 1197, 1420, 1582, 1715  
**Copulation** [See Sexual Intercourse (Human)]  
**Copulation (Animal)** [See Animal Mating Behavior]  
**Coronary Disorders** [See Cardiovascular Disorders]  
**Coronary Vessels** [See Arteries (Anatomy)]  
**Corpus Callosum** 526, 1557  
**Correctional Institutions** [See also Prisons] 1455, 1951  
**Correlation (Statistical)** [See Statistical Correlation]  
**Cortex (Cerebral)** [See Cerebral Cortex]  
**Cortex (Visual)** [See Visual Cortex]  
**Cortical Evoked Potentials** 537  
**Corticosteroids** [See Corticosterone, Hydrocortisone, Prednisolone]  
**Corticosterone** 494  
**Cortisol** [See Hydrocortisone]  
**Costs And Cost Analysis** 1805, 2033  
**Counseling (Group)** [See Group Counseling]  
**Counseling** [See Also Related Terms] 1249, 1250, 1254, 1263, 1294, 1310, 1633, 1809, 1810  
**Counselor Attitudes** 1304, 1986, 2047, 2050  
**Counselor Characteristics** 1240, 1291, 1299, 1810, 1816  
**Counselor Client Interaction** [See Psychotherapeutic Processes]  
**Counselor Education** 1235, 1238, 1240, 1244, 1246, 1252, 1257, 1259, 1260, 1264, 1269, 1272, 1275, 1276, 1279, 1283, 1285, 1287, 1290, 1291, 1294, 1299, 1302, 1303, 1306, 1307, 1633, 2047  
**Counselor Effectiveness** [See Counselor Characteristics]  
**Counselor Personality** [See Counselor Characteristics]  
**Counselor Role** 1249, 1279, 1283, 1285, 1298, 1310, 1658, 1814, 2007  
**Counselor Trainees** 1299

# BRIEF SUBJECT INDEX

- Syllables, Syntax, Verbs, Vowels, Words (Phonetic Units) 375, 1117, 1929  
 Listening [See Auditory Perception]  
 Listening Comprehension 860, 1574  
 Literature [See also Poetry, Prose] 999, 1115, 1120, 1123, 1128, 1131, 1137, 1149, 1152, 1156, 1185, 1302  
 Literature Review 27, 160, 215, 282, 285, 373, 484, 555, 597, 633, 686, 710, 838, 874, 927, 976, 1007, 1014, 1022, 1029, 1061, 1150, 1337, 1367, 1448, 1472, 1514, 1545, 1551, 1573, 1589, 1615, 1683, 1773, 1784, 1848, 1883, 2067, 2072, 2082  
 Lithium 632, 1661, 1692  
 Lithium Carbonate 1669, 1674  
 Lizards 694  
 Local Anesthetics [See Cocaine, Lidocaine, Novocaine]  
 Localization (Perceptual) [See Perceptual Localization]  
 Localization (Sound) [See Auditory Localization]  
 Locus of Control [See Internal External Locus of Control]  
 Logic (Philosophy) 1191  
 Logical Thinking 347, 842  
 Loneliness 1069, 1617  
 Long Term Memory 371, 393, 398, 411, 412, 680, 1578  
 Longevity [See Aged, Physiological Aging]  
 Longitudinal Studies 840, 845, 919, 948, 1018, 1320, 1718, 1808, 1858, 2024  
 Loudness 1592  
 Loudness Discrimination 174, 175, 179  
 Loudness Perception [See also Loudness Discrimination] 184  
 Loudness Threshold [See Auditory Thresholds]  
 Love 1048  
 Lower Class 246, 967  
 Lower Class Attitudes 1171  
 Lower Income Level 1171, 1212  
 LSD (Drug) [See Lysergic Acid Diethylamide]  
 Luminance [See Illumination]  
 Luminance Threshold [See Brightness Perception, Visual Thresholds]  
 Lunar Synodic Cycle 1449  
 Lung 943  
 Lying [See Deception]  
 Lysergic Acid Diethylamide 1624, 1695  
 Machiavellianism 1078, 1100, 1232  
 Magical Thinking 1109, 1925  
 Maids [See Domestic Service Personnel]  
 Major Tranquilizers [See Neuroleptic Drugs]  
 Maladjustment (Emotional) [See Emotional Adjustment]  
 Maladjustment (Social) [See Social Adjustment]  
 Male Animals 494, 564, 772  
 Male Castration 521, 524, 529  
 Male Delinquents 1433, 1457, 1861, 1951, 1967  
 Males (Human) [See Human Males]  
 Malnutrition [See Nutritional Deficiencies]  
 Mammals [See also Bats, Beavers, Cats, Dogs, Dolphins, Gerbils, Gorillas, Guinea Pigs, Hamsters, Horses, Lemurs, Mice, Monkeys, Primates (Nonhuman), Rabbits, Rats, Rodents, Seals (Animal), Squirrels] 496, 686  
 Mammary Bodies (Hypothalamic) [See Hypothalamus]  
 Man Machine Systems 2097  
 Man Machine Systems Design 2087, 2088, 2089, 2090, 2094, 2101  
 Management Decision Making 2051, 2064  
 Management Personnel [See also Middle Level Managers, Top Level Managers] 2059, 2063, 2077  
 Management Planning 2075  
 Management Training 2036  
 Manic Depression 1320, 1341, 1669, 1850, 1851  
 Manic Depressive Psychosis 1332, 1374, 1419  
 Manpower [See Personnel]  
 Manufacturing [See Business]  
 Marihuana 611, 615, 1515  
 Marihuana Usage 403, 630, 991, 992, 1007, 1089  
 Marijuana [See Marihuana]  
 Marital Adjustment [See Marital Relations]  
 Marital Conflict 1386, 1758  
 Marital Problems [See Marital Relations]  
 Marital Relations [See also Marital Conflict] 967, 974, 1004, 1386  
 Marital Status 922, 1862  
 Marketing 1124, 1136, 1160, 2026  
 Markov Chains 69  
 Marriage [See also Endogamous Marriage, Exogamous Marriage] 954, 1004, 1221, 1477, 1758  
 Marriage Attitudes 1004  
 Marriage Counseling 974, 1758, 1786  
 Marriage Therapy [See Marriage Counseling]  
 Married Couples [See Spouses]  
 Masking [See Auditory Masking, Visual Masking]  
 Masochism 1331  
 Masochistic Personality 1741  
 Mass Media [See also Newspapers, Radio, Telephone Systems, Television, Television Advertising] 1121  
 Massed Practice 706, 1497  
 Maternal Behavior (Animal) [See Animal Maternal Behavior]  
 Maternal Behavior (Human) [See Mother Child Relations]  
 Maternal Deprivation [See Animal Maternal Behavior, Mother Child Relations]  
 Mates (Humans) [See Spouses]  
 Mathematical Ability 891  
 Mathematical Modeling 807  
 Mathematics (Concepts) [See Numbers (Numerals)]  
 Mathematics Achievement 1916  
 Mathematics Education 1930, 1945  
 Mating Behavior (Animal) [See Animal Mating Behavior]  
 Maturation [See Human Development]  
 Maturity (Physical) [See Physical Maturity]  
 Maudsley Personality Inventory 1219  
 Maze Learning 514, 535, 585, 621, 627, 684  
 Mazes [See also T Mazes] 733  
 Mean 110  
 Meaning [See also Nonverbal Meaning, Verbal Meaning, Word Meaning] 372  
 Meaningfulness 366  
 Measurement [See Also Related Terms] 14, 263, 754, 755, 808, 818, 1111  
 Media (Mass) [See Mass Media]  
 Mediation (Cognitive) [See Cognitive Mediation]  
 Medical Diagnosis [See also Electrocardiography, Electroencephalography, Electromyography, Electronystagmography, Electoretinography, Galvanic Skin Response, Plethysmography, Pneumoencephalography] 1558, 1572  
 Medical Education [See also Psychiatric Training] 1282, 1308, 1931  
 Medical History [See Patient History]  
 Medical Internship 1268  
 Medical Patients 1326, 1558, 1560, 1615, 1696

- Reconstruction (Learning) 136, 361, 380

# BRIEF SUBJECT INDEX

- Reconstructive Psychotherapy** [See Psychotherapy]  
**Recorders (Tape)** [See Tape Recorders]  
**Recovery (Disorders)** 1345  
**Recreation** [See also Athletic Participation, Basketball, Clubs (Social Organizations), Sports, Summer Camps (Recreation)] 1491, 1809, 2028  
**Recreation Areas** [See Playgrounds]  
**Recreation Therapy** 1803  
**Recreational Day Camps** [See Summer Camps (Recreation)]  
**Red Nucleus** [See Mesencephalon]  
**Reenlistment (Military)** [See Military Enlistment]  
**Referral (Professional)** [See Professional Referral]  
**Reflex (Conditioned)** [See Conditioned Responses]  
**Reflexes** [See also Orienting Reflex] 1510  
**Refraction Errors** [See Myopia]  
**Regression (Defense Mechanism)** 1380, 1610  
**Regression Analysis** [See Analysis of Variance]  
**Rehabilitation** [See also Drug Rehabilitation, Psychosocial Rehabilitation, Vocational Rehabilitation] 718, 1277, 1620, 1737, 1791, 1823, 1824, 1825, 1828, 1829, 1832  
**Rehabilitation (Drug)** [See Drug Rehabilitation]  
**Rehabilitation (Psychosocial)** [See Psychosocial Rehabilitation]  
**Rehabilitation (Vocational)** [See Vocational Rehabilitation]  
**Reinforcement** [See also Differential Reinforcement, External Rewards, Fixed Interval Reinforcement, Fixed Ratio Reinforcement, Internal Rewards, Negative Reinforcement, Positive Reinforcement, Praise, Preferred Rewards, Punishment, Reinforcement Amounts, Reinforcement Schedules, Rewards, Self Reinforcement, Social Reinforcement, Variable Interval Reinforcement, Verbal Reinforcement] 321, 466, 803, 819, 821, 828, 875, 1093, 1378, 1464  
**Reinforcement Amounts** 679, 681, 696, 720, 745  
**Reinforcement Schedules** [See also Fixed Interval Reinforcement, Fixed Ratio Reinforcement, Variable Interval Reinforcement] 331, 668, 681, 697, 704, 707, 708, 716, 721, 734, 735, 736, 738, 747, 792, 834, 898, 1223  
**Relations (International)** [See International Relations]  
**Relations (Peer)** [See Peer Relations]  
**Relaxation** 262, 1714  
**Relaxation Therapy** [See Systematic Desensitization Therapy]  
**Reliability (Statistical)** [See Statistical Reliability]  
**Reliability (Test)** [See Test Reliability]  
**Religion** [See Also Related Terms] 957, 960, 1382  
**Religious Affiliation** [See Christianity, Protestantism, Roman Catholicism]  
**Religious Beliefs** [See also Atheism, Christianity, Protestantism, Roman Catholicism] 612, 961, 965, 1638  
**Religious Education** 955, 972, 1913  
**Religious Practices** [See also Meditation] 956, 964, 1638  
**REM** [See Rapid Eye Movement]  
**REM Sleep** 440, 468, 471, 482, 489, 496, 551  
**Remembering** [See Retention]  
**Reply (To Professional Criticism)** [See Professional Criticism Reply]  
**Repression (Defense Mechanism)** 1783  
**Repression Sensitization** 424, 425  
**Reptiles** [See Lizards, Snakes, Turtles]  
**Research** [See Experimentation]  
**Research Design** [See Experimental Design]  
**Research Methods** [See Methodology]  
**Residency (Medical)** [See Medical Residency]  
**Residential Care Attendants** [See Attendants (Institutions)]  
**Residential Care Institutions** [See also Hospitals, Psychiatric Hospitals] 833, 1239, 1803, 1812, 1840, 1841  
**Resistance (Psychotherapeutic)** [See Psychotherapeutic Resistance]  
**Resistance (Skin)** [See Skin Resistance]  
**Resonance** [See Vibration]  
**Respiration** 118, 467, 769, 943  
**Respiration Stimulating Drugs** [See Caffeine]  
**Respiratory Distress** [See Hyperventilation]  
**Respiratory System** [See Lung]  
**Respiratory Tract Disorders** [See Asthma, Hyperventilation]  
**Respondent Conditioning** [See Classical Conditioning]  
**Response Amplitude** 133, 315  
**Response Duration** 265, 2093  
**Response Frequency** 315, 413, 670, 675, 686, 708  
**Response Generalization** 1967  
**Response Lag** [See Reaction Time]  
**Response Latency** 153, 264, 346, 354, 679, 734, 1557  
**Response Parameters** [See Reaction Time, Response Amplitude, Response Duration, Response Frequency, Response Generalization, Response Latency, Response Probability, Response Set, Response Variability]  
**Response Probability** 44, 264, 317, 350, 389, 447, 2093  
**Response Set** 114, 431, 1181, 1224, 1226  
**Response Speed** [See Reaction Time]  
**Response Time** [See Reaction Time]  
**Response Variability** 141, 900  
**Responses** [See also Conditioned Emotional Responses, Conditioned Responses, Conditioned Suppression, Emotional Responses, Orienting Responses] 343  
**Responsibility** 1105, 1467, 1878, 2077  
**Retaliation** [See Reciprocity]  
**Retardation (Mental)** [See Mental Retardation]  
**Retarded (Mentally)** [See Mentally Retarded]  
**Retention** [See also Recall (Learning), Recognition (Learning), Reconstruction (Learning)] 192, 379, 384, 395, 398, 400, 401, 404, 410, 415, 549, 585, 608, 625, 698, 719, 728, 885, 1497, 1543  
**Retention Measures** [See also Free Recall, Recall (Learning), Recognition (Learning), Reconstruction (Learning)] 338  
**Reticular Formation** 453, 459, 526, 539  
**Retina** [See also Cones (Eye)] 505  
**Retinal Vessels** [See Arteries (Anatomy)]  
**Retirement** 941  
**Retroactive Inhibition** 380, 385, 407, 417, 623, 728  
**Reversal Shift Learning** 331, 616, 672, 744, 855, 865, 1475  
**Review (of Literature)** [See Literature Review]  
**Rewards** [See also External Rewards, Internal Rewards, Preferred Rewards] 1081, 1481  
**Rigidity (Personality)** 1179  
**Risk Taking** 44, 878, 1215  
**Ritalin** [See Methylphenidate]  
**Rites (Nonreligious)** 1690  
**Rites (Religion)** [See Religious Practices]  
**Rites of Passage** 1690  
**Rituals (Nonreligious)** [See Rites (Nonreligious)]  
**Rituals (Religion)** [See Religious Practices]  
**Rod And Frame Test** 47, 48, 143, 1178  
**Rodents** [See also Beavers, Gerbils, Guinea Pigs, Hamsters, Mice, Rats, Squirrels] 643, 750, 784  
**Roentgenography** [See Pneumoencephalography]  
**Role (Counselor)** [See Counselor Role]  
**Role Conflicts** 1104, 1727  
**Role Expectations** 1104, 1285  
**Role Perception** 974, 1013, 1084, 1286, 1899, 2059, 2062  
**Role Playing** 974, 1244  
**Roles** [See also Parental Role, Sex Roles] 913  
**Roman Catholicism** 973  
**Roommates** 1073  
**Rorschach Test** 1224, 1379, 1412  
**Rotary Pursuit** 123  
**Rotation Methods (Statistical)** [See Statistical Rotation]  
**ROTC Students** 2019  
**Rotter Intern Extern Locus Cont Scal** 65, 491, 1226  
**RT (Response)** [See Reaction Time]  
**Runaway Behavior** 1319  
**Rural Environments** 862, 980, 1455  
  
**Saccharin** 673  
**Sadomasochism** [See Masochism]  
**Sadomasochistic Personality** [See Masochistic Personality]  
**Safety** [See Highway Safety]  
**Salamanders** 698  
**Salaries** 1853  
**Sales Personnel** 2054, 2059  
**Saliency (Stimulus)** [See Stimulus Saliency]  
**Salivation** 1207  
**Saltiness** [See Taste Stimulation]  
**Sampling (Experimental)** [See also Random Sampling] 25  
**Sarcomas** [See Neoplasms]  
**Satiation** 321, 480, 519, 665  
**Satisfaction** [See also Job Satisfaction, Need Satisfaction] 430, 941, 1059, 1138, 1171, 1362  
**Scales (Attitude)** [See Attitude Measures]  
**Scales (Intelligence)** [See Intelligence Measures]  
**Scales (Personality)** [See Personality Measures]  
**Scales (Rating)** [See Rating Scales]  
**Scaling (Testing)** 43, 61, 104, 125, 2011  
**Schedules (Learning)** [See Learning Schedules]

# BRIEF SUBJECT INDEX

- Schedules (Reinforcement)** [See Reinforcement Schedules]
- Schizophrenia** [See also Acute Schizophrenia, Catatonic Schizophrenia, Childhood Schizophrenia, Chronic Schizophrenia, Paranoid Schizophrenia] 1315, 1319, 1361, 1367, 1376, 1380, 1385, 1390, 1413, 1419, 1588, 1600, 1610, 1630, 1643, 1646, 1666, 1673, 1718, 1771, 1855
- Schizophrenogenic Family** 1322
- Scholastic Achievement** [See Academic Achievement]
- Scholastic Aptitude** [See Academic Aptitude]
- School Achievement** [See Academic Achievement]
- School Adjustment** 1575, 1867, 1951, 1970, 1977
- School Administration** [See Educational Administration]
- School Administrators** [See also School Principals] 1892, 1899
- School Age Children** 200, 239, 256, 257, 259, 266, 278, 298, 310, 312, 320, 325, 352, 426, 805, 808, 810, 811, 812, 813, 816, 817, 819, 823, 826, 828, 832, 834, 838, 841, 842, 843, 844, 846, 847, 850, 852, 853, 855, 857, 859, 860, 862, 863, 865, 866, 869, 870, 871, 872, 873, 875, 876, 878, 881, 882, 885, 886, 887, 888, 889, 890, 894, 897, 898, 901, 904, 906, 907, 909, 910, 916, 917, 920, 932, 933, 963, 1039, 1089, 1165, 1174, 1223, 1231, 1334, 1391, 1402, 1403, 1418, 1420, 1464, 1475, 1483, 1484, 1486, 1490, 1491, 1492, 1493, 1495, 1507, 1508, 1509, 1510, 1516, 1521, 1543, 1556, 1563, 1699, 1702, 1721, 1767, 1808, 1920, 1957, 1968, 1981, 1982
- School Attendance** 1901
- School Counselors** 1269, 1285, 1986, 2000, 2001
- School Dropouts** 1000
- School Enrollment** [See School Attendance]
- School Environment** 929, 1056, 1864, 1875, 1987
- School Integration (Racial)** 1056
- School Learning** 1266, 1922, 1984
- School Organization** [See Educational Administration]
- School Principals** 1884

- Shock Therapy** [See also Electroconvulsive Shock Therapy] 1818, 1822
- Shopping** [See Consumer Behavior]
- Short Term Memory** 330, 338, 356, 371, 388, 390, 394, 401, 411, 412, 415, 729, 812, 1316, 1468, 1578, 1819
- Sibling Relations** 1451, 1494

# BRIEF SUBJECT INDEX

**Siblings** [See also Brothers, Heterozygotic Twins, Monozygotic Twins, Twins] 1317, 1322, 1435

**Side Effects (Drug)** [See also Drug Addiction, Drug Adverse Reactions, Drug Dependency, Heroin Addiction] 1359, 1646, 1649, 1650, 1673, 1674, 1678, 1680, 1702

**Signal Detection (Perception)** 121, 164, 189, 196, 209, 219, 227, 235, 358, 447, 560, 1389, 2025, 2082, 2095, 2098

**Signal Intensity** [See Stimulus Intensity]

**Significance (Statistical)** [See Statistical Significance]

**Similarity (Stimulus)** [See Stimulus Similarity]

**Simulation** [See Computer Simulation, Markov Chains, Mathematical Modeling, Simulation Games, Stochastic Modeling]

**Simulation Games** 1912

**Sixteen Personality Factors Questionnaire** 46, 1194

**Size (Apparent)** [See Apparent Size]

**Size (Group)** [See Group Size]

**Size Discrimination** [See also Apparent Size] 122, 165, 204, 244, 346

**Skeletal Muscle Relaxant Drugs** [See Muscle Relaxing Drugs]

**Skilled Industrial Workers** 2066

**Skills** [See Ability]

**Skin Conduction** [See Skin Resistance]

**Skin Electrical Properties** [See also Skin Resistance] 444, 1699

**Skin Resistance** 1356

**Sleep** [See also NREM Sleep, REM Sleep] 293, 306, 471, 496, 515, 606, 664, 827

**Sleep Deprivation** 224

**Sleep Disorders** [See Insomnia]

**Sleep Inducing Drugs** [See Hypnotic Drugs]

**Sleep Onset** 283, 489, 631, 1686

**Sleep Treatment** 1818

**Slow Learners** 1472, 1916, 1971

**Slow Wave Sleep** [See NREM Sleep]

**Smell Perception** [See Olfactory Perception]

**Smiles** 420, 937

**Smoking (Tobacco)** [See Tobacco Smoking]

**Smooth Muscle Relaxant Drugs** [See Muscle Relaxing Drugs]

**Snake Phobia** [See Ophidiophobia]

**Snakes** 796

**Social Acceptance** 1364

**Social Adaptation** [See Social Adjustment]

**Social Adjustment** 1002, 1037, 1362, 1371, 1925

**Social Approval** 916

**Social Behavior** [See also Aggressive Behavior, Altruism, Animal Aggressive Behavior, Animal Communication, Animal Courtship Behavior, Animal Distress Calls, Animal Dominance, Animal Maternal Behavior, Animal Mating Behavior, Animal Sexual Receptivity, Animal Social Behavior, Assistance (Social Behavior), Attack Behavior, Attribution, Bargaining, Charitable Behavior, Collective Behavior, Competition, Compliance, Conflict, Conformity (Personality), Conversation, Cooperation, Criticism, Eye Contact, Friendship, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Compatibility, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Involvement, Job Applicant Interviews, Leadership, Leadership Style, Participation, Peer Relations, Praise, Psychodiagnostic Interview, Reciprocity, Responsibility, Risk Taking, Social Acceptance, Social Adjustment, Social Approval, Social Drinking, Social Facilitation, Social Interaction, Social Perception, Social Reinforcement, Verbal Reinforcement, Violence, War] 983, 992, 1040, 1063, 1185, 1450, 1726

**Social Casework** 1682, 1826, 1827, 1830, 1833

**Social Caseworkers** [See Social Workers]

**Social Change** 988, 1298, 1585, 1790

**Social Class** [See also Lower Class, Middle Class, Upper Class] 1017, 1957

**Social Deprivation** [See Social Isolation]

**Social Desirability** 1186, 1226, 1314, 1504

**Social Drinking** 1016

**Social Environments** [See also Animal Environments, Classroom Environment, College Environment, Communities, Environmental Adaptation, Ghettos, Home Environment, Kibbutz, Rural Environments, School Environment, Towns, Urban Environments, Working Conditions] 481, 1157, 1378, 1485, 2023

**Social Equality** 1241, 1265, 1296, 1471, 1932

**Social Facilitation** 753, 773, 1067

**Social Groups** [See also Dyads, Minority Groups] 1072

**Social Influences** [See also Criticism, Power, Prejudice, Propaganda, Social Approval, Social Desirability, Social Values, Superstitions] 138, 426, 1048, 1059, 1061, 1077, 1181, 1598, 1860, 2073

**Social Interaction** [See also Assistance (Social Behavior), Bargaining, Charitable Behavior, Collective Behavior, Conflict, Conversation, Cooperation, Eye Contact, Friendship, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Compatibility, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Job Applicant Interviews, Participation, Peer Relations, Psychodiagnostic Interview, Violence, War] 915, 1053, 1054, 1771

**Social Isolation** 493, 756, 767, 777, 862

**Social Learning** [See also Imitation (Learning), Imprinting] 908, 1743

**Social Maladjustment** [See Social Adjustment]

**Social Movements** [See also Activist Movements, Student Activism, Womens Liberation Movement] 997, 1005, 1014, 1025, 1031

**Social Perception** [See also Attribution] 57, 916, 920, 921, 989, 1011, 1054, 1059, 1066, 1067, 1074, 1080, 1081, 1087, 1088, 1089, 1091, 1096, 1097, 1098, 1099, 1101, 1103, 1107, 1112, 1135, 1174, 1206, 1296, 1342, 1383, 1391, 1400, 1401, 1472, 1481, 1628, 1747

**Social Processes** [See also Coalition Formation, Human Migration, Immigration, Racial Integration, School Integration, Interpersonal Attraction, Interpersonal Communication, Interpersonal Compatibility, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Involvement, Job Applicant Interviews, Leadership, Leadership Style, Participation, Peer Relations, Praise, Psychodiagnostic Interview, Reciprocity, Responsibility, Risk Taking, Social Acceptance, Social Adjustment, Social Approval, Social Drinking, Social Facilitation, Social Interaction, Social Perception, Social Reinforcement, Verbal Reinforcement, Violence, War] 983, 992, 1040, 1063, 1185, 1450, 1726

**Social Casework** 1682, 1826, 1827, 1830, 1833

**Social Caseworkers** [See Social Workers]

**Social Change** 988, 1298, 1585, 1790

**Social Class** [See also Lower Class, Middle Class, Upper Class] 1017, 1957

**Social Deprivation** [See Social Isolation]

**Social Desirability** 1186, 1226, 1314, 1504

**Social Drinking** 1016

**Social Environments** [See also Animal Environments, Classroom Environment, College Environment, Communities, Environmental Adaptation, Ghettos, Home Environment, Kibbutz, Rural Environments, School Environment, Towns, Urban Environments, Working Conditions] 481, 1157, 1378, 1485, 2023

**Social Equality** 1241, 1265, 1296, 1471, 1932

1210, 1385, 1425, 1447, 1484, 1498, 1574, 2035

**Youth (Adolescents)** [See Adolescents]

**Youth (Adults)** [See Young Adults]

**Youth (Children)** [See Children]

**Yugoslavia** 1411

# AUTHOR INDEX

The Author Index is intended to be a name index only and not a person index. "Adams, P" will be listed separately from "Adams, Paul" even though the names may refer to the same person; however, two listings for "Adams, P." may refer to two different authors. All authors are listed, not just primary authors.
